play the instrument to ascertain slight variations in the heat radiation from any object, as the sun or a gas or electric light. This rod is adjusted in a strong frame kept at an equable temperature, so that no expansions or contractions shall exert any influence except those which take place in the vulcanite rod itself. In the chamber which receives one end of this rod or plate there is placed under a follower or slide a piece of carbon, which becomes compressed with great force upon the expansion of the vulcanite rod. If radiant heat is to be measured, a large funnel is placed in front of the apparatus to gather the rays and throw them upon the rod or plate. When the rays increase in intensity the rod expands, compresses the button, and changes its resistance, the variation of which is indicated by a galvanometer. The instrument was used to ascertain the variations in the radiation from the sun during the solar eclipse of July 28, 1878. It may also be used to note the variations taking place on a day when clouds are passing across the sun's disk, or when the transmission of its rays is affected by increase or decrease of moisture. It may be used as a delicate hygrometer by substituting in place of the vulcanite rod a body containing gelatin, which expands under the influence of moisture. The chief disadvantage possessed by this instrument is that the carbon does not regain its original resistance after the pressure is removed. Modern microradiometers and bolometers are, in addition, far more sensitive and are usually employed for the measurement of radiation.

MICROTOME. See MICROSCOPE, and Plate of MICROSCOPE.

MICTLAN. See MITLA.

MIDAS (Lat., from Gk. *Midas*). A common name of the more ancient Phrygian kings, of whom Midas, the son of Gordius (see GORDIAN KNOT) and Cybele, is the most famous. According to one legend he captured Silenus by mixing wine with the water of the fountain at which the god drank, and secured for himself the wisdom of the god. Herodotus tells this story as Macedonian, but later writers transferred it to Phrygia. Another version, told by Ovid, *Metamorphoses*, xi, 85-145, and Hyginus, *Fabulae*, 91, relates that he restored Silenus to Dionysus, and, when asked by the god to name his reward, prayed that whatever he touched might become gold, from which great inconvenience ensued, since even food and drink set before him were changed to gold, so that he was glad to get himself relieved from the burden by washing, at the command of the god, in the Pactolus, the sands of which became thenceforth productive of gold. Another legend represents him as having offended Apollo by assigning the prize in the musical contest to Marsyas, or in later versions to Pan, and as having therefore been endowed by Apollo with a pair of ass's ears. These, concealed under his Phrygian cap, were known only to his barber, who dared tell no man, but, unable to contain his secret, whispered it into a hole in the earth, which he then covered up. His precaution, however, was vain, for the reeds which sprang up at this spot, as they rustled in the wind, proclaimed the news to the world. Some regard this Midas as an ancient Phrygian nature god, probably conceived, like Silenus and other similar fructifying deities, in animal form, but transformed by Greek story-tellers. The story of the ass's ears

is a common folk tale. Consult J. G. Frazer, *The Golden Bough*, part ii (London, 1907), and the article "Midas" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MIDAS. The name of a genus of marmosets, now superseded by other names on the basis of priority, but sometimes the special name of the marakina (*Midas*, or *Leontocebus, rosalia*). See MARMOSET; Plate of MONKEYS, AMERICAN.

MIDDELBURG, mid'el-burk. The capital of the Province of Zeeland, Netherlands, situated on the island of Walcheren, 4 miles north-northeast of Flushing (Map: Netherlands, B 3). It is connected with the sea by a canal 5 miles long, which admits ships of heavy burden. The city is surrounded by a broad canal and has handsome houses, ornamented with gardens; the canals and streets are shaded with trees. The town house, built in the sixteenth century, has a beautiful tower and is decorated with 25 colossal statues of counts and countesses of Holland. It contains a museum with old Dutch portraits. At the beginning of the thirteenth century an abbey was founded here, which was later enriched by William II, Count of Holland and Zeeland. The buildings are now occupied as the meeting place of the provincial states, and contain tapestries representing battles in the Spanish invasion, and biblical scenes. The new church contains a monument to William II of Holland. The town possesses a dry dock, corn exchange, provincial library, a Gymnasium, a high school, and a normal school, and is the seat of several learned societies, with important collections of antiquities and objects of local interest. The city's commerce was formerly very large. It has some inland trade in grain, potatoes, and madder, and manufactures of cotton goods. Pop., 1903, 19,002; 1910, 19,560. Middelburg was a Hanse town in the Middle Ages, having received its charter in 1225. In 1574, during the war for independence, it was captured by the Dutch from the Spaniards after a siege of two years. It suffered heavily during the wars between England and France in the beginning of the nineteenth century. It was formerly the capital of the province.

MIDDELBURG, PAUL OF. See PAUL OF MIDDELBURG.

MIDDELSCHULTE, mid'el-shul'te, WILHELM (1863-). An American organist and composer, born at Dortmund, Westphalia, Germany. He was educated at the Royal Academy of Church Music in Berlin under Haupt, Loeschorn, and Julius Alsleben. He served as organist of St. Lucas's Church, Berlin (1888-91); then settled in Chicago, where he was organist of the cathedral of the Holy Name (1891-95) and of St. James's (Roman Catholic) Church after 1899. After 1894 he was organist for the Thomas Orchestra, and in 1899 he added to his other duties those of director and professor of organ and musical theory at the Wisconsin Conservatory of Music, Milwaukee. He composed *Passacaglia in D Minor*, *Toccata*, and a concerto, a fugue, and a fantasia on themes by Bach.

MIDDENDORFF, mid'en-dörf, ALEXANDER THEODOR VON (1815-94). A Russian traveler and naturalist. He was born in St. Petersburg and studied medicine in Germany. With Baer, in 1840, he went on an ornithological expedition into Lapland, and in 1844-45 made an important trip in northeast Siberia. He again journeyed in Siberia in 1869, accompanied by the Grand

Duke Vladimir; and he also made journeys to Asiatic Turkey and many of the islands off the coast of Africa. His journeys were detailed in government reports and in his book, *Reise in den äussersten norden und osten Sibiriens* (1848-75). He was a member of the St. Petersburg Academy (zoölogical section) and for some time its secretary; founder of the Russian Geographical Society; and in 1846 gold medalist of the London Geographical Society.

MIDDLE AGES. The designation applied to the historical period between the times of classical antiquity and modern times. The beginning and close of this period are not well agreed upon. It is usual, however, to regard the Middle Ages as beginning with the overthrow of the Western Roman Empire by the barbarians in the fifth century and ending at the close of the fifteenth century or the beginning of the sixteenth century. Some scholars prefer to regard the Renaissance (q.v.) as the beginning of modern history. By some, who prefer to use precise landmarks, the Middle Ages are made to extend from the deposition of the Roman Emperor by Odoacer in 476 to the fall of the Byzantine or Greek Empire in 1453, when Constantinople was taken by the Turks. Others again make the Middle Ages terminate with the discovery of America in 1492. The term Dark Ages formerly was frequently used to cover the greater part of the Middle Ages, the designation being applied by some to the period from the fifth to the eleventh century and by others made to embrace all but the last two centuries of the Middle Ages.

In 395 A.D. the Emperor Theodosius died, leaving two sons, one to rule in the West, the other at Constantinople. But in theory there was a single Roman Empire, embracing practically the whole Christian world, extending from the Atlantic to the Euphrates, from the Rhine and the Danube to the great Sahara, with a single government and the same system of laws. Christianity was the recognized state religion. The Roman civilization was in many respects uniform throughout the Empire; a great network of roads bound all the parts together. In the fifth century the Germanic barbarians overran the Western Empire and settled as conquerors in various parts. Thus the three most important factors which were to influence the civilization of western Europe during the early Middle Ages were the Roman, the Christian, and the German. The Roman civilization had absorbed much of Greek art, Greek literature, Greek philosophy, and Greek science. It had developed to a marvelous degree a system of administration and law. It had so completely assimilated the various races in the Western Empire that they were proud to be called Romans. The Christian Church had brought in high ideals and had taught new duties. But at the same time it exalted asceticism, and had a tendency to oppose everything pagan which conflicted with the teachings of the Church. Much of the classical literature and art was under the ban of the Church, because these were intimately associated with the pagan religions. Consequently the Church diminished the inheritance which the Middle Ages would otherwise have received. On the other hand, the Church adopted the magnificent Roman system of administration and thus became a great centralizing governmental force. The German barbarians contributed to the mediæval civilization certain ideas of freedom and of the im-

portance of the individual, as shown in their public assemblies, but the most important contribution was the Germans themselves, a strong race, capable of rapid advance, and always ready to assimilate itself to surrounding conditions. Furthermore, those who settled in the Empire were relatively few in number, and consequently were profoundly influenced by the more numerous population among which they dwelt.

The fifth and sixth centuries were marked by the migrations of the German nations. One tribe after another broke through the Roman frontier and carved out a territory for itself. By 600 almost the whole of the former Western Empire was in the power of the Germans. During the seventh and eighth centuries the Romanic population and the barbarians were going through a process of fusion. By 800 the two formed practically a homogeneous society of a composite nature. The civilization was far higher than that of the early Germans, far lower than that of the Romans. During this period the Church was converting and bringing under its authority the various peoples of the North and West. (See FRANKS.) Its monks were missionaries of culture and also political agents of great importance in binding the separate nations to Rome. From 800 there was again a Roman Empire in the West. (See CHARLES THE GREAT.) Although the Carolingian Empire soon disintegrated, its brief existence had been of great importance as a precedent and had had a lasting effect upon the relations between the Germans and the Roman Catholic church. In the states which arose with the disruption of the Frankish realm the absence of a strong central government threw each district upon its own resources. Local rulers arose, defended their territories against invaders, and maintained a semblance of order. These leaders were sometimes bishops or abbots, sometimes lay nobles. The power fell into their hands. (See FEUDALISM.) The Church was the only bond of union and the only restraining force in the disturbed conditions of the times. It became a mighty engine of government, whose interests were by no means restricted to religious matters. From this time until the close of the thirteenth century the Church was the most important factor in mediæval history. Its authority, wealth, and influence increased constantly; its members were prominent in every sphere of activity.

In the latter half of the tenth century Otho the Great (q.v.) more closely connected the fortunes of Germany and Italy by restoring the Empire of Charles the Great. His action was to result in weakness and disunion for both countries, but for three centuries the German monarch was apparently the leading power in western Europe. During this period the Normans (q.v.) conquered England, southern Italy, and Sicily, and strong monarchies began to develop in England, France, and Spain. Ever since the early part of the eighth century Christendom had been waging a fierce warfare against the Mohammedan power in the West. At the close of the eleventh century began a great onslaught of western Europe upon the Mohammedan power in the East, known as the Crusades (see CRUSADE). The broadening of the horizon, the resultant skepticism, and the enrichment of Europe, which resulted from the Crusades, caused the progress in many lines to be more rapid. The twelfth and thirteenth centu-

ries were periods of great intellectual activity, marked by the foundation of universities, the prevalence of heresy, the development of vernacular literatures, the rise of cities, and the growth of national feeling. The following centuries are generally designated the period of the Renaissance (q.v.).

It is difficult to describe the Middle Ages as a whole, because there was a constant evolution for over 1000 years. The characteristics which contrast most sharply with those of the classical world are these: in the Middle Ages the civilization as a whole was much ruder and mixed with barbaric elements; the individual was of greater importance than the state; men were dominated by a militant, vital religion. If contrasted with the modern period which followed, the Middle Ages were a period when the human intellect was restricted by a deference to the authority of tradition in every phase of life, a deference which was wholly at variance with a critical and skeptical attitude of thought. Again, the physical world, the world of investigation, the world of action, were very limited for the mediæval man. The discoveries at the close of the fifteenth century which disclosed new continents were coincident with the development of the printing press, the revolution in warfare due to the introduction of gunpowder, and the discoveries in the various sciences which opened new worlds of thought and activity. The important artistic activity of the Middle Ages falls into three distinct epochs, the Early Christian (see CHRISTIAN ART), Romanesque, and Gothic, under which titles the art of the period is treated.

MID'DLEBORO. A town, including several villages, in Plymouth Co., Mass., 35 miles by rail south by east of Boston, on the Nemasket River and on four branches of the New York, New Haven, and Hartford Railroad (Map: Massachusetts, F 5). It has a public library, is an attractive summer resort, and is noted as an industrial centre. Its manufacturing interests are represented by several large shoe factories, woolen mill, paper-box factory, saw and planing mills, and varnish factories. The town receives the income of about \$500,000, bequeathed to it by Thomas S. Peirce, a former citizen. The government is administered by town meetings. Middleboro owns its gas and electric-light plants. Pop., 1900, 6885; 1910, 8214; 1914 (U. S. est.), 8778. Settled about 1662 on the site of an old Indian village, Nemasket, Middleboro was incorporated in 1669. Consult Barber, *Historical Collections of Massachusetts* (Worcester, 1840), and Thomas Weston, *History of the Town of Middleboro* (Boston, 1906).

MID'DLEBURY. A village and the county seat of Addison Co., Vt., 34 miles north by west of Rutland, on the Rutland Railroad (Map: Vermont, B 4). The village is situated in the Otter Creek valley, near the Green Mountains, in a region of picturesque scenery. It is the seat of Middlebury College (q.v.), and has the Sheldon Art Museum and Library, a public library, and a fine courthouse and opera house; also attractive fair grounds. The industries are represented by agricultural interests and by several marble quarries, marble mills, limekilns, and flour, saw, door, sash, and pulp mills. The village possesses valuable water power. Under a revised charter of 1877 Middlebury village is governed by a board of trustees, chosen annually, who elect subordinate administrative officers. Pop. (village), 1900, 1897; 1910, 1866. Middlebury was founded in 1773, but, owing to threatened attacks from the English and the Indians, was almost completely deserted during the Revolutionary War. In 1813 it was incorporated as the borough, and in 1832 as the village of Middlebury. Consult Swift, *History of the Town of Middlebury* (Middlebury, 1859).

MIDDLEBURY COLLEGE. An institution for higher learning, founded at Middlebury, Vt., in 1800, and which is under no denominational control. The trustees are elected for life and are not restricted in the choice of their successors. The departments of instruction include French, German, economics, history, political science, pedagogy, philosophy, physics, mathematics, chemistry, biology, geology, home economics, drawing and surveying. The attendance in all departments in 1914-15 was 340, with 31 instructors. The original campus of the college, which was presented to the corporation by Col. Seth Storrs in 1810, was increased in 1908 by a gift from Col. Joseph Battell of 35 acres adjoining. This is used as a site for buildings

for women. In 1912 a further gift of 79 acres was received for the Porter Athletic Field. There are 13 buildings on the campus, of which the most important are Painter Hall (1815), Starr Hall (1861), the chapel (1836), Egbert Starr Library (1900), Warner Science Hall (1901), Hamlin Commons (1882), McCullough Gymnasium (1912), Music Hall (1913), and the Chemistry Building (1913). The State of Vermont in 1908 established a department of pedagogy for the training of high-school teachers, which department is sustained by an annual appropriation. Middlebury College was on the first list of accepted institutions of the Carnegie Foundation and has received a grant from the General Education Board. In 1915 the Mead Memorial Chapel was presented by John A. Mead, former Governor of the State. The college has been coeducational since 1883, but in 1902 a charter was granted by the Legislature authorizing the establishment by the corporation of a separate college for women. The grounds and buildings of the college are valued at \$430,000 and the entire property at \$1,070,000. The library contains about 45,000 volumes. The president in 1915 was John M. Thomas, D.D., LL.D.

MIDDLE C. In music, the note *c*¹, which is on the first leger line below the treble staff,

The C clef always represents the note termed middle C, and the lines and spaces above or below are designated accordingly. See **MUSICAL NOTATION, The Clefs.**

MIDDLE EAR, INFLAMMATION OF. See **OTITIS MEDIA.**

MIDDLE ENGLISH. See **ENGLISH LANGUAGE; ENGLISH LITERATURE.**

MIDDLE KINGDOM. A native name of China, believed by its inhabitants to be the middle point of the earth.

MIDDLE LATITUDE SAILING. See **SAILINGS.**

MID'DLEMARCH. A novel by George Eliot (1872). It appeared serially in *Blackwood's Magazine* in 1871. The author considered this story of a provincial town her greatest work. It consists of two stories, that of the Vincy family and that of Dorothea Brooke, who is the chief character.

MID'DLESBORO. A city in Bell Co., Ky., 64 miles north by east of Knoxville, Tenn., and on the Louisville and Nashville and the Southern railroads (Map: Kentucky, G 6). It has considerable reputation as a summer resort, and contains a Carnegie library, the W. K. Evans Hospital, and commodious city hall and courthouse buildings. The chief industrial establishments include ironworks, coal mines, and a brewery. Pop., 1900, 4162; 1910, 7305.

MIDDLESBROUGH, mid'd'lz-b'rūh. A manufacturing town, port, and parliamentary and county borough in the North Riding of Yorkshire, England, near the mouth of the Tees, 48 miles north of York (Map: England, E 2). It is the centre of the Cleveland iron district, one of the largest in the world. The town is well built, with handsome specimens of architecture, including the town hall with library, a memorial museum, and a Roman Catholic cathedral. In the Royal Exchange, a fine building, the weekly iron market is held on Tuesdays, attended by persons connected with the iron trade from all

parts of the Kingdom, as well as foreigners. It is the headquarters of a Roman Catholic bishop. Albert Park, containing 72 acres, is tastefully laid out. The town owns its water, gas, abattoirs, markets, and cemeteries, and maintains baths, washhouses, and free libraries. Middlesbrough was founded in 1830. The opening of the docks in 1842 gave it additional importance. From the year 1852, when iron ore was discovered in the Eston Hills, the town increased rapidly and has acquired an important position as an iron-manufacturing centre, turning out over 2,500,000 tons per year of pig iron alone, and having smelting furnaces on an extensive scale, iron foundries, manufactures of rails, locomotive engines, tubes, boilers, wire, chemicals, salt, oil, and pottery. Shipbuilding is extensively carried on. There are spacious docks, and a breakwater nearly 2½ miles long. The harbor accommodates vessels with a draft of 32 feet. The tonnage entered and cleared, excluding coastwise vessels, was 3,225,000 in 1911. Middlesbrough was incorporated in 1853. Pop., 1901, 91,302; 1911, 104,767. Consult H. G. Reid, *Middlesbrough and its Jubilee* (Middlesbrough, 1881).

MID'DLESEX. The metropolitan county in the southeastern part of England, bounded north by Hertfordshire and south by Surrey (Map: England, F 5). Next to Rutland it is the smallest of the English counties, with an area of 283 square miles, 50 square miles of which comprises a part of metropolitan London. It is generally flat, being watered by the Thames, Colne, Lea, and Brent. Outside of London the land is chiefly devoted to grass and hay farms and to market gardens, the produce of which is sent to supply the metropolis. Capital, Brentford. Pop., 1901 (excluding the metropolitan area), 798,738; 1911, 1,126,465.

MIDDLE TEMPLE. One of the four great guilds or societies of barristers in England, known as Inns of Court. The Inns of the Middle Temple are so called from the group of ancient buildings in London occupied by them, which were the seat of the Knights Templars and passed into the hands of the lawyers after the dissolution of that famous order of chivalry. They are grouped with the buildings of the three other Inns near the Law Courts. See **INNS OF COURT.**

MID'DLETON. A municipal borough and market town in Lancashire, England, in the valley of the Irk, 6 miles north of Manchester (Map: England, D 3). Its chief industries are the manufacture of cotton, silk, soap, chemicals, and machinery. Much coal is mined near by. It has a fifteenth-century church, a grammar school dating from 1572, a fine town hall, and a technical school. The municipality owns gas works, electric-lighting plant, markets, and public baths, and maintains free library, park, recreation grounds, and a sewage farm. Pop., 1901, 25,180; 1911, 27,980.

MIDDLETON, ARTHUR (1681-1737). An American colonist, born in South Carolina. He was educated in England. After his return to his native Colony he was elected a member of the Commons House, was appointed naval officer for the Colony (1711), member of the Provincial Council (1711-17), and afterward Speaker of the Commons. In 1719 he was president of the convention which took the government of the Colony away from the Lords and placed it directly under the crown. Later he became

president of His Majesty's Council, and as such was acting Governor from 1725 until the arrival of the first regularly appointed royal Governor in 1731. Middleton was an uncompromising supporter of the royal authority.

MIDDLETON, ARTHUR (1742-87). A signer of the Declaration of Independence, grandson of Arthur Middleton (1681-1737). He was born in South Carolina. In 1754 he went with an uncle to England, where he was educated at Harrow, Westminster School, and St. John's College, Cambridge. He returned to South Carolina in 1763, settled at Middleton Place, on Ashley River, became a justice of the peace, and from 1765 to 1766 served in the Commons for St. Helena. He then again went abroad and spent three years in England and southern Europe. On his return in 1772 he was again elected to the Commons, and in 1774 became a member of the Upper House of the Provincial Congress. He was one of the ablest and boldest opponents of the royal authority, and early in 1775 became a member of the Secret Service Committee and in June of the same year of the Council of Safety. Early in 1776 he helped frame a constitution for the State, and later in the same year he was sent as a delegate to the Continental Congress and signed the Declaration of Independence. In 1778 he was elected a member of the State Legislature and was also chosen Governor and commander in chief of South Carolina, but refused to serve. He assisted in the defense of Charleston, and upon the capture of that place was imprisoned in St. Augustine and later in the prison ship *Jersey*. Being exchanged in July, 1781, he was again elected to the Continental Congress, where he served until peace was declared. Later he became a member of the State Senate and a trustee of Charleston College. Middleton was a man of much energy and judgment, an able debater, and a forceful writer. Under the pseudonym of "Andrew Marvel" he wrote a number of effective political essays; he also left stenographic reports of many of the debates in which he participated.

MIDDLETON, CONYERS (1683-1750). A divine of the Church of England. He was born Dec. 27, 1683, at York or Richmond in Yorkshire. He studied at Cambridge, where he took the degree of B.A. in 1702, was elected a fellow in 1706, and shortly after married a lady of fortune. The views he expressed and defended were generally such as to draw down upon him the imputation of being an "infidel in disguise," though some of them—such as that the Jews borrowed some of their customs from Egypt, that the primitive writers in vindicating Scripture found it necessary sometimes to recur to allegory, and that the early stories of Genesis are not literal history—are now commonly held. Middleton died at Hildersham in Cambridgeshire, July 28, 1750. His controversial writings are acute, but marred by bitterness. His principal writings are: *A Letter from Rome, Showing an Exact Conformity between Popery and Paganism; or the Religion of the Present Romans Derived from that of their Heathen Ancestors* (1729), which provoked the most violent indignation among Roman Catholics, and *The History of the Life of M. Tullius Cicero* (2 vols., 1741). All his pamphlets, treatises, etc., were collected and published under the title of *Miscellaneous Works* (4 vols., London, 1752). Consult Leslie Stephen, *English Thought in the Eighteenth Century* (London, 1876).

MIDDLETON, SIR FREDERICK DOBSON (1825-98). A British soldier. He was born in Belfast, Ireland, and, graduating at the Royal Military College at Sandhurst in 1842, saw active service in New South Wales, New Zealand, Burma, and India. In the Indian Mutiny (1857-58) he was decorated with the Victoria Cross for gallant conduct. In 1868 he accompanied his regiment to Canada, but returned to England in 1870. In 1884 he returned to Canada as commander in chief of Canadian militia, and in 1885 he energetically suppressed the Riel rebellion in the Northwest, for which he received from the Canadian Parliament a grant of \$20,000 and the honor of knighthood from the Queen. In 1890 he returned to England, and in 1896 was appointed keeper of the crown jewels.

MIDDLETON, GEORGE (1880-). An American playwright, born at Paterson, N. J. He graduated from Columbia University in 1902. In 1911 he married Fola La Follette, an actress and writer, the daughter of Robert M. La Follette (q.v.), and a year later became literary editor of *La Follette's Weekly*. His plays, several being dramatized novels, include: *The Cavalier* (1902), with Paul Kester; *The Wife's Strategy* (1905); *The Sinner* (1907); *The House of a Thousand Candles* (1908); *Rosalind at Red Gate* (1910); *The Enemy* (1911); *The Prodigal Judge* (1913). He published: *Embers* (1911), *Tradition* (1913), and *Possession* (1915), all three volumes containing one-act plays; and *Novadays* (1914), a comedy.

MIDDLETON, HENRY (1717-84). An American patriot, born in South Carolina, a son of Arthur Middleton (1681-1737). He was elected to the Commons and served as Speaker of that body in 1745-47 and in 1755-70 he was a member of the Council. He was a delegate to the Continental Congress (1774), serving as president of that body from October of that year to May, 1775. He was also president of the Provincial Congress of South Carolina in 1775-76, and was one of a committee of 11 to prepare a plan of government until the dispute between Great Britain and the colonies could be settled; was elected a member of the Legislative Council in 1776, later of the Council of Safety, and was chosen to the Senate of South Carolina under the new constitution of 1778. He was a wealthy planter and slave owner and a man of marked public spirit.

MIDDLETON, HENRY (1771-1846). An American statesman and diplomat, the son of Arthur Middleton (1742-87). He was born in Charleston, S. C., was carefully educated by private tutors and at South Carolina College, and in 1801 was elected to the South Carolina Legislature, where his brilliant powers as an orator attracted wide attention and led, in 1810, to his election as Governor of the State. He held this office until 1812, was a strong supporter of the war policy of the Madison administration, and in 1815, after a brief retirement from politics, was elected to Congress, serving until 1820. In that year he was appointed by President Monroe Minister of the United States to Russia, where in a service of 10 years he did much to strengthen the commercial relations between the two nations, negotiating in 1824 the first treaty which provided for the regulation of trade and fisheries in the Pacific. On his return to America in 1830 he retired from public life.

MIDDLETON, JOHN HENRY (1846-96). An English classical scholar, born at York. He studied at Cheltenham College and at Exeter College, Oxford, but ill health prevented his graduating. During this period he read widely in the fields of art and archaeology. Afterward he traveled in various parts of the world and returned to become a partner of his father (an architect) at Westminster. In 1886 he was elected Slade professor of fine art at Cambridge, where three years later he became director of the Fitzwilliam Museum. Appointed art director of the South Kensington Museum, London, he carried out various important reforms. He wrote *Ancient Rome* (1885; rev. ed., 1888) and *The Remains of Ancient Rome* (2 vols., 1892), valuable works, giving among other things an excellent account of the building materials used by the Romans and of their methods of constructing walls, arches, buildings, etc. Middleton also published descriptions of collections in the Fitzwilliam Museum.

MIDDLETON, THOMAS (?1570-1627). An English dramatist, born probably in London. Hardly a detail of his life is known. He seems to have studied law, and may thus be one of the two Thomas Middletons entered at Gray's Inn in 1593 and 1596. It is thought that he began writing for the stage as early as 1599, but the first mention of him is in Henslowe's *Diary*, on May 22, 1602. He was then collaborating with Munday, Drayton, Webster, and others on a lost play called *Cæsar's Fall*. In this year he published a comedy entitled *Blurt, Master-Constable*, and in 1603-04 two prose tracts, *The Black Book* and *Father Hubbard's Tales*, lively and highly colored satirical sketches of London life. Between this time and his death he wrote more than 20 plays and 12 masques and pageants. In 1620 he was made chronologer to the city of London. He died in London near July 1, 1627. He was successful in both comedy and tragedy. His humor is seen at its best in *A Trick to Catch the Old One* (1608); *The Roaring Girl* (1611); *The Spanish Gypsy*, a tragi-comedy (acted as early as 1623, but not printed till 1653); *A Chaste Maid in Cheapside* (not printed till 1630). All except the third in this list depict contemporary London life. The second has as heroine the notorious Mary Frith, known as Moll Cutpurse. Middleton's dramatic power is at its height in *Women Beware Women* (first printed in 1657). It is a romantic tragedy founded in part on the history of Bianca Capello. Almost equal to this play are *The Spanish Gypsy*, cited above, and *The Changeling* (printed 1653), considered by some the most powerful of all the plays with which Middleton's name is connected. *A Game at Chess*, a political drama, attacking Spain, aroused such enthusiastic hatred that the Spanish Ambassador protested, and the piece was taken off the stage after scoring a great success (1624). A play called *The Witch* (printed 1778) is of considerable interest because it has the same motive as Shakespeare's *Macbeth*. Middleton is in the forefront of the group of greater Elizabethan dramatists, and there is little, outside the work of Shakespeare himself, which can match the best of his scenes, tragic or comic. The lack of care evident in his plays makes it impossible for them to take the highest rank. Consult: *Works*, edited by Alexander Dyce (5 vols., London, 1840); *Works*, edited by A. H. Bullen (8 vols.; ib., 1886);

selections from the plays, edited by Havelock Ellis, with an introduction by Swinburne, for the "Mermaid Series" (ib., 1887); P. G. Wiggan, *Inquiry into the Authorship of the Middleton-Rowley Plays* (Boston, 1897); D. H. Jung, "Das Verhältnis Thomas Middletons zu Shakspeare," in *Münchener Beiträge zur romanischen und Englische Philologie* (Munich, 1904); F. G. Fleay, *Biographical Chronicle of the English Drama, 1559-1642* (2 vols., ib., 1891); A. W. Ward, *History of English Dramatic Literature* (rev. ed., New York, 1899).

MIDDLETON, THOMAS FANSHAW (1769-1822). Bishop of Calcutta. He was born in Kedleston, Derbyshire, England; was educated at Christ's Hospital, and graduated at Pembroke College, Cambridge, in 1792; was ordained to a curacy in Gainsborough in 1792, and in 1795 became rector at Tansor, Northamptonshire, and in 1802 at Bytham, Lincolnshire. He exchanged these in 1811 for the curacy of St. Pancras, London. In 1814 he was consecrated first Bishop of Calcutta, where he did much to promote the advancement of Christianity and education, founded the Bishop's Mission College in 1820, and established a consistory court. He was editor for short periods of the *Country Spectator* at Gainsborough and the *British Critic* (new series) in London. The work by which he was best known was that on *The Doctrine of the Greek Article Applied to the Criticism and Illustration of the New Testament* (1808). Consult C. W. Le Bas, *Life of Bishop Middleton* (London, 1831).

MIDDLETOWN. A city and the county seat of Middlesex Co., Conn., 16 miles south of Hartford, on the Connecticut River and on the New York, New Haven, and Hartford Railroad and the line of the Hartford and New York Transportation Company (Map: Connecticut, E 3). It is connected with the opposite town of Portland, known for its brownstone quarries, by an unusually long drawbridge. Middletown is the seat of Wesleyan University (q.v.); the Berkeley Divinity School (Protestant Episcopal), opened in 1854; the State Hospital for the Insane; and the State Industrial School for Girls. Other features are the municipal building, Middlesex Hospital, and the Russell Free Library. The city has considerable trade, as the river is navigable as far as Hartford for light-draft steamers, thus increasing the transportation facilities. Middletown is also an important industrial centre, with manufactures of cotton webbing, hammocks, pumps and pump machinery, marine hardware, locks, woolen blankets, dress shields, canopies, belting, paper boxes, electrical appliances, toys, boots and shoes, chemicals, silver-plated ware, rubber, bone, silk goods, etc. There are valuable mineral deposits in the vicinity, and the region is rich in fruit and tobacco. Middletown is governed, under a charter of 1882, by a mayor, elected biennially, and a city council, chosen on a general ticket. The water works are owned and operated by the municipality. Pop., 1910, 11,851; 1914 (U. S. est.), 12,815.

Founded in 1650 and incorporated as a town under the name of Mattabeseck in 1651, Middletown received its present name in 1653 and was incorporated as a city in 1784. Previous to the Revolution and for some time thereafter it was a very important commercial port, a large number of its citizens being engaged in the West Indian trade. For many years prior to 1886,

when the Custom House was moved to Hartford, it was a port of entry. Consult: Whittemore, *History of Middlesex County, Connecticut* (New York, 1884); an article on "Middletown," in the *Connecticut Quarterly* (Hartford, 1898); C. C. Adams, *Middletown Upper Houses: A History of the North Society of Middletown from 1650 to 1800* (New York, 1908).

MIDDLETOWN. A town in Newcastle Co., Del., 25 miles south-southwest of Wilmington, on the Philadelphia, Baltimore, and Washington Railroad and on the Appoquinomink River. (Map: Delaware, H 2). It has considerable fruit-canning interests, owing to its location in the noted fruit-growing belt of the State, also creameries and vegetable canneries, and manufactures farming implements, shirts, etc. There are municipal water works and an electric-light plant. Pop., 1900, 1567; 1910, 1399.

MIDDLETOWN. A city in Orange Co., N. Y., 67 miles northwest of New York City, near the Wallkill River and on the Erie, the New York, Ontario, and Western, and the Middletown and Unionville railroads (Map: New York, Insert A 1). It is the seat of a State Hospital for the Insane, the largest homeopathic institution in the United States, and has a public library and fine high-school and Federal buildings. The centre of an agricultural and dairying district, Middletown enjoys a considerable trade in the products of the region; and among its industrial establishments are straw-hat factories, car shops (N. Y., O., and W.), saw and file works, cigar factories, a tannery, a milk condensery, and manufactories of shirts, automobile tires, wrapping machines, and cut glass. The city owns and operates the water works. Pop., 1900, 14,522; 1910, 15,313; 1914, 15,650 (excluding over 2000 State Hospital patients); 1920, 18,420. Settled before the Revolution and named from its central location between Montgomery and Mount Hope, Middletown was incorporated as a village in 1848 and was chartered as a city in 1888. Its situation as the halfway station between the Hudson and the Delaware rivers, on the old Minisink road leading to the "far West" of New York State, made it of considerable importance in the later years of the eighteenth and the early years of the nineteenth century; while its position as a terminal of the Erie Railroad and the consequent establishment of a foundry about 1845 gave it a start as an industrial centre.

MIDDLETOWN. A city in Butler Co., Ohio, on the Miami River and the Miami and Erie Canal, 34 miles north of Cincinnati, on the Cleveland, Cincinnati, Chicago, and St. Louis, the Cincinnati, Hamilton, and Dayton, the Cincinnati Northern, and other railroads (Map: Ohio, B 7). It has a public library, a hospital, a government building, and a fine opera house; and there are extensive manufactures of tobacco, paper, bicycles, steel, steel sheets, iron, motor cycles, paper machinery, gas engines, and paper boxes and bags. The water works are owned by the municipality. Middletown was settled as early as 1794, and in 1913 adopted the commission form of government. Pop., 1900, 9215; 1910, 13,152; 1914 (U. S. est.), 14,827; 1920, 23,594.

MIDDLETOWN. A borough in Dauphin Co., Pa., 9 miles southeast of Harrisburg, on the Susquehanna River and on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, H 7). It is in a farming region

and has flouring and planing mills, stove works, car shops, and shoe, hosiery, cigar, and furniture factories, the products of which constitute a considerable export trade. The electric-light plant is owned by the municipality. Middletown was founded in 1755 and was incorporated as a borough in 1828. Pop., 1900, 5608; 1910, 5374.

MIDDLE TOWN INDIANS. See MIWOK STOCK.

MIDDLE VOICE. See DEFONET; GRAMMAR, near the end.

MIDDLINGS. See FLOUR.

MIDEWIN, mē'dē-win, or **MIDEWIWIN**, mē'dē-wē'win, or **MIDE**, mē'dē, **SOCIETY**. A secret organization found among many Algonquian (q.v.) Indian tribes, consisting of progressive degrees or ranks having some vague resemblance to the Masonic ritual. In the public initiation ceremonies the candidates spit up shells as proof of their having been magically shot into their bodies, or symbolic of the spiritual influence of the ritual. Consult W. J. Hoffman, in *Bureau of American Ethnology, Seventh Annual Report* (Washington, 1891).

MIDGE (AS. *mycg*, OHG. *muccō*, Ger. *Mücke*, Icel. *my*, midge, fly; connected with Gk. *μυία*, *myia*, fly). The popular name of the little flies of the family Chironomidae, applied also in Europe to the Simuliidae, which in this country are called black flies and buffalo gnats. There is nothing very specific in the use of the name, and it is generally applied to almost any minute flying insect, most of which are true flies.

MIDHAT PASHA, mē'd'hāt' pā-shā' (1822-84). A Turkish statesman, born in Constantinople. His origin was humble, but his marked ability secured him rapid promotion in the Ottoman civil service. He visited England and France; was made a Pasha; governed Bulgaria and other provinces with energy and wisdom; and in 1872 was named Grand Vizier. He had already identified himself with the progressive party known as Young Turkey and was disliked and feared by the reactionaries. He took a leading part in the conspiracy which led to the dethronement of Abd-ul-Aziz (May 30, 1876) and was made Grand Vizier, Dec. 20, 1876, by Abd-ul-Hamid II, but was dismissed and banished in February, 1877. A constitution which he had promulgated failed. Later he was permitted to return, and became Governor of Syria and then of Smyrna. In 1881 he was tried, with others, upon the charge of murdering Abd-ul-Aziz and was condemned to death, but the sentence was commuted to perpetual banishment when Great Britain interfered. He died in Arabia, May 8, 1884. He was the author of *La Turquie, son passé, son avenir* (Paris, 1878); Consult: B. Brunswick, *La vérité sur Midhat Pasha* (Paris, 1877); L. A. Léouzon Le Duc, *Midhat Pasha* (ib., 1879); Ali Haydar Midhat, *The Life of Midhat Pasha: A Record of his Services, Political Reforms, Banishment, and Judicial Murder* (London, 1903).

MIDIANITES, mid'i-an-its. The name of a Semitic people. According to Gen. xxv. 2, Midian, the eponymous ancestor, is a son of Abraham through his wife Keturah. That the Midianites are to be reckoned with the Arabs is clear. We find them now at Mount Sinai (Ex. iii. 1), again to the east of Israel (Gen. xxv. 4); in the days of Gideon they advance from the Syrian Desert (Judg. vi), and in Num. xxv. 6-9 they are represented as occupying a portion of Moab. They were evidently in the

main a nomadic people whose general habitat was a region including the northern portion of Hejaz and the fringe of the Syrian Desert east of Edom and Moab. The Midianites east of the Gulf of Akabah seem to have been a pastoral people, while those farther north, whose attacks are described in Judges vi-viii, make the impression of Bedouin hordes. According to Ex. iii. 1, Moses's father-in-law, Jethro, was a Midianitish priest. Grimme has suggested that Midian is mentioned under the form Midhi in a Minaean inscription (Halevy, 535; Glaser, 1155). The land of Midian extended northward from Horeb, or Sinai, close to the eastern shore of the Gulf of Akabah. A place called Madiana is mentioned by Ptolemy close to the Red Sea and about opposite the extremity of the Sinaïtic Peninsula, and no doubt this stands in some relationship in the original application of Midian in the Old Testament. Consult: R. F. Burton, *Gold Mines of Midian* (London, 1878); id., *Land of Midian Revisited* (2 vols., ib., 1878-79); Grimme, *Die Weltgeschichtliche Bedeutung Arabiens: Mohammed* (Munich, 1904).

MIDLAND. A town in Simcoe Co., Ontario, Canada, on Georgian Bay and on the Grand Trunk Railway (Map: Ontario, E 4). A line of steamboats runs to Parry Sound. Midland's industrial establishments include three grain elevators, four lumber mills, a blast furnace, iron smelters, woolen and flour mills, engine works, a box factory, a shipbuilding yard, and foundry and machine shops. Power for manufacturing is supplied from the Severn River. Pop., 1901, 3174; 1911, 4663.

MIDLAND. A city and the county seat of Midland Co., Mich., 20 miles northwest of Saginaw, at the junction of the Tittabawassee and Chippewa rivers and on the Pere Marquette and Michigan Central railroads (Map: Michigan, E 5). It has large chemical factories, cement-block works, and a tile factory. The water works are owned by the city. Pop., 1900, 2363; 1910, 2527.

MIDLETON, ninth VISCOUNT. See BRODRICK, WILLIAM ST. JOHN FREMANTLE.

MID-LOTHIAN, mid-lō'thī-an. A county of Scotland. See EDINBURGSHIRE.

MIDNAPUR, mid'nā-pōor. The capital of a district of Bardwan, Bengal, British India, on the Kasai River, 68 miles by rail west of Calcutta, with which it is also connected by a canal (Map: India, F 4). It is an educational centre, with a municipal arts college, high school, public library, central jail, and printing establishments, and is also the seat of an active American missionary settlement. It has manufactures of cloth, baskets, mats, oil, copper, brass, silk, indigo, and timber, and an important trade in rice. Pop., 1901, 33,140; 1911, 32,740.

MIDNIGHT APPOINTMENTS. In American history, a term applied to the court officials appointed under the Act of February, 1801, by John Adams on the last night of his administration as President. The commissions were signed but left undelivered in the executive offices.

MID'RASH (Heb., from *dārash*, to seek, search). The general name given to the exposition of the Old Testament among the Jews. The prohibitions and ordinances contained in the Pentateuchal codes were specified and particularized according to certain hermeneutical rules, and further surrounded by traditional ordinances and inhibitions. This division of Midrash is represented by the Halacha (q.v.),

the binding authoritative, civil, and religious law as laid down in the Talmud. Another branch of the Midrash, however, is the Haggada (q.v.), a kind of free poetical homiletics on the whole body of the Old Testament, and the term Midrash without further specification generally refers to this branch of rabbinical literature. The chief collections of this part of the Midrash are *Midrash Rabba* or *Midrash ha-gadol* (on the Pentateuch and the five scrolls) and *Pesikta* to various sections of the Bible. Besides this there are Midrashim to the separate books of the Pentateuch, Exodus, Leviticus, Numbers, and Deuteronomy.

Fiebig, *Jüdische Wundergeschichten in des neutestamentlichen Zeitalters* (ib., 1911).

MID'RIFE. The diaphragm (q.v.).

MIDSHIPMAN. In the United States and British navies *midshipman* is the lowest grade of line or executive officers. The title originated in the British navy more than 200 years ago and was derived from the fact that the "young gentlemen" on British men-of-war who were under instruction for the purpose of becoming officers were given quarters *amidships* abreast the mainmast on the lower deck. When the navy of the American Colonies was organized, the practice of the British service was followed as regards this and other ranks. Previous to the Civil War, midshipmen who had finished their course of instruction were called *passed midshipmen* until promoted. A few years after the war the title of midshipman at the Naval Academy, and on probation at sea for two years afterward, was changed to *cadet midshipman*. In 1882 it was changed to *naval cadet*, but in 1902 the title of midshipman was restored. For many years midshipmen served two years at sea after graduation, but now they are commissioned as ensigns as soon as they leave the Academy. See CADET; NAVAL ACADEMY.

MIDSHIPMAN. See SAPO.

MIDSHIPMAN EASY, MR. A story by Frederick Marryat (1836).

MIDSHIPMAN'S BUTTER. See AVOCADO.

MIDSHIPMAN'S HITCH. See KNOTTING AND SPLICING.

MIDSUMMER EVE. See SAINT JOHN'S EVE.

MIDSUMMER NIGHT'S DREAM, A. A comedy by Shakespeare, written about 1595, printed in 1600, when two editions appeared, by Thomas Fisher and by James Roberts, the latter being used for the folio reprint. It is evidently a masque or festival play and is a jumble of classic, mediæval, and fairy lore. The parts of Theseus and Hippolyta may have been taken from Chaucer's "Knight's Tale," but more probably from North's translations of Plutarch's "Theseus" (1579). Pyramus and Thisbe, drawn from Ovid's *Metamorphoses*, may have come

through Chaucer's *Legend of Good Women*, or was based on Robinson's *Handfull of Pleasant Delights*. Oberon, originating in the French *Huon of Bordeaux* in the Charlemagne cycle, is found in Greene's *James IV* (1590). Titania, without the name, can be traced to Chaucer's "Wife of Bath's Tale." Puck is the Robin Good-fellow of old English folklore. The rest of the fairy scenery is Shakespeare's own, except for a slight debt to John Lyly.

MIDWAY ISLAND. An atoll in lat. 28° 14' N. and long. 177° 23' W. discovered July 5, 1859, by Capt. N. C. Brooks of the *Gambia* and proclaimed American under the name Brooks Islands, formally annexed and named Midway in September, 1867, by the U. S. S. *Laakawanna*, at which time the Pacific Mail Steamship Company planned a coaling station. Since 1903 it has been continuously occupied as a relay station of the Commercial Pacific cable between Honolulu (1254 miles) and Guam (2593 miles). The atoll is pear-shaped, 2½ miles in its longer dimension, and has two inlets available for small vessels. Its coral wall carries two sandy islets, Middle Brooks or Eastern Island, 15 feet high and 1 mile long, and Lower Brooks or Sand Island, 55 feet high and 1½ miles long. The cable superintendent is a game warden of the Pacific bird reservation. The atoll has been the scene of many wrecks, the most important being the stranding of the mail steamer *Mongolia* Sept. 15, 1906, without loss of life or property. The cable company now maintains a light. Consult "Correspondence Relative to Legislation for Relief of Midway Islands," in 58th Congress, Third Session, *Senate Document 183* (Washington, 1905); and Churchill, "Midway Island" in the *Sun* (New York, March 10, 1912).

MIDWIFE and MIDWIFERY. See OBSTETRICS.

MIDWIFE FROG, or OBSTETRICAL TOAD. A smooth toadlike terrestrial frog (*Alytes obstetricans*) of the family Discoglossidae, found along the Mediterranean coast, and numerous and ubiquitous. From March to August the double call-note of the male, sounding like a

MIDWIFE FROG.

small bell, is heard, but it is difficult to see the performer. The remarkable feature of this frog's life, however, is its egg nurture. When the female is ready to extrude her eggs, which are of large size and attached to one another, in two rosary-like strings, to the number of several dozen, the accepted male mounts upon her back. During the expulsion of the eggs

they are fecundated by the male, who then pushes his hind limbs through the tangled mass, after which he releases the female, and retires to his hole dragging with him the burden, wrapped about his legs. He comes out each night to feed and to moisten the eggs in the dew or the nearest puddle, and after about three weeks, when the eggs are nearly ready to hatch, he takes them into the water, where he remains until the tadpoles escape through the softened envelopes. Broods born in early summer mature the same autumn, but later broods remain as tadpoles until the following May. A second species (*Alytes cisternasi*), of similar habits, occurs in Central Spain and Portugal.

MIELATZ, mē'lāts, CHARLES FREDERICK WILLIAM (1860–). One of the foremost American etchers and lithographers. He was born in Breddin, Germany, and came as a boy to the United States. He studied drawing in the Chicago School of Design, and painting under F. Rondel in New York. As a teacher of etching in the National Academy of Design, of which he became an associate member, he exercised a powerful influence upon the younger generation, and for a long time was secretary of the New York Etching Club. Although a master of many techniques, adopting or combining those best suited to the subjects represented, he never parades his craftsmanship. Much of his later work was done in color. His art is virile, his line clean cut and energetic, his presentation fresh and original. He is chiefly known as an etcher of picturesque and interesting views of New York City; such as "The Naval Arch"; "Coenties Slip," a color print; "Entrance to Brooklyn Bridge"; the "Battery"; "In the Bowery"; "New York from Brooklyn Bridge"; "Poe Cottage, Fordham," a large and imposing print; "A Pell Street Balcony," a soft ground etching in color; "High Bridge," a lithograph. For the Society of Iconophiles he designed three important series of lithographs representing views in New York City, one of them after quaint old subjects in Staffordshire ware, printed in blue ink. Among his other works are "The Wave," an aquatint in green and yellow; "Winter Night," an aquatint; "Flowers," a dry point; and "The Passing Storm." His latest important works include a series of etchings of Georgian Court, Lakewood, N. J.

MIER, myār. A Mexican town, situated on the Rio Grande, 110 miles in a straight line from its mouth (Map: Mexico, J 4). It is noted in connection with an attempted invasion of Mexico by Texans in 1842. Pop., 4000.

MIERES, myā'rās. A mining town of north Spain in the Province of Oviedo. It is situated 9 miles southeast of the city of Oviedo, among forest-covered mountains, and is surrounded by gardens and orchards. It has a score of mines and extensive factories for iron and chemical products. In the neighborhood are important mines of coal, iron, and cinnabar. Pop., 1900, 17,867; 1910, 27,866.

MIEREVELT, mē're-vēlt, MICHEL JANSZON VAN (1567–1641). A Dutch portrait painter. He was born at Delft, and studied under Willem Willemz and A. van Montfoort, called Blocklandt. Mierevelt was the court painter of the house of Orange, and attained celebrity. His portraits are simply and correctly painted and well characterized, but are somewhat cold and hard. Many inferior copies by pupils are also signed by his name. Among his best-known

works are William the Silent and other princes of Orange-Nassau, in the Rijks-Museum, Amsterdam; the poet Jacob Cats (ib.); and Oldenbarneveldt (Louvre). He is also represented by portraits in the galleries at The Hague, Dresden, London, Berlin, and in the Metropolitan Museum, New York. In the hospital at Delft is the "Anatomy Lesson," designed by him and executed by his son and pupil Pieter (1596-1623).

MIERIS, mē'ris. A family of Dutch painters. **FRANS VAN MIERIS**, the elder (1635-81), a genre painter, was born in Leyden, and was a pupil of Torenvliet, of Gerard Dou, and of Adriaen van den Tempel. His pictures are characterized by elegance of line; the color is clear, delicate, and rich, especially in painting velvets, satin, and other rich stuffs. The treatment is too superficial and smooth, however, to be strong. His principal works include the "Lady in the Crimson Jacket," National Gallery, London; "Lady at her Toilet," "Two Ladies Drinking Tea," "Interior of a Household," and a "Male Portrait," in the Louvre; "Boy Blowing Soap-Bubbles" and "The Artist and his Wife" (1663), in The Hague Museum; "Lady Writing a Letter" (1680) and "Lady Playing the Lute," Amsterdam Museum; the "Smoker" (1662) and a "Woman Fainting," Munich Gallery; the "Tinker" and many others in the Dresden Gallery.—**JAN VAN MIERIS** (1660-90), a genre and portrait painter, son and pupil of Frans the elder; he studied also under Lairese. Examples of his work are an "Assembly of Ladies and Gentlemen with a Lute-Player," Gotha Museum; "Surgeon Dressing a Wound," Hermitage, St. Petersburg.—**WILLEM VAN MIERIS** (1662-1747), a genre and mythological painter and sculptor, was born in Leyden, the son and pupil of Frans the elder. His work represents the school in its decline, and is inferior to his father's in drawing and impasto. He also modeled statuettes and vases adorned with bas-reliefs. Among his works are the "Trumpeter," the "Poultry Dealer," and the "Merry Topper," all in the Dresden Gallery.—**FRANS VAN MIERIS**, the younger (1689-1763). A genre painter and writer. He was the son and pupil of Willem, and a distinguished antiquary, and published works of merit on numismatics and history. His books include the *Historie der nederlandsche vorsten* (1732-35) and *Groot charterboek der graven van Holland, van Zeeland en heren van Vriesland* (1753-56). Among his paintings, which are of an inferior order, are the "Pharmacy" (1714), Amsterdam Museum; portrait of his father (1737), Copenhagen Gallery; and the "Fishmonger" (1747), Rotterdam Museum.

MIEROSLAWSKI, myě'rō-slāf'skē, LUDWIK (1814-78). A Polish revolutionary leader, born at Nemours, France. He was the son of a Polish officer in the service of France, received his education at the military school in Kalisz, and joined the Polish insurgents in 1830. Mieroslawski distinguished himself greatly, and was made an officer, serving until the fall of Warsaw, when he settled in Paris. Here he published a number of books in Polish and French, the most significant of which are: *Histoire de la révolution de Pologne* (vols. i-iii, Paris, 1837; iv-v, 1878); *The Revolution in Posen* (in Polish, ib., 1853). In 1846 he was at the head of another revolutionary movement in Poland, which resulted in his being captured and sentenced to death. From this fate he was rescued by the

outbreak of the general revolutionary movement of 1848. After fighting in Posen, Mieroslawski resigned his command in the face of ultimate defeat. In 1849 he participated in the revolutionary movement in Sicily, and after resigning his command placed himself at the head of the revolutionary army in Baden, but eventually retired to Paris. His last appearance as a revolutionist was in Poland in 1863, and, after the failure of that attempt, he spent the last years of his life writing political pamphlets. He died in Paris, Nov. 23, 1878.

MIFFLIN, FORT. See FORT MIFFLIN.

MIFFLIN, GEORGE HARRISON (1845-1921). An American publisher, member of the firm of Houghton, Mifflin & Company. Born in Boston, and educated at Harvard, he became connected with the publishing house of Hurd and Houghton (1867) and with the Riverside Press; he was admitted to the firm in 1872, and continued a partner in the succeeding firms of Houghton, Osgood & Company (1878-1880) and Houghton, Mifflin & Company (1880-1908). After 1908 he was president of the last-named company. He became president also of the Riverside Press, Cambridge, Mass.

MIFFLIN, LLOYD (1846-1921). An American poet, born at Columbia, Pa. He studied painting under his father, J. Houston Mifflin, a portrait painter and writer of verse, under Thomas Moran (1868-69), and later in Italy and Germany (1870-72). His work was exhibited in the United States, but failing health having forced him to abandon painting he turned to the writing of poetry. Among his numerous volumes of verse are: *At the Gates of Song* (1897); *The Slopes of Helicon, and Other Poems* (1898); *Echoes of Greek Idyls* (1899); *The Fields of Dawn and Later Sonnets* (1900); *Castalian Days* (1903); *The Fleeing Nymph and Other Verse* (1905); *Collected Sonnets* (1905); *Toward the Uplands* (1908); *Flower and Thorn* (1909).

MIFFLIN, THOMAS (1744-1800). An American soldier and statesman. He was born at Philadelphia, of Quaker parentage. He graduated at Philadelphia College in 1760, was a member of the Pennsylvania Legislature in 1772 and 1773, and in 1774 was sent as a delegate to the Continental Congress. Entering the army as a major in 1775, he became Washington's first aid-de-camp with the rank of colonel; was made quartermaster-general in August, 1775; and finally (Feb. 19, 1777) was promoted to the rank of major general and appointed a member of the Board of War. During the retreat from Long Island he commanded the covering party, and afterwards rendered valuable service by rousing the people to enlist, bringing essential aid to General Washington before the battles of Trenton and Princeton. Becoming dissatisfied with Washington's management of the war, he intrigued for his removal, forming with Conway and others the so-called "Conway Cabal" (q.v.), on the failure of which he was replaced (March, 1778) by Nathanael Greene as quartermaster-general, and in October, 1778, was removed from the Board of War. He was elected to Congress in 1782 and became its President the following year. He was a member and Speaker of the Pennsylvania State Legislature in 1785, and a delegate to the Constitutional Convention of 1787. From 1788 to 1790 he was President of the Executive Council of Pennsylvania, and from 1790 to 1799 was the first Governor of the State.

As such he took a conspicuous part in the suppression of the Whisky Insurrection, assuming personal command of the Pennsylvania militia. Consult: Simpson, *Eminent Philadelphians* (Philadelphia, 1859); J. H. Merrill, *Memoranda Relating to the Mifflin Family* (ib., 1890); William Rawle, "Sketch of the Life of Thomas Mifflin," in *Historical Society of Pennsylvania, Memoirs*, vol. ii (ib., 1830).

MIFFLIN, **WARNER** (1745-98). An American reformer, cousin of General Thomas Mifflin. He was born of Quaker parentage in Accomac Co., Va. While a mere boy he became impressed with the wrong of slavery, and about 1774 freed all his slaves and gave them compensation for past services. From that time forward he traveled about frequently to the various meetings of his sect, and did much to create a sentiment against slavery among his fellow Quakers. His religious principles led him to oppose the Revolutionary War, and at the request of the Yearly Meeting at Philadelphia he visited both Howe and Washington in order to point out the wickedness of the struggle. Mifflin is perhaps best remembered for having in November, 1792, presented to Congress a strong memorial against slavery which resulted in a spirited debate over the question of the right of petition. Consult Hilda Justice, *Life and Ancestry of Warner Mifflin* (Philadelphia, 1905).

MIGDOL. A place in Egypt mentioned in Ex. xiv. 2; Ezek. xxix. 10 (A. V. margin); Jer. xlv. 1 and xlv. 9. The name is identical with the Hebrew *migdal*, 'tower,' 'castle.' As an appellation it occurs in Egyptian inscriptions as early as the fourteenth century B.C. The exact location of the Migdol referred to in the story of the Exodus is uncertain. It may have been only a guardhouse on the road. A *Makthal* is spoken of in Papyrus Anastasi v. 20 as the "watchtower of Seti," but this place cannot be identified with certainty. From Ezek. xxix. 10 it is evident that a locality in the extreme north of Egypt is intended, as it is contrasted with Syene in the extreme south. In Jer. xlv. 1 it is mentioned in connection with Tahpanhes (Daphnæ) and Noph (Memphis), and in Jer. xlv. 9 as a place inhabited by exiled Jews. This may be identical with *Magdolo* in a Roman itinerary, possibly at the modern Tell el Her, 12 miles south of Pelusium.

MIGNARD, *mě'nyâr'*, **PIERRE** (1610-95). A French portrait and historical painter. He was born at Troyes, studied under Jean Boucher in Bourges and Simon Vouet in Paris, and resided for twenty-two years in Italy, where he was much influenced by the works of Annibale Carracci. At Rome he painted the portraits of Pope Alexander VII and many of the Roman nobility, and at Venice many Venetian nobles. In 1657 he was summoned by Louis XIV to Paris, where he painted the King ten times, Cardinal Mazarin, and many other celebrities. In 1664 he decorated the cupola of the church of Val-de-Grâce, Paris, where he represented a colossal Paradise, with two hundred figures, some of which are three times the size of life. This is the most ambitious fresco decoration in France, but the color has suffered much from time. He also painted decorations in the palace of Versailles. He was famous in Paris as the leader of the opposition against Le Brun and the Academy, but upon the latter's death in 1690 he fell heir to all his positions, becoming director of both the Gobelins and the Academy.

Mignard was the leading French portrait painter of the seventeenth century. His other pictures are rather cold, superficial, and conventional, but his coloring, derived from the Venetians, is good. The Louvre contains a number of his works, including the portrait of Madame de Maintenon, "The Virgin of the Grapes," "Saint Cecilia," and "Saint Luke Painting the Virgin." Others are in the galleries of Versailles, Madrid, St. Petersburg, Vienna, Berlin, London, and Florence. Consult Eugène Lebrun-Dalbance, *Etude sur Pierre Mignard, sa vie, sa famille, et son œuvre* (Paris, 1878).

MIGNE, *mě'ny'*, **JACQUES PAUL** (1800-75). A Roman Catholic editor. He was born in St. Flour, France, Oct. 25, 1800, and was educated at Orléans. In 1824 he became a priest and performed the functions of his office till 1833, when a pamphlet published by him, entitled *De la liberté, par un prêtre*, brought upon him the censure of the Bishop of Orléans, who forbade its publication. Migne went to Paris, and the same year established *L'Univers Religieux* (later called merely *L'Univers*), designed to harmonize the church with the free spirit of civil government. Later he commenced the publication of a collection of works called *Cours complets de théologie et d'écriture sainte*, and founded a publishing house on a large scale called *L'imprimerie catholique*, designed to furnish standard religious works at a low price. He established the daily *Vérité*, which in 1856 became the *Courier de Paris*. The *Cours complets* finally grew into a very long series of volumes of standard authors under the general head of *Bibliothèque universelle du clergé et des laïques instruits*. The parts which are best known are *Patrologia Latina*, in 221 volumes (Paris, 1844-64); *Patrologia Græca* (Greek and Latin) in 165 volumes (Paris, 1857-66); and *Patrologia Græca* (in a Latin version), in 85 volumes (Paris, 1856-67). They are reprints of the famous Benedictine editions and many others, and, while not perfect, bring together very conveniently well-nigh the whole library of the ecclesiastical writers to Innocent III (d. 1216). His printing establishment suffered severely from fire in 1868, from the Franco-Prussian War in 1870, and from later ecclesiastical opposition. Migne died in Paris, Oct. 25, 1875.

MIGNET, *mě'nyâ'*, **FRANÇOIS AUGUSTE MARIE** (1796-1884). A French historian. He was born May 8, 1796, at Aix, in Provence, studied law in his native city with his lifelong friend, Adolphe Thiers, and in 1822 went to Paris in order to devote himself to a literary career. He found employment in writing for the public journals, and after giving lectures on modern history, which were received with great approbation, he wrote his *Histoire de la révolution française* (1824). In 1830 Mignet and Thiers in conjunction founded the liberal journal *Le National*. After the revolution of July he became a Councillor of State, and Keeper of the Archives of the Ministry of Foreign Affairs, but he lost these offices in 1848. In 1836 he was received into the French Academy. He edited *Négociations relatives à la succession d'Espagne sous Louis XIV* (1836-42). Other of his works are: *Notices et mémoires historiques* (1843-53, 1854); *Vie de Franklin* (1848); *Histoire de Marie Stuart* (1851); *Charles Quint, son abdication, son séjour et sa mort au monastère de Yuste* (10th ed., 1882); *Eloges historiques* (5th ed., 1884);

and *Rivalité de François I et de Charles V* (1872-75); also a drama entitled *Antonio Perez et Philippe II* (1845-46). Mignet died in Paris, March 24, 1884. Consult: Trefort, *Mignet und seine Werke* (Budapest, 1885); Simon, *Mignet, Michelet, Henri Martin* (Paris, 1889); Edouard Pet, *François Mignet* (ib., 1889); G. P. Gooch, "The Growth of Historical Science," in *Cambridge Modern History*, vol. xii (New York, 1910).

MIGNON, mē'nyōn' (Fr., darling). 1. An Italian girl in love with Wilhelm, in Goethe's *Wilhelm Meisters Lehrjahre* (q.v.). 2. A derisive name applied to the effeminate favorites of Henry III of France. 3. An opera by Ambroise Thomas (q.v.), first produced in Paris, Nov. 17, 1866; in the United States, Nov. 22, 1871 (New York).

MIGNON, mīn'yōng', ABRAHAM (c.1640-79). A German painter, born in Frankfort-on-the-Main. He studied under Jacob Marrel, who took him to Haarlem, where he became the pupil of Jan David de Heem, the celebrated fruit and flower painter. He selected subjects similar to those his master painted, but never equaled him. His composition is more formal, his color less agreeable, and there is too much detail, although his better works are rich, warm, and harmonious. Among his more notable works are a study of flowers, fruit, and other objects, and some "Flowers in a Vase," in the Amsterdam Museum. The Van der Hoop collection in Amsterdam also has a dish with fruit, oysters, and bread, that is more broadly painted than is usual with him. Of his six pictures in the Louvre, two are very fine—a "Bouquet of Wild Flowers" and "Flowers and Fruit." He is also well represented by similar pieces in Dresden, Munich, Brussels, The Hague, Vienna, and other European cities.

MIGNONETTE, mīn'yūn-ēt' (Fr. *mignonette*, dim. of OF., Fr. *mignon*, favorite, dainty, from OHG. *minna*, Ger. *Minne*, love, Icel. *minna*, recollection; connected with Goth. *gamunan*, AS. *munan*, Icel. *muna*, to be mindful, Lat. *mens*, Gk. *mēnos*, *menos*, mind, Skt. *man*, to think), *Reseda odorata*. An annual or perennial plant of the family Resedaceæ, a native of the north of Africa, widely cultivated in gardens during summer and in greenhouses and windows during winter for its fragrant flowers. It has lanceolate entire or trifid leaves, and erect terminal racemes of small yellowish-white flowers, which have a six-parted calyx as long as the corolla, and three-toothed capsules. What is called tree mignonette is not even a distinct variety, but merely the common kind trained in an erect form, and prevented from early flowering by pinching off the ends of the shoots. White or upright mignonette (*Reseda alba*), a native of southern Europe, another very popular species, which grows from two to three feet high and bears its white flowers with brownish anthers in dense erect spikes, makes a fine border plant and grows well on ordinary garden soils. The seeds are sown in the open in April or May and later on the plants are thinned to a foot or 18 inches apart. Dyer's weed, or weld (*Reseda luteola*), is a tall species with long spikes of yellowish flowers. All species are generally propagated from seeds, but cuttings are sometimes used.

MIGRAINE, mī-grān' (OF., Fr. *migraine*, from Lat. *hemicranion*, from Gk. *ἡμικρανία*, *hēmikrania*, pain in one side of the head, from *ἡμι*, *hēmi*, half + *κρανίον*, *kranion*, head), MEGRIM, HEMICRANIA, SICK HEADACHE. A paroxysmal

affection characterized by severe headache, usually one-sided and often associated with disorders of vision. The pain is more frequently left-sided, but the right half or the whole head may be affected. There is an hereditary element in many cases and the disease is apt to become established before the age of 30. Hemicrania has been recognized as a peculiar affection and attempts to explain its origin have continued from the earliest times to the present day. Aretæus and Galen associate it with diseases of the stomach and bile passages, and medical writers generally accepted this explanation up to the end of the Byzantine period. Tissot (in 1784) is credited with the first satisfactory description of the disease. He points out its hereditary character, the fact that the pain may be bilateral, and describes the associated phenomena. Tissot's description remained authoritative until 1873, when Liveing's monograph *On Megrin, Sick Headache, and Some Allied Disorders* appeared, although Vater, Heberden, Schönlein, Romberg, Du Bois Reymond, Claude Bernard, and many other distinguished investigators had also made observations upon the eye symptoms and nervous phenomena. At the present time several theories as to the etiology are put forward, all of which have a reasonable basis. These may be merely mentioned as follows: 1. The toxic hypothesis, which assumes that the irritation is due to poisons formed within the body, giving rise to irritation in the cranial nerves. These poisons have been variously assumed to be uric acid, xanthin, paraxanthin, etc. 2. The vasomotor theory assumes that the essential feature is a vasomotor spasm, followed by dilatation, causing anæmia and hyperæmia alternately, which acts on the nervous tissues and causes the headache. These two theories do not necessarily conflict. 3. The reflex hypothesis implicates the sensory nerves in different parts of the body, such as those supplying the eyes, ears, nose, throat, ovaries, and intestines. 4. Recently (1907) Spitzer advanced the theory that migraine is due to an hereditary or acquired anatomical defect resulting in complete or partial stenosis of the foramen of Monro. Whatever causes a passive or active hyperæmia of the brain in such individuals leads to hyperæmia of the choroid plexus with increased secretion of cerebro-spinal fluid and a more or less complete plugging of the foramen of Monro, followed by a rise of intracranial pressure due to distention of the lateral ventricle. The final result of this is an increase in intracranial tension with pressure on the branches of the fifth nerve supplying the dura mater. From all these theories a fairly correct understanding of the phenomena of migraine may be formed. The essential feature is increased intracranial pressure due to vasomotor changes. These may be brought about either by toxic, mechanical, or reflex influences. Women are the chief sufferers. Migraine is associated with gout, rheumatism, decayed teeth, eye strain, and uterine disorders. It is often due to reflex causes, such as powerful emotions, mental or bodily fatigue, disorders of digestion, and the like. The attacks may be unheralded, but generally there are premonitory symptoms of a widely different character in different individuals. Among these may be mentioned a sense of heaviness, with yawning, chilliness, dizziness, or depression, spasmodic closure of the eyelids, twitching, and various sensory disturbances,

ringing in the ears, irregularity in the taste and smell, and diminution of the saliva. These symptoms may be felt several minutes before the attack or may precede it by hours or several days. The speech may be disturbed, the phenomena being those of sensory aphasia. This, according to Charcot, is an intermittent aphasia, in which the patient can recall the right word at one moment but is unable to do so at the next. In some patients there is a transient loss of memory. Charcot attributes these disturbances to a vasomotor spasm near the speech centre. The headache may originate in the temple, forehead, eyeball, or occiput, whence it spreads gradually over one side of the head, sometimes extending to the neck or even to the arm. The face may be pale or congested and the eyes red; nausea or vomiting appears very early in the attack. Few affections are more prostrating than migraine. The attack endures for a variable time; the sufferer may be incapacitated for a few hours only or for a period of two or three days.

Treatment depends in large part upon the etiology, and is generally satisfactory. Exercise in the open air, moderate diet, hydrotherapy, and other measures tending to stabilize the blood pressure are demanded in most cases. Careful search is made for reflex factors in every part of the body, particularly those parts which are supplied by the fifth cranial nerve, since it is in branches of this nerve that the pain is localized. Ocular troubles, such as refractive errors and muscular imbalance, must be corrected. Points of pressure in the nose must be relieved and active or latent disease of the accessory nasal sinuses cured. The teeth must be thoroughly investigated and search made for cavities, diseased foci, or unerupted molars. An X-ray photograph will often reveal a diseased condition in the teeth or nasal cavities which may otherwise be unsuspected. In rare instances excessive auditory stimulation may bring on an attack. The persistent search for and correction of the above-mentioned peripheral or reflex factors has done far more to cure migraine than any other system of treatment devised. The medicinal treatment is merely symptomatic. The vast number of drugs which are mentioned in this connection attest the inefficiency of this plan of treatment. Among the pain relievers are antipyrine, cannabis indica, and chloroform; nitroglycerin and ergot are used to equalize the circulation, and iron, arsenic, nux vomica, etc., may be given as tonics. Electricity and massage are often helpful. During the paroxysm the sufferer should remain quiet in bed and in a dark room. There is an extensive literature in connection with the subject, most of it German. Consult: Edward Living, *On Megrism, Sick Headache, and Some Allied Disorders* (London, 1873); Alexander Spitzer, *Ueber Migräne* (Jena, 1901); George Flatau, *Die Migräne* (Berlin, 1912); Auerbach, *Headache*, translated by Playfair (London, 1913). See HEADACHE.

MIGRATION (Lat. *migratio*, from *migrare*, to migrate). The movement of peoples from one place to another, usually, though not necessarily, for the purpose of settlement. Movements of population were no doubt common in prehistoric times, and in the historic period there have been notable migrations that have affected the history of civilization. Students of African ethnology have traced migrations among the

negro tribes of that continent that are of importance to the ethnographer; and a more complete knowledge of the ethnology and prehistoric archaeology of America will probably make it possible to trace such movements among the American tribes, and perhaps will throw some light upon their origin. Migration has played a large part in theories for the explanation of cultural transmission, but W. H. R. Rivers has recently suggested that cultural traits may be diffused by relatively small groups of wandering immigrants, provided their culture succeeds in profoundly impressing the people with whom they come into contact.

Aryan. The accepted hypothesis until recently was that the so-called Aryan or Indo-European family—embracing the Celtic, Teutonic, Greek, Latin, Balto-Slavonic, Armenian, and Indo-Iranian peoples—originated in the Pamirian region of Central Asia, whence the last-named group moved into India and the Iranian Plateau, while the remaining groups migrated westward, the Celtic peoples leading the way and advancing to central Europe, the Teutons settling about the Baltic, the Greeks and Latins finding their way to the Mediterranean, the Balto-Slavonic to the Baltic Provinces, Lithuania, and the region of steppes and rivers to the southeast, while the Armenians settled near the Caspian Sea. Later investigation of the remains of primitive man in Europe, together with a comparative study of the Aryan tongues, has cast grave doubt upon this theory, and made it seem probable that there never was an undivided Aryan family, unless the term be restricted to the peoples of northern India and Persia, and that the European Aryan groups originated near their present habitats; that the Baltic was the original centre of diffusion of European races, and that the Græco-Latins migrated southward to the Mediterranean and the Indo-Iranians and Armenians southeast into Asia. Another hypothesis locates the original Aryan home in the steppes of southeastern Europe. (See ARYAN; INDO-GERMANIC LANGUAGES.) In prehistoric times the Celtic peoples spread over much of Europe and even into Asia Minor in great migrations. From them the Teutonic tribes acquired much of their civilization. See CELTIC PEOPLES.

German. The migrations of whole Teutonic tribes, during the years of decline of the Roman Empire, had a profound influence upon the social and political development of Europe, and are known preëminently as the migrations (*Völkerwanderung*). These peoples had been on migrations, intermittently, for centuries before the time when Tacitus wrote his *Germania*. In the centuries following the period when he gave his account of them they were engaged in intertribal strife, which resulted in the loss of identity of the weaker tribes, the remnants of which were merged in the new confederacies—Goths, Vandals, Alemanni, Franks, and Burgundians (q.v.). In the fourth century A.D. the Goths were spread over the country north of the Danube. There came upon them from Asia a great migratory wave of the nomadic Huns (q.v.), a Mongolian people. The Goths (q.v.) were unable to resist this inroad, the Ostrogoths were enslaved by the Huns, but the Visigoths obtained permission from the Roman Emperor to cross the Danube into Roman territory. Because of ill treatment by the Romans they revolted and in the battle of Adrianople (378 A.D.)

annihilated a Roman army and killed the Emperor. But they made peace with the new Emperor, Theodosius, and until his death, in 395 A.D., remained quiet. Then they started on their great migration under Alaric (q.v.), which resulted in the establishment of the Visigothic kingdom in southern Gaul and Spain. This march of the Visigoths was the beginning of "the migrations," and it was soon followed by movements of other Germanic tribes. The Vandals (q.v.), who in the fourth century were settled between the Danube and the Theiss, in 401 A.D. started on their long migration which traversed part of Gaul and Spain and finally led to the establishment of their kingdom in north Africa. The Burgundians (q.v.), who at an early date had migrated from their home between the rivers Oder and Vistula, invaded Gaul early in the fifth century and established a kingdom on the Rhine. After defeats by both the Romans and the Huns the small remnant settled in what is now Savoy. The Ostrogoths (see GOTHs), who were living north of the Black Sea, escaped from servitude to the Huns about the middle of the fifth century. Under Theodoric the Great (q.v.) they invaded Italy, nominally as soldiers of the Emperor, and established there the Ostrogothic kingdom, in 493, after the murder of Odoacer (q.v.). The last great German migration into Italy was made by the Lombards. At the beginning of the Christian era their home was on the left bank of the lower Elbe. Little is known of their wanderings until they reached the Danube about 487 A.D. In 568, under the leadership of Alboin (q.v.), they and their allies, including 20,000 Saxons, crossed the Alps and soon conquered northern Italy, Lombardy. Under "the dukes" they spread over almost the whole of Italy. In the meantime the Franks (q.v.) had gradually extended their conquests and migrations southward. Under Clovis (q.v.) they obtained possession of almost all Gaul. The Angles, Saxons, and Jutes (qq.v.), probably from Schleswig and the neighboring lands, invaded Britain from about 449 to 549 A.D.

The above were the most important of the German migrations. The numbers involved in them were considerable, but not so great as was formerly supposed; no accurate estimate can be given. These migrations show the depopulation of some portions of the Roman Empire, as whole tribes of barbarians found homes without exterminating or driving out the inhabitants. They also show the weakness of the Empire, which was powerless to check these bands encumbered by their women and children and all their property. In the sixth century Justinian (q.v.) reconquered Africa from the Vandals and Italy from the Ostrogoths; the Franks conquered the Burgundians and the Visigoths in Gaul. In the eighth century the Mohammedans conquered the Visigoths in Spain and the Franks subdued most of the Lombards in Italy.

Asiatic. The migrations of the Asiatic peoples are very different from the Teutonic, because they did not carry their households with them. From time immemorial the weaker tribes in the steppes of Central Asia have been driven out from their pastures and robbed of their wives by the stronger, and consequently have been compelled to seek homes elsewhere. While weaker than their conquerors they have been almost invincible to the settled peoples, whose lands they harried by sudden invasions on horse-

back. When they found a competent leader they made widely extended conquests, enslaving the people and taking their women from them. On the death of the leader the unification frequently ceased and the tribe lost its power. Of this character were all the great invasions of Europe by the nomads, Scythians, Sarmatians, Huns, Bulgars, Avars, Magyars (qq.v.), and Cumans. Of these invasions that of the Huns, in the fourth century, was probably the most influential for European history, as it forced into feverish activity the German migrations. Under Attila (q.v.), in the first half of the fifth century, the Huns built up a strong power in central Europe, but this went to pieces after Attila's death. In the later Middle Ages the movements begun by Genghis Khan (q.v.) had a great effect upon all eastern Europe. Consult: Bryce, "Migrations of the Races of Men Considered Historically," in *Smithsonian Institution, Annual Report, 1893* (Washington, 1894); E. A. Freeman, *Western Europe in the Fifth Century* (New York, 1904); J. A. G. von Pflugk-Harttung, *Great Migrations* (Philadelphia, 1905); A. C. Haddon, *The Wanderings of Peoples* (Cambridge, 1912). See MONGOL DYNASTIES; TIMUR; TURKEY, section *Ethnology*.

The migrations in modern times have been on a larger scale than in the past, and are discussed in the article upon EMIGRATION. For the effects of the Germanic migrations, see EUROPE, section on *History*. For bibliography, see the articles on the various nations and tribes mentioned.

MIGRATION, WAGNER'S LAW OF. In evolution, one of the main agencies leading to the isolation of animals, and consequently to the formation of local races, varieties, and species. This was first pointed out by Moritz Wagner in 1868. He stated his views in three general propositions: (1) the greater the change in the conditions to which individuals are subjected on emigrating to another territory, the more intense must be the inherent individual variability of each organism; (2) the less the even tenor of this increased individual variability of organisms is interrupted by frequent crosses with emigrants of the old stock, the more frequently will nature be successful in forming a new variety or incipient species by the accumulation and inheritance of fresh characteristics; (3) the more advantageous to the variety the change in each single organ, the better it will be able to adapt itself to surrounding circumstances; and the longer the selection of an incipient variety of colonists remains undisturbed by the old stock, the more frequently will a new species arise out of the variety. These laws are fully illustrated by Wagner in his works, and by later observers. Wagner claimed that evolution by natural selection is impossible unless it be assisted by geographical isolation in order to prevent the swamping effects of intercrossing. The numerous facts observed by Wagner and others show that some of the barriers isolating incipient species are broad rapid rivers, oceans, and mountains. He speaks of the extraordinary phenomena of so many species of plants and animals peculiar to the volcanoes and isolated mountains of Quito. "Without the distribution of organisms by migration in connection with local selection it would be inexplicable. The gigantic isolated mountains of this highland act a similar part in the formation of varieties and species as the islands of the archipelago, for instance, of the Galapagos." Wagner also

claimed that adaptation to changed conditions of life and transformation appear to be tantamount to a renovation. Species, he said, which did not migrate, and consequently did not alter in form, became extinct. Consult Moritz Wagner, *The Darwinian Theory and the Law of the Migration of Organisms* (Munich, 1868; trans. by Laird, London, 1873).

MIGRATION OF ANIMALS. The word migration is used in two senses: either to refer to those periodical changes of location such as are made by many species of birds and fishes, by some mammals, and by a few insects, or to those irregular dispersions caused by overcrowding and lack of food or water.

Mammals. Among mammals migrations in the first sense are mainly confined to certain Cetacea, which regularly move from and to the polar seas with the alternating seasons. Regular seasonal movements, truly migratory but short, are practiced by many land animals, especially the herbivores. All deer, goats, sheep, antelopes, and the like, which dwell in mountainous regions, regularly ascend the heights in early summer to get the new grass, find safer solitudes, escape the lowland flies, and otherwise better themselves. In the fall they come down as the snow and cold increase upon the heights, and seek the valleys or the neighboring plains. The American bison formerly was wont to retreat from the mountains to the plains during severe winters, while those on the northerly plains tended to move south. Before the time of railroads the great body of the pronghorns of the plains used to migrate from the northern area of their range to the milder regions south of the Platte River, and returned north in the spring. Still more striking is the regular and prolonged annual migration of the caribou from the Arctic shores of America to the southerly interior, especially in the region north and east of Hudson Bay; they cannot live so far north during the winter, but go back as soon as the snow melts in spring. In all these cases there is an accompanying migration of certain large predacious animals, such as wolves, which depend upon the grazers for food. Similar facts may be cited from the plain regions of Asia, Australia, Patagonia, the Sahara, and South Africa, where seasonal changes, either of cold or drought or the parching of pasture, compel annual migrations to and from other regions not far distant. It will be seen that these movements are under compulsion of the lack of food (or frequently in desert regions of water), and are continued only when and so far as necessary. Mammals are too slow and hampered in their movements on land to make long, rapid journeys, such as a bird or fish is able to accomplish through the unobstructed air or water; and most mammals either can find food all the year round, or have acquired the power, by storage of provisions or by sinking into dormancy, of tiding over the seasons of scarcity.

Overflows of Mammalian Life. Mammals, including man, take part in certain much more rare but more universal and permanent removals. The most conspicuous instance is afforded by the lemmings of central Norway and Sweden, which at uncertain intervals come down in vast hordes into the lowlands, as is fully described under LEMMING. They travel by night, feed and multiply excessively, and in from one to three years the few which escape the hordes of enemies following them reach the Atlantic or the Gulf

of Bothnia. It is believed that these sudden incursions are the dispersal of an overpopulation in the ordinary habitat of the species, due to a combination of favoring circumstances causing an increase of a naturally fecund race until the country cannot longer support the numbers. The animals are started abroad by famine, and continue the flight in aimless restlessness until an equilibrium is restored. The same thing happens occasionally with various other small rodents. "Plagues" of mice have broken out frequently in the grain-growing regions of southern Russia and in other parts of the world. In the western part of the United States, until hunting kept down the stock, there used to be irregular but prodigious movements of squirrels (normally extremely numerous there), which would appear in droves over a wide range of country, all traveling steadily in one direction, until they gradually vanished. The writings of Audubon, Godman, and other early naturalists contain many records of these movements, which did not cease until about 1840. The theoretic and historic incursions of human hosts from Asia into Europe, the spread of the Bantu races which overran Africa, and similar "waves" or "migrations" of conquering men, fall into the same category, but their superior adaptability has enabled them, or some of them, to remain and possess the land.

Insects. The insects afford many cases of mass movements similar to those of mammals, and also a rare approach to true migrations. The swarms of grasshoppers, or locusts, which occasionally visit parts of Africa and Asia, are one of the most familiar phenomena of those regions; and they are accompanied by a rapacious following of birds and mammals feeding upon the traveling hosts of insects, which disperse, dwindle, and finally disappear. In the United States the most disastrous excursions of these insects have been from the Rocky Mountains eastward. They are of irregular occurrence, and the returning swarm the succeeding year is composed only of the descendants of the original emigrants—a fact which contains a hint as to the possible origin of the true migratory habit in others. Irregular movements without, so far as we know, any attempt to return to the original home are illustrated by the army worm, chinch bug (qq.v.), and cotton worm. (See COTTON INSECTS.) These migrations are due to overcrowding and lack of food. There are still slower migrations among insects, which may be termed "spreading." Thus the Colorado potato beetle, a native of the Rocky Mountain plateau, spread eastward, when suitable food was offered it by the cultivation of potatoes, until it now occurs all over the potato region of eastern North America, and, like the brown rat, it permanently occupies all the new territory it enters. A few insects (butterflies) are known to migrate in the sense that fish and birds do.

Reptiles and Fishes. Such phenomena are entirely unknown among reptiles, for obvious reasons, with the possible exception of seagoing turtles, which may withdraw into deeper water or more southerly latitudes in winter than in summer. Many fishes perform long and complex wanderings, but how they are guided in some cases across and up and down the ocean will be a very difficult problem to solve. Salmon and other anadromes come from the sea each spring and ascend hundreds of miles up rivers so as to spawn in places suited to the needs of

the young. The fish so bred return to spawn in the water of their birth, as has been demonstrated by marking smelt that have been transplanted and hatched in rivers previously unoccupied by them; the marked smelt returned from the sea to spawn in the river of their adoption. Experiments upon herring along the Massachusetts coast confirm this conclusion. Sea fishes generally retire to comparatively deep water, and probably many species go southward in winter, while in summer they spread northward and approach the shores, river mouths, or other spawning places. These migrations are induced by reproductive desires and necessities, and the slight variation in the time of the coming of each species, which fishermen expect with fair regularity, seems due to variations in the temperature of the water. It is probable that even these ocean wanderers return to the same part of the coast where they were bred, and that in some cases, as of the Atlantic salmon, exaggerated notions have prevailed as to the distance to which they go in winter. See SALMON.

The Migration of Birds. More conspicuous and interesting, and quite as difficult to explain, are the migrations of the birds, which have been the theme of poetry, homily, and fable, as well as a baffling subject of inquiry, ever since men began to notice the ways of animals.

Most persons have a vague idea that the habit of yearly migration among birds is uniform and universal, but this is not so. Most birds do not migrate at all, and among those that do great diversity exists, so great that the custom seems almost an individual rather than a racial one. The whole body of ratite birds—ostriches, rheas, cassowaries, and the like—are nonmigratory. The fish-eating sea fowl make no more of an annual migration than is necessary to escape from the ice and darkness of their most polar haunts to where there may be open sea. These are wanderers rather than migrants. Gulls and terns, geese, ducks, and the wading marsh and beach birds are in the main migratory, and include some of the most remarkable examples. Of the game birds fewer are real migrants, but here again a few notable exceptions exist, of which one of the most familiar is that of the common European quail, which has been taken so numerous for centuries on both sides of the Mediterranean, and whose migratory flocks still feed travelers wandering in the wilderness of Sinai. The pigeon tribe is sedentary as a rule, also, yet one of its species—the passenger pigeon of North America—has become the very type and exemplar of a migratory bird. Many, but not all, birds of prey regularly migrate, but it is a question whether they do not, in most cases, accompany the movements of the smaller birds rather than travel of their own impulse. Parrots are almost wholly nonmigratory. It is not, then, until we have passed 21 of the 23 classified orders of birds (with the exceptions above noted) that we come to those groups, the picarian and passerine birds, in which the custom of seasonal migration is a prominent characteristic. These are, to be sure, the most numerous as well as the most highly organized orders; yet a large number even here do not migrate at all from temperate regions, but form a resident or partially migrant population in all moderate latitudes, where they remain all the year round. On the whole, the large majority of the total list of the birds of the world are not migratory to any considerable degree.

When we examine the minority which does annually alternate between southerly winter and northerly summer residences many curious facts are discernible. First, it is noticeable that all migratory birds belong to the colder latitudes of the globe; and, on the other hand, that those groups which are wholly nonmigratory represent the primitive types—birds whose ancestry goes back to times when a comparatively warm climate prevailed over the now unbearably cold and sterile polar regions. In general, two-thirds of the birds of the middle temperate zones, both north and south, are migrants, and the total is a very small part of the entire avifauna of the world. Taking up the character of the migratory birds as a class, it appears, first, that they are such as either subsist wholly or mainly on soft-bodied insects—larvæ, worms, and the like—or give their young such fare; second, such as gain their living from fresh or brackish waters or mud, which is likely to freeze; and third, such as follow small birds in order to prey upon them. It is also significantly true that they represent families whose mass and affiliations are found in the tropics, in many cases only one or two species being known elsewhere. Europe's single cuckoo, the eastern North American humming bird, tanagers, orioles, and the like, are familiar and striking examples of this fact. On the other hand, the nonmigratory or resident birds of the temperate zones belong to families mainly distributed outside the tropics and separable, broadly speaking, on other grounds. This state of things points to the explanation that the extratropical parts of the world, depopulated of birds by the cold, ice, and excessive rains of the Pleistocene or Glacial period, were restocked from the crowded intertropical preserves as fast as the amelioration of the climate permitted plants and animals to occupy the temperate and subarctic regions; and that the reactive effect of the new country steadily checked colonization by selecting only those species adapted or adaptive to the new conditions. In this light the seasonal migration of birds must be viewed as an annual excursion, constantly repeated by certain species that have the habit (and not by others), outward from equatorial regions to a greater or less distance poleward.

Beginning of the Seasonal Movement. As the close of the rainy season approaches in the tropics migratory strangers gradually separate themselves from the resident birds, now beginning domestic cares, and disappear. What starts them off just as the rains are bringing an increase of both plant and insect food we do not know. Their ovaries show little preparatory enlargement, and few or none are mated. As they slowly proceed, keeping pace with the lifting sun and the opening spring, they will gradually concentrate upon certain highways, or "migration routes." The old males take the lead, probably merely through superior strength of wing; and it is not until the bulk of these have passed by that the females appear, followed, after an interval, by yearling birds.

The weather encountered, always uncertain, influences this progress decidedly, warm southerly winds encouraging the birds to go forward, while cold spells or northerly storms check them, sometimes for a fortnight or more, and occasionally destroy large numbers. When sunshine and southerly breezes again prevail the accumulated host goes forward in what observers call a "wave" of migration. Such checks are local;

and larger influences have an effect, so that the movement is uniformly earlier in some parts of the continent than in others.

Migration Routes. It is also true that the movement is not uniformly distributed. On the contrary, there are certain definite routes or paths which birds follow in especially great numbers. The greater of these routes, or "fly lines," are generally recognized and seem to be determined partly by topography, but to a greater degree by considerations of security and subsistence. The most thickly frequented routes are along ocean coasts, river valleys, or mountain ranges. European specialists, like Palmen and Middendorf, have outlined several such "fly lines" with great particularity, and when sketched upon a map they are seen to coincide in a general way with the valley system of that continent. Similar highways are traceable in North America. One runs along the Pacific coast and another up the valley of the Rio Grande and along the connected valleys and parks between the parallel ranges of the Rocky Mountains. East of the plains a horde of spring birds enters the United States along the eastern lowlands of Mexico and by way of the West Indies, and soon divides into definite streams of travel. Parted first by the southern extremity of the Alleghanies into two main currents, one goes to the right up the Atlantic coast and through the Hudson Valley and New England, while a second, to the left, ascends the Mississippi, Missouri, and Ohio, diverging more and more up tributary valleys, until all the central and northern parts of the continent are supplied. A little reflection will show how likely, from the nature of the case, are these routes. They are natural bird roads, without obstacles, and they afford easy guidance, plentiful vegetation, and consequent protection against enemies and storms, and the abundance of insect food belonging to watercourses.

Nocturnal and High-Flying Migrants. A large part of the migration of many birds is made at night, especially the natural night fliers, like owls and goatsuckers and the great body of small, timid birds that in their daily life seek concealment and obtain their food in shady, secluded places. It is only the day goes that we ordinarily see migrating, and these more commonly in spring than in fall; but every observer has noted how after a favorable night the woods will be full of birds at dawn where none were to be seen the evening before. English and American ornithologists, led by Baird about 1875, have collected at lighthouses and other watching places systematic data in respect to night migration.

Guidance. What guides these travelers on their annual journeys across continents and over seas? This has been an eager question ever since men began to watch the ways of the birds. If anything approaching a rule has been disclosed it is that diversity prevails rather than uniformity. Birds closely allied in structure, diet, nesting habits, and so forth, vary immensely in the extent and manner of their migrations. While some travel twice a year from the equator to near the poles, others of the same family, or genus even, never leave warm latitudes at all. The increasing perception of this individuality in animals inclines one more and more to believe that migratory birds are guided in the majority of cases by the teaching of their elders, and by their own observation and mem-

ory, rather than by any extraordinary faculties or process. Brewster declares that the manner of migration of birds is determined by one, two, or all of the following considerations, viz.: (1) habitual manner of procuring food; (2) disposition; (3) wing power. Much evidence exists in favor of this simple and practical explanation, but unfortunately contrary and unexplained facts still confront us. European ornithologists assert that there the young of many species precede the adults on their journey southward in the autumn. Cooke and Widman, in their elaborate *Report on Bird Migration in the Mississippi Valley*, say the same for the interior of North America. On the other hand, William Brewster, who has observed this matter with the highest zeal and intelligence, maintains the opposite view as the result of long experience in New England and eastern Canada, and declares that the young never precede older birds in the fall, explaining that the first southward flights of adult birds have been overlooked because they were unexpectedly early. He has elucidated this with much detail in the *Memoirs* (No. 1) of the *Nuttall Ornithological Club*.

That this is the true history of migration in respect to many and various kinds of birds cannot be gainsaid; that it is an all-sufficient explanation is not universally admitted. The powers of recognition and recollection involved are doubted by some; yet all animals are strong in this direction—perhaps no mental faculties are so distinctly manifested by brutes as observation and memory. Examples might be drawn from every class, but homing pigeons are most closely to the point. There can be no reason to suppose other birds are less able in this respect until we have taken pains to exploit their abilities. No mysterious "homing faculty" need be summoned. The great height at which pigeons usually fly enables them to survey a wide extent of country and find some points with which they have been previously familiarized; from this a second is visible, and so on, leading the pigeon straight home as the pioneer follows a blazed trail through a forest. Wild birds may be supposed to do the same, and their wish to get a very wide view of the landscape explains the height to which they rise in these journeys and their descent and confusion in murky weather. From a height of 10,000 feet both shores of the Mediterranean, e.g., would probably be visible to a bird's eye, at any rate in the narrower places where they mostly cross. It must be confessed, however, that this explanation does not cover the case of those birds which migrate across ocean spaces of one or two thousand miles. Here it seems necessary to believe that they are guided by an intuitive sense of direction—a feeling for the points of the compass, so to speak. Something so closely akin to this instinctive power of orientation is observable among other animals, including the human savage, that it may be very well conceded to the birds. The placing of small, marked metal bands on the legs of young birds has recently been carried on extensively both in the United States and Europe, and has already begun to yield valuable, definite results in indicating the general movements of individual birds.

Bibliography. For references to early essays, and to many essays and books in European languages, consult Newton, article "Migration," in *Dictionary of Birds* (New York, 1893-96), and Giebel, *Thesaurus Ornithologie* (Leipzig, 1872-

77); also S. Berthelot, *Oiseaux voyageurs et poissons de passage: étude comparée d'organisme de mœurs et d'instinct* (2 vols., Paris, 1875-76); W. W. Cooke, *Report on Bird Migration in the Mississippi Valley* (Washington, 1888); Palmen, translation by Shoemaker of a report to the International Ornithological Congress at Budapest, 1891, in *Report of the Smithsonian Institution for 1892* (ib., 1893); Gätke, *Die Vogelwarte Helgoland* (Brunswick, 1891), translated by Rosenstock as *Heligoland as an Ornithological Observatory* (Edinburgh, 1895); Whitlock, *The Migration of Birds: A Consideration of Herr Gätke's Views* (London, 1897). This combats many of Gätke's statements and theories. See also C. Dixon, *The Migration of Birds: An Attempt to Reduce Avian Season Flight to Law* (amended edition, London, 1897), an ambitious book of theory, not well sustained; W. E. Clarke, *Studies in Bird Migration* (2 vols., ib., 1912); T. A. Coward, *Migration of Birds* (Cambridge, 1912), containing a bibliography; E. Trouessart, "L'Influence de la guerre sur la faune du pays et les migrations des oiseaux," in *La Natur*, vol. xliii (Paris, 1915). For countless recent articles on migration and bird banding, consult the various volumes of the *Zoological Record* (London); Nuttall Ornithological Club, *Memoirs* (Cambridge, Mass.); the *Auk* (ib.); also S. H. Scudder, *Butterflies of the Eastern United States and Canada* (Boston, 1889); F. E. Beddard, *Book of Whales* (New York, 1900); J. A. Thomson, *The Wonder of Life* (ib., 1914).

MIGRATION OF PLANTS. The natural movement of plants from one area to another. This term is thus somewhat in contrast to naturalization (q.v.). Migration of species is possible by reason of variations in the structural adaptations which are found in most plants. Among these perhaps the most important are the structures which are concerned in the dispersal of seeds and spores, which may be scattered by means of birds, wind, or water to very great distances. Besides these methods of dispersal, certain plants may be scattered in a vegetative way for great distances and become established far from the original home. Thus, the common water weed *Elodea* is believed to have spread all over Europe vegetatively from a single plant introduced in the early part of the nineteenth century. It seems likely that after a time a certain equilibrium between the various species of the world will have been reached and that each particular species will be found in the conditions best suited to it. When this time comes further migration would seem to be without result, whether the scattering of seeds takes place or not. It must be remembered, however, that various factors enter in to disturb any equilibrium which may be formed. In the first place, there are changes in the organic world itself; i.e., new species of both plants and animals are developed from time to time through evolution and new disturbances in the so-called equilibrium must arise. In the second place, the external world suffers tremendous changes. It is probably this last cause which has been most responsible for the migration of plants. Through the geological ages continents have arisen and passed away, and all these changes must have been accompanied by changes in the mutual relations of the species then living. Changes in climate have taken place many times in the world's history, and all of these changes must have been attended with great plant migrations.

To illustrate: the oncoming of the ice epoch caused a southern movement of the climatic zones, and the species which had become adapted to a particular climate moved south to a greater or less degree *pari passu* with the climatic movement. Postglacial times have witnessed northern migrations, which are necessarily much slower than the northern migrations of the southern zones. Plants must not be regarded as less active migrants than animals, though they make no seasonal migrations.

MIGUEL, mé-gäl', DOM MIGUEL MARIA EVARISTO DE BRAGANÇA (1802-66). An aspirant for the Portuguese throne, the third son of John VI of Portugal. He was brought up in Brazil, whither his parents had fled in 1807, and returned to Portugal in 1821 with very little education, a debauchee and a superstitious bigot. He put himself at the head of the reactionary party and plotted the overthrow of his father and of constitutional government. In 1824 he caused his father to be closely guarded, arrested the ministers, and sought to overthrow the government, but failed and was sent into banishment. In 1826 his brother Dom Pedro, Emperor of Brazil, succeeded to the throne. He relinquished the crown of Portugal to his young daughter, Dona Maria da Gloria, and betrothed her to her uncle Miguel, who was made regent. Dom Miguel in 1828 usurped the throne, abolished the constitution, and introduced a reign of terror. Dom Pedro, who had been forced to abdicate the throne of Brazil in 1831, placed himself in 1832 at the head of an expeditionary force, which had been collected by the opponents of Dom Miguel, and proceeded to dethrone the usurper. He entered Oporto in July, and a year later, after the defeat of Dom Miguel's fleet, was in possession of Lisbon. Spain recognized Maria as the legitimate sovereign. England and France followed suit, and Dom Miguel was forced to give up all claims to the crown (1834). He died at Brombach in Baden. To the common estimate of Dom Miguel's character exception is taken by Cardinal Hergenröther in the *Handbuch der allgemeinen Kirchengeschichte*, vol. iii, p. 847 ff., (3d ed., 1886), where he is said to be a noble prince, possessing the affection of his subjects.

MIHRAB, më-räb'. See KIBLAH; MOSQUE.

MIJATOVICH, më-yä'tô-vêch, CHEDOMILLE (1842-). A Servian diplomat and author. He was born in Belgrade; studied at Munich, Leipzig, and Zurich; taught economics at Belgrade (1866); and was general secretary in the Servian Ministry of Finance from 1869 to 1871 and Minister of this department in 1873-75 and of Foreign Affairs as well as Finance in 1880. About 1874 he broke with Ristić, in whose cabinet he had served, and joined the Progressive party. From 1875 on he was a Senator of the Kingdom of Servia. In 1886 he represented Servia in making peace with Bulgaria; in 1894 was Minister of Finance again and Ambassador to Rumania; in 1899 was delegate to The Hague Peace Conference; and in 1895-1900 and (after serving at Constantinople) in 1902-03 was Minister from Servia at the Court of St. James's, resigning after the assassination of King Alexander, which he described in *A Royal Tragedy* (1906). He wrote *Servia and the Servians* (1908), *Servia of the Servians* (1913), and, in Servian, several volumes of history, economics, and fiction. His English wife, Elodie Lawton (died 1908), wrote a *History of Modern Servia* (1872) and *Servian Folk Lore* (1874).

MIKADO, mē-kā'dō (Jap., Exalted Gate). Formerly the popular and official title of the Emperor of Japan, occurring in poetry and history throughout the whole range of Japanese literature. Though comparatively obsolete in the Japan of the twentieth century, the word has found a fixed and honored place in the English language. The Mikado dynasty is probably the oldest in the world, Yoshihito (q.v.) being reckoned by most authors the one hundred twenty-second of the Imperial line, the first being Jimmu Tenno, who in the official chronology began to reign 660 B.C. Descent is claimed from the gods that created heaven and earth. The origin of the line is lost in mythology, and there is little or no historical foundation for it before the fourth century. The first 17 mikados (660 B.C.–399 A.D.) are said to have died at ages ranging from 100 to 141 years. The average reign in the whole line is 20 years. Each mikado has a personal name, but no family name, nor is the name of the mikado ever repeated. Each has also a posthumous title, by which he is known in history. Seven of the mikados were women. See MEIJI TENNO.

MIKADO, THE. A comic opera by William S. Gilbert and Sir Arthur S. Sullivan (qq.v.), first produced in London, March 14, 1885; in the United States, Aug. 19, 1885 (New York).

MIKAL. See LEBENSOHN, MICAH JOSEPH.

MIKA'NIA (Neo-Lat., named in honor of J. C. Mikan, a Bohemian botanist of the nineteenth century). A genus of plants of the family Compositæ, nearly allied to *Eupatorium* (q.v.). *Mikania officinalis* is a Brazilian species, with erect stem and heart-shaped leaves, abounding in a bitter principle and an aromatic oil, reputed useful in medicine. *Mikania amara* and *Mikania cordifolia* (twining herbs), also natives of the warm parts of South America, are among the plants which have acquired a high reputation—deserved or undeserved—for the cure of snake bites. The former is remarkable for the large indigo-blue spots on the underside of its ovate leaves. *Mikania scandens*, sometimes called climbing hempweed, is a native of the United States, growing in moist soils from New England to Texas.

MIKHAILOFF-SHELLER, mē'kā-yil'ôf-shē'lēr, ALEXANDER. See SHELLER, ALEXANDER KONSTANTINOVITCH.

MIKHAILOV, mē-kā-yil-ôf, MIKHAIL LARIONOVITCH (1826–65). A Russian journalist and novelist, born in the Ural Mountains. He was educated in St. Petersburg and began his literary work with translations, chiefly from Heine. These were collected in one volume (1858), and his articles for the *Sovremennik* (*Contemporary*) and other periodicals, as well as his stories, notably *Adam Adamovitch* (1851), were published in two volumes in 1859. He shared the dreams of the revolutionists of his own country and was exiled to Siberia, where he died.

MIKHAILOVSKI, mē'kā-yil-ôf'skē, NIKOLAI KONSTANTINOVITCH (1842–1904). A Russian essayist, critic, and sociologist. He translated one of Proudhon's works into Russian, but it was his critical work on the famous *Annals of the Fatherland* (*Otčestvennyia Zapiski*), with which he was connected from 1869 to its suppression in 1884, that made him famous. For it he wrote literary notes regularly, beginning in 1872, and many papers, on truth, heroes, and the crowd, Darwinism, Socialism, positivism, and the systems of Spencer and Mill. In 1873

he became one of the editors of the *Northern Messenger* (*Sévernii Vēstnik*), and from 1890 to his death he edited the *Russkoe Bogatstvo* (*Russian Wealth*). Mikhailovski's best-known monograph is on *The True Nature of Progress* (trans. into French by Louie, *Qu'est-ce que le progrès?* 1879). Mikhailovski rejects the organic conception of society and holds that social processes are not wholly reducible to biological or intellectual terms. Social progress, in his view, presupposes social justice—the proper division of labor—and is brought about through the conscious and sympathetic coöperation of the individuals striving to realize their full measure of individuality. The end of progress is the identity of truth and justice (Russ., *pravda*). Mikhailovski also wrote several literary studies, notably on Tolstoy (1887) and Shtchedrin (1890). His papers have been collected several times, the latest edition of his *Works* being prepared by Kolosov (St. Petersburg, 1913).

MIKHAILOVSKI-DANILEVSKI, mē'kā-yil-ôf'skē dā'nē-lyēf'skē, ALEXANDER IVANOVITCH (1790–1848). A Russian soldier and historian. He took part in the war with France (1812–13) as Kutusoff's aid-de-camp and was head chancellor of Volkonski in 1813–14. In the war with Turkey (1829) he served as major general, was promoted to be lieutenant general in 1835, and became a member of the war council and Senator in 1839. He wrote a *History of the Turkish War of 1806–12* (1843), besides accounts of his experiences in the campaigns of 1812–13 (1834) and of 1814–15 (1849–50). His collected works were published (1849–50) in seven volumes. They are marked by a freedom of style and a patriotic sentiment that sometimes verged into inaccuracies.

MIKKELSEN, mik'kel-sēn, AKSEL (1849–). A Danish educator, born at Hjørring, the introducer and organizer of sloyd schools in Denmark. In 1872–83 he operated a machine shop, later he organized sloyd schools, finally the Sloyd Seminary in Copenhagen, and in 1907 he was appointed sloyd inspector for Denmark. Through his energetic work as teacher, author, and lecturer he greatly developed this form of education throughout the country. Among his many writings on the subject are: *Hvad er Sløid?* (What is Sloyd?) (1886); *Hvordan arbejder Sløidskolen?* (How Does the Sloyd School Work?) (1886); *Sløidlære* (Instruction in Sloyd) (1894); *Arbejdsstillinger* (Positions when Working) (1896).

MIKKELSEN, EJNAR (1880–). A Danish explorer, born at Vester Brønderslev, Jutland, who served in the Amstrup expedition to Christian XI Land, East Greenland (1900), and in the Baldwin-Ziegler expedition to Franz Josef Land (1900–02). With Leffingwell he organized the Anglo-American polar expedition which wintered at Flaxman Island, Alaska, in 1906–07. They lost their ship, but in a sledge journey over the ice they located the continental shelf of the Arctic Ocean, 65 miles offshore, where in 2 miles the sea increased from 50 meters to more than 690 meters in depth.

Organizing an expedition to map out the northeast coast of Greenland, to recover the bodies of Mylius-Erichsen (q.v.) and Lieutenant Hög-Hagen and their records, Mikkelsen wintered (1909–10) at Shannon Island, East Greenland. His ship sank, and the rest of the party returned home on a whaler. Remaining with his engineer, Iversen, Mikkelsen succeeded

by a series of most remarkable and hazardous sledge journeys in recovering the lost records and in disproving the existence of Peary Channel. The two explorers, who later wintered at Shannon Island, were rescued, when in the direst of extremities, by a Norwegian whaler (1912). Mikkelson's writings are: *Conquering the Arctic Ice* (1909); *Lost in the Arctic* (1913; Ger. trans., 1913); "Mylus-Erichsen's Report on the Non-Existence of Peary Channel," in *Meddelelser om Grönland*, vol. xli., (1913); *The aar paa Grönlandsöstkust* (1914).

MIKLOSICH, mik'lô-shîch, FRANZ VON (1813-91). A famous Slavic philologist of Slovene nationality. He was born in Luttenberg, Styria, studied law at Gratz, and settled to practice in Vienna in 1838. There the famous Kopitar (q.v.) aroused in him an interest in Slavic philology, and he first attracted attention by his review of Bopp's *Comparative Grammar* in 1844. Henceforth he devoted himself to philology, and until his death his productivity was enormous. In 1844 he obtained a position in the Imperial Library and in 1850 was made professor of Slavic philology in the University of Vienna, retaining his post until 1886. He was also government censor of Slavic, Rumanian, and Greek publications. His scientific career is remarkable for profundity of research. Miklosich is not only the founder of modern Slavic philology, but he also greatly promoted the historical study of the Albanian, Gypsy, Hungarian, modern Greek, and Rumanian languages. Aside from numerous articles on special points of phonetics, syntax, archaeology, etc., chiefly published in the *Denkschriften* and the *Sitzungsberichte* of the Vienna Academy of Sciences, the most important of his works are: *Vergleichende Grammatik der slavischen Sprachen* (1852-74; 2d ed. of vols. i, iii, iv, 1876-83); *Formenlehre der altslowenischen Sprache* (2d ed., 1854); *Lexicon Palaeoslovenico Graeco-Latinum* (2d ed., 1865), one of the best of its kind for completeness and the abundance of material; *Altslowenische Formenlehre in Paradigmen* (1874); *Altslowenische Lautlehre* (3d ed., 1878); *Etymologisches Wörterbuch der slavischen Sprachen* (1886). Miklosich also edited several important texts, such as: *Apostolus* (1853); *Lex Stephani Dušani* (1856); *Monumenta Linguae Palaeoslovenica e Codice Suprasliensi* (1857); *Monumenta Serbica* (1858); *Acta et Diplomata Graeca Medii Aevi* (1860-87), with J. Müller. Consult: Jagić, *Encyklopediia Slavijskoi Filologii*, vol. i (St. Petersburg, 1909).

MIKLUCHO-MACLAY, mē-klô'kô-mâ-klî', NIKOLAI (1846-88). A Russian traveler and ethnographer, born in the Ukraine of a noble family. He studied medicine and zoölogy at St. Petersburg and in Germany. After traveling widely in Europe he went with Haeckel to Madeira (1866), visited the Canary Islands in 1867, and after a trip to Morocco in 1870 undertook a great anthropological tour in Oceania. At Sydney he founded a museum and zoölogical station and in 1885 returned to St. Petersburg, where he died before he had classified his collections. He wrote on his travels in New Guinea in Petermann's *Mitteilungen* (1874, 1878) and on the temperature of oceanic depths for the *Bulletin* of the St. Petersburg Academy (1871), and made many other contributions to technical journals in Europe, Asia, and Australia.

MIKNAS, mik'nâs. A town of Morocco. See MEQUINEZ.

MIKOVEC, mé'kô-vêts, FERDINAND BRETISLAV (1826-62). A Bohemian dramatist and archaeologist, born at Bürgstein and educated at Česká Lípa and Prague. He founded the literary journal *Lumír* (1851-64) and edited two volumes of Bohemian antiquities under the title *Starožitnosti a památky země české* (1858-64). He wrote the tragedies *Záhuba rodu Přemyslovského* (The Fall of the Přemyslids, 1851), *Dimitri Ivanovič* (1856), and other dramatic works.

MILAN, mī'l'an or mī-lān' (It. *Milano*, Lat. *Mediolanum*). The second-largest city in Italy, the chief city in Lombardy, and the capital of the Province of Milan. It is situated in the great plain of Lombardy, 400 feet above the sea, on the little river Olona, an affluent of the Po, 93 miles northeast of Turin and 166 miles west of Venice; lat. 45° 28' N., long. 9° 11' E. (Map: Italy, B 2). The climate is rather changeable and trying. It is extremely hot in summer and quite cold in winter, the winds from the frozen Alps sweeping across the Lombardy plain. The thermometer at times drops below zero. The mean annual temperature is 55.4° F.; rainfall, 39.37 inches.

Milan is a fairly symmetrical polygon in shape, the circuit of its customs district being now nearly 20 miles. Its focus is the splendid Piazza del Duomo (Cathedral Square), from which broad avenues and electric railways radiate in all directions. These radials are connected by an inner circle of modernized streets just outside the canal that marks the location of the ancient moat and of the inner and most ancient city. An additional connection is furnished by a splendid boulevard and by a belt electric railway 7 miles long beyond the sixteenth-century walls that are pierced by a dozen gates and are now planted with trees and used as a promenade, commanding the view of the suburbs. The most magnificent of the radials is the modern Via Dante, constructed in 1888, leading from the handsome Piazza de' Mercanti to the spacious Foro Bonaparte, and thence to the New Park, which was formerly a part of a national drill ground. This park is paved with wooden blocks on a concrete foundation, and on each side, next to the front foundation walls of the houses, has large subways containing water and gas pipes, electric wires, etc. It is beautified by a large pond and spacious promenades, and is faced by the Castello Sforzesco, and also by the Anfiteatro dell' Arena, which was constructed by Napoleon I for races and is capable of seating 30,000 persons. The park is lighted by electricity. Adorning the northeastern section of the city are the splendid Giardini Pubblici, surpassed by few gardens on the Continent. The Corso Vittorio Emanuele is one of the most elegant shopping streets in Italy and the centre of traffic in Milan. The Galleria Vittorio Emanuele, connecting the Piazza del Duomo with the Piazza della Scala, is a splendid glass-covered arcade, with shops, designed by one of Milan's distinguished architects, Mengoni. It is in the form of a Latin cross, with a cupola 160 feet in height.

Architecture is superbly represented in Milan, nearly all styles being displayed in rare examples. Bramante dwelt here many years and left his genius impressed on more than one fine monument. The city is particularly famous for fine churches. Of these the principal is the world-renowned Gothic cathedral, the Duomo of

Milan, one of the finest of ecclesiastical structures, ranking with St. Peter's at Rome and the cathedral of Santa Maria del Fiore at Florence. The vast church has an exterior of white Carrara marble, which is adorned by 98 pinnacles and with more than 4000 statues, besides a variety of carvings of unsurpassable beauty. In form it is a Latin cross, with a length of 486 and a breadth of 287 feet, and covers an area of 14,000 square yards. The height of the tower is 356 feet. The great windows of the choir, said to be the largest in the world, are of stained glass of 1844. Its foundation was laid in 1386 by Gian Galeazzo Visconti, and during its erection many of the greatest European architects contributed designs for its embellishment. Within it Napoleon was crowned King of Italy in 1805. The baroque façade, completed in 1805 after designs by Tibaldi, has been considered out of harmony with the Gothic style of the other portions of the structure, and the inharmonious features began to be removed in 1900, to be replaced by features in keeping with the general style of the structure. At the front of the cathedral is a colossal bronze statue of Victor Emmanuel II. The view of the Alps, Lombardy, and the city from the top of the cathedral is celebrated. The quaint mediæval church of Sant' Ambrogio, erected on the site of a church founded by St. Ambrose in the fourth century, possesses inscriptions, sarcophagi, and monuments full of antiquarian interest, and is historic as the place where St. Ambrose baptized St. Augustine and where the German emperors were crowned kings of Italy. There are also the Dominican church of Santa Maria delle Grazie, which contains in its refectory the now almost obliterated picture of the "Last Supper" by Leonardo da Vinci; the church of San Carlo Borromeo (1847); and San Nazaro, which possesses a masterful fresco by Lanino, and also San Sebastiano, once a Roman temple. The church of San Satiro has a beautiful sacristy—a creation of Bramante. The mural paintings of Luini in the church of San Giorgio al Palazzo are visited by all art lovers. San Lorenzo is an important church, and is in addition the oldest one in the city, tracing its history back to Roman times.

Of the secular buildings of Milan the most noteworthy is the magnificent Brera Palace, formerly a Jesuit college and now used for the fine arts, with the official name of Palace of Arts and Sciences. (For illustration, see *LOMBARDY, RENAISSANCE ARCHITECTURE OF*.) Within its vast precincts this unique institution includes an academy of art, a choice gallery of paintings of the Bolognese and Lombard schools, a fine collection of casts for modeling purposes, a splendid national library containing about 300,000 volumes and pamphlets, and a rare collection of coins numbering 60,000, with many rare manuscripts and antiquities. It has also attached to it an observatory and a botanical garden. The masterpieces of painting here include Raphael's far-famed "Sposalizio," Mantegna's "Pietà," and Bellini's "St. Mark." The Brera has been greatly enlarged latterly, and many pictures of high rank have been added to its collection. One of the features of the national library is a room devoted to the editions and autograph writings of Manzoni. Another large library is the Ambrosian (q.v.). The Borromeo Palace also has a meritorious collection of paintings. The Museo Poldi-Pezzoli offers a fine collection of

paintings, weapons, furniture, porcelain, etc. The Museo Civico is worthy of mention for its superb ornithological collection. There is also a permanent art exposition, and Milan now has good scientific collections.

The Palazzo Reale and the archiepiscopal palace are old and have some attractive features. The fine and elaborate Castello di Porta Giovia dates from 1368 and is the castle of Milan, being associated with the city's governmental and historic career. Among the noteworthy new and attractive secular buildings are the Exchange, finished in 1901, the prefecture, and Palace of Justice. Notable features in the city also are the Court of the Marino Palace, the Corinthian Colonnade, the finest relic of Roman times in Milan, and the well-known triumphal arch begun by Napoleon I. Other conspicuous public monuments are the statues of Victor Emmanuel II and of Cavour, Canova's notable statue of Napoleon I, the huge equestrian statue of Garibaldi, an equestrian statue of Napoleon III in commemoration of Magenta, the monument to Leonardo by Magni, the statues of Cardinal Borromeo and Parini, and the monument to Manzoni. The Cimitero Monumentale, with its decorative tombs and its elaborate cremation temple, is visited by all tourists. Milan is famous for its vast Scala Theatre, which was built in 1178 for operas and ballets. It accommodates 3600 persons and is the largest theatre in Europe after the San Carlo at Naples. Milan is the centre for music in Italy. The famous Conservatory of Music is established in the buildings of an ancient monastery.

Milan has an Academy of Science and Literature, a college for girls, and medical, high, and normal schools. The fine polytechnic, dating from 1865, a commercial academy, an agricultural school, a royal astronomical observatory, and an Accademia di Belle Arti are other educational institutions. There are also a municipal zoological collection, botanical gardens, and theatres. The government of the city is highly efficient and enormous sums have been expended on public improvements. The system of sewers, about 50 miles in length, empties into the swift covered-over Seveso, whence the sewage passes to the Adriatic by way of the Po. The city water for domestic purposes comes principally from large artesian wells, about 150 feet in depth, and for industrial purposes from the canals. The different philanthropic organizations under the control of the Board of Charities have property valued at over \$53,000,000 and a yearly income of \$1,600,000. The municipal schools are well organized, with 80 buildings and 50,000 pupils, in addition to which are evening schools attended by over 10,000 older pupils. The Maggiore hospital is one of the largest in the world, accommodating 4000 patients. It dates from 1456. There are deaf-and-dumb institutions and institutions for surgical operations and for ailments of the eyes. Milan has also public dormitories, soup kitchens, etc. The Milan poor suffer greatly from overcrowding. An official investigation showed that 38,000 families were living in one room each and that 333,000 persons, or 70 per cent of the population, were living in 172,417 rooms. Thousands of these rooms had no light except through the entrance door. In 1905 the citizens voted for municipal construction of houses for the working people, providing for an expenditure of \$1,000,000 for the erection of 48 tenement houses to

MILAN
THE CATHEDRAL

contain 500 apartments of one, two, and three rooms each. The Humanitarian Society also appropriated \$400,000 for the building of model tenements.

Milan is the leading financial city of Italy and possesses vast wealth. It markets large quantities of grain, cheese, butter, eggs, and poultry, and its manufactures include silk, leather, and woolen goods, stationary engines, locomotives, railway machinery, steam boilers, motors, automobiles, carriages, furniture, glass and earthenware, and chemical products. Cotton weaving and dyeing are also an important industry. A royal mint and a royal tobacco factory are situated here, and there is a corn exchange. It is the centre also of the Italian book trade. Not only are its industries by far the most important in Italy, but its commerce is very extensive. The Grand Canal connects the navigable Olona with Lake Maggiore and the Ticino. The city is also in canal communication with the Po, and with Lake Como through the Adda. It is an important centre of the national railway system. Milan is connected by street railways with the neighboring towns of Lombardy. The local system of electric street railways is excellent. In the last 20 years of the nineteenth century Milan grew more rapidly than any other Italian city. Pop., 1810, 124,000; 1860, 191,000; 1881, 321,839; 1901, 491,460; 1911, 599,200.

History. Livy (v, 34) declares that Milan, the ancient Mediolanum, or Mediolanium, was founded in the time of Tarquinius Priscus by Gauls who had come over the Alps. The ancient name is regarded as Celtic. Milan appears first definitely in history in 222 B.C., when it was taken by the consuls Cn. Scipio and Marcus Marcellus from the Gauls. Later, the town sided with Hannibal; its final and complete submission to Rome dates from 196 B.C. Its inhabitants became Roman citizens in 49 B.C.; in the second century A.D. it was colonized from Rome. Since roads ran from the city in all directions its trade rapidly increased. It rose to great prominence at the close of the third century A.D., when Diocletian made it the capital of Italy. Thereafter Milan was frequently a favorite Imperial residence. It was from Milan that Constantine issued in 313 the famous edict by which Christianity was recognized. Milan became the seat of a bishop, and from 374 to 397 this office was held by the celebrated Ambrose (q.v.). He established a ritual which in some points varied considerably from the Roman, and for a time Milan was the religious metropolis of northern Italy and almost entirely independent of Rome. This first era of prosperity was destroyed by the barbarian invasions by Attila (q.v.) in 452, by the Heruli under Odoacer in 476, and by the Goths under Theodoric in 493. In 539 the city was laid waste by the Goths so completely that but few remains of the city of Roman times have been found; these include a theatre, much below the present level of the ground. Many inscriptions, however, showing clearly the Celtic character of the population have been found; for these see the *Corpus Inscriptionum Latinarum*, vol. v. Only in the tenth century did Milan begin to recover.

During the greater part of the Middle Ages the population of Milan was divided into great nobles (*capitanei*), petty knights (*valvassores*), and the general populace. For a long time the history of the city turns upon conflicts between

these various classes. In 1036 the Archbishop Aribert sought to make himself independent of all ecclesiastical and temporal control and for this purpose united with the *capitanei*. He was, however, opposed by the Emperor Conrad II, who was aided by the *valvassores*. The Emperor in 1037 captured and imprisoned Aribert, but he escaped after two months, and the death of Conrad in 1039 put an end for a time to the conflict. But a long-continued revolt against Aribert resulted in the people's obtaining a share in the government. Henry III (1039-56) ruled the whole Empire (Italy included) with a firm hand, but during his reign the forces developed which resulted in the great conflict of the *Patavia* after his death. According to the Ambrosian rules priests were permitted to marry, but Hildebrand (later Pope Gregory VII) attempted to establish sacerdotal celibacy and also sought to connect the church of Milan more closely with that of Rome. He was aided in this attempt by the lower classes of the populace, who were known as *patarini*, i.e., ragamuffins, and were in reality infected with the Manichean heresy. Opposed to this whole movement were the Archbishop and his party, supported by the Emperor, Henry IV (1056-1106), who was also at war with the papacy. The conflict was violent, but terminated with a compromise, by which marriage of priests was forbidden for the future, but those who were married were allowed to retain their wives. The independent position of the archbishops, however, was gone forever, and the way was clear for the establishment of a republican commune, especially as a very powerful artisan class had gradually developed.

By the end of the eleventh century Milan was practically free from external government and was ruled by consuls elected by the three orders; it rapidly acquired a hegemony over the other Lombard cities. When, however, Frederick Barbarossa became Emperor he proceeded to reestablish the old Imperial power in Italy, and in 1153 began with Milan. Twice the city was compelled to submit, in 1158 and 1162, and the last time it was razed to the ground. The cities of northern Italy, which at first had been glad to witness the destruction of a rival, now, however, saw their own danger and hastened to the assistance of Milan under the leadership of Pope Alexander III. The Lombard League was formed against the Emperor, and in 1176 Frederick was defeated at Legnano, and in 1183 by the Peace of Constance recognized the independence of Milan and the other cities of Lombardy. After these foreign dangers were averted intestine strife again broke out between the various factions—the plebians, who had united in the *Credenza di Sant' Ambrogio*; the merchants; the lesser nobles, or *motta*; the great nobles, or *Società dei Gagliardi*. Wearied by these continuous quarrels, the citizens began to call in foreigners to rule and mediate, thus giving rise to the office of the *podestà*. In 1226 the Lombard League was renewed to prevent the aggressions of Frederick II, who was finally defeated in 1237 at the battle of Cortenuova.

In the thirteenth century Milan gradually lost its republican liberties. In 1259 the Guelph leader Martino della Torre headed the citizens in a struggle against the Ghibelline nobles and temporarily assumed the lordship of the city. But in 1277 a revolution was effected by the Ghibellines under the Archbishop Otto Visconti, who in turn became the ruler of the city, and at

his death in 1295 the power passed to his nephew Matteo Visconti, who had already been appointed Imperial vicar of Lombardy. From that time the Visconti (q.v.) ruled Milan almost continuously until 1447. Under their supremacy was not only Milan, but the whole of Lombardy; the arts were fostered and prosperity was general. In 1395 the Emperor Wenceslas granted Gian Galeazzo Visconti the title of Duke of Milan. The last of the Visconti, Filippo Maria (1412-47), after a short-lived republic, was succeeded in 1450 by his son-in-law, the celebrated *condottiere* Francesco Sforza (q.v.). The Sforzas were the typical princes of the Renaissance, patrons of art and learning, but at the same time guilty of the greatest cruelties. Milan became involved in the many Italian wars of the period, and finally Lodovico Sforza called in Charles VIII of France, who entered Italy in 1494. From this time on the history of Milan as such has little interest. Louis XII of France, as the descendant of the Visconti, claimed Milan, and the city and duchy for a while changed hands repeatedly between the French and the Sforzas, the latter being supported by Spain. In 1535 the last of the male line of the Sforzas died and Milan became a Spanish possession. In 1713 the Peace of Utrecht, which ended the War of the Spanish Succession, gave Lombardy to Austria. In 1797 Milan became the capital of the Cisalpine Republic, founded by Napoleon, and in 1805 the capital of the Napoleonic Kingdom of Italy. The Congress of Vienna in 1815 gave Lombardy back to Austria, and Milan shared with the rest of the Hapsburg possessions the oppressions of the Metternich régime. On March 18, 1848, the inhabitants rose in insurrection, and on March 23 General Radetzky was compelled to evacuate the city, which was occupied by the Sardinian forces. On August 6, however, Radetzky reentered Milan. The riots of March, 1849, and Feb. 6, 1853, were vigorously suppressed by the Austrian commanders. In 1859, after the battle of Magenta, the Austrians evacuated the city, which was handed over to Napoleon, who surrendered it to Sardinia with the rest of Lombardy. In May, 1898, it was the scene of serious bread riots.

MILAN, mī'lan. A city and the county seat of Sullivan Co., Mo., 112 miles by rail northeast of Kansas City, on the Quincy, Omaha, and Kansas City and the Chicago, Burlington, and Quincy railroads (Map: Missouri, C 1). It is in a farming and stock-raising region, which has some mineral deposits, particularly of coal. The principal industrial establishments are the coal mines and the shops of the Quincy, Omaha,

and Kansas City Railroad, Milan being a division point on that road. The water works and electric-light plant are owned by the city. Pop., 1900, 1757; 1910, 2191.

MILAN DECREES. See CONTINENTAL SYSTEM.

MILANESI, mē-lā-nā'zē, GAETANO (1813-95). An Italian art historian, born at Siena. He studied law in his native city; was employed in a public library; and in 1856 became a member of the Accademia della Crusca. In 1858 he was made assistant keeper of the Tuscan archives at Florence; later took charge of the Medici archives; and in 1889 was appointed director of archives. He retired in 1892. Besides preparing an important edition of Giorgio Vasari's *Vite de' più eccellenti pittori, scultori, ed architetti* (9 vols., 1878-85), and *Les correspondants de Michel Ange*, only 1 vol. of which ("Sebastiano del Piombo," 1890) appeared, Milanese published: *Il diario inedito di Alessandro Sozzini* (1842); *Documenti per la storia dell' arte senese* (3 vols., 1854-56); *Discorsi sulla storia civile ed artistica di Siena* (1862).

MILANÉS Y FUENTES, mē'lā-nās' é fwān'tās, JOSÉ JACINTO (1814-63). A Cuban poet, born at Matanzas. His first verses appeared in the *Aguinaldo Habanero* (1837) and were favorably received. From this time his work was well known. His early life had been one of poverty and hardship, but afterward he obtained a satisfactory position and was able to travel abroad in 1848. He had been the victim of a mental disease for some time, and during the last years of his life was quite insane. The poetry of Milanés is contemplative and melancholy and, like that of his fellow poets Heredia and Plácida, saddened by the thought of his country's wrongs. Editions of his poems were published at Havana (1846) and New York (1865), the latter with biography and criticism by Federico Milanés.

MILAN OBRENOVITCH (mē'lán ô-brēn'ô-ŭich) IV (i.e., fourth in the Obrenovitch (q.v.) family) (1854-1901). Prince of Servia from 1868 to 1882 and King from 1882 to 1889. He was born Aug. 22, 1854, at Manassée, Rumania, and was educated at Paris. The assassination of Prince Michael III in 1868 caused his recall to Servia, where he was proclaimed Prince. A council of regency administered the government till he was 18. The revolt of Servia against the Ottoman power, its alliance with Russia in the Russo-Turkish War (q.v.), and its resulting independence and recognition as a kingdom (1882) made his reign memorable. In 1875 he married Natalie Ketchko, the daughter of a Russian colonel, and his quarrels with her and his personal vices deprived him of all prestige. In 1888 he was illegally divorced, and on March 6, 1889, he abdicated in favor of his son Alexander I (q.v.). He became reconciled to Natalie in 1893 and died at Vienna, Feb. 11, 1901. See SERVIA.

MILÁ Y FONTANALS, mē-lā' é fôn'tā-nāls', MANUEL (1818-84). A Spanish historian of literature, born at Villafranca del Panadés. He was appointed professor in the University of Barcelona in 1845. He did not obtain wide celebrity until he was appointed president of the Floral Games at Barcelona in 1859. The influence of his philosophical studies is apparent even in so early a work as his *Arte poética* (1848). This was followed by the *Romancillo*

catalán (1848), a collection of the lyrics of his native region, and by the *Elementos de literatura* and the *Teoría literaria*, which apply philosophical methods to the study of literature. His *Observaciones sobre la poesía popular* appeared in 1853. His noblest productions are *Los trovadores en España*, (1861) and *La poesía heroico-popular* (1874). Consult: Rubió y Ors, *Noticia de la vida y escritos de D. Manuel Milá y Fontanals* (Barcelona, 1887), and the edition of his *Obras completas* (id., 1885), prepared by M. Menéndez y Pelayo, who never wearied of praising Milá y Fontanals as a great scholar and a great teacher.

MILAZZO, mè-lát'sò, or **MELAZZO**. A city in the Province of Messina, Sicily, 16 miles by rail west of the city of Messina, at the base of a narrow peninsula, 4 miles long (Map: Italy, E 5). It has a very large and safe harbor which serves as a refuge for vessels trying to make the north entrance of the Strait of Messina. Its thirteenth-century castle is now used as a jail. It has a city hospital, a technical school, a city library of 10,000 volumes, and a municipal theatre. It markets wine, fish, cattle, fruit, and sulphur and has a considerable foreign trade and extensive tunny fisheries. Pop. (commune), 1910, 16,422; 1911, 16,569. Milazzo is on the site of the ancient Mylae, founded prior to the eighth century B.C. by colonists from Messina. A great naval victory was won here over the Carthaginians in 260 B.C. by G. Duilius. The crowning point of Garibaldi's victorious Sicilian campaign was his defeat of the Neapolitans here, July 20, 1860.

MILBANK, JOSEPH (1848-1914). An American philanthropist, born in New York City. Between 1896 and 1903, together with his sister, Mrs. Elizabeth Milbank Anderson, he gave \$3,000,000 to Teachers and Barnard colleges, Columbia University. Connected with the former is Milbank Memorial Chapel and with the latter Milbank Hall. In 1901 he established the Milbank Baths at a cost of \$150,000, and in 1905 he gave \$200,000 to found the Jersey City People's Palace, a clubhouse for the people under the control of the First Congregational Church of Jersey City. With his sister he gave \$650,000 to establish a Social Welfare Bureau and \$500,000 to the Children's Aid Society. In all they gave nearly \$5,000,000.

MILBURN, WILLIAM HENRY (1823-1903). An American clergyman. He was born in Philadelphia and educated at Illinois College. He entirely lost the sight of one eye and partially that of the other while he was a boy, and finally became wholly blind. He became a minister of the Methodist Episcopal church in 1843 and was appointed to circuits in Illinois and the South, with several appointments at Montgomery, Ala., in 1848, and Mobile in 1850, and for two years after 1852 preached in an independent church. He was ordained a deacon in the Protestant Episcopal church in 1865 and priest in 1866, but returned to the Methodist Episcopal church in 1871. He was elected chaplain of Congress in 1845 and 1853, chaplain of the House of Representatives in 1885 and in succeeding terms, and was chaplain of the Senate from 1893 to 1902. He published *Rifle, Axe, and Saddlebags, Symbols of Western Character and Civilization* (1856); *Ten Years of Preacher Life, Chapters from an Autobiography* (1858); *Pioneers, Preachers, and People of the Mississippi Valley* (1860), comprising lectures

given at the Lowell Institute in 1854; *The Lance, Cross, and Canoe in the Valley of the Mississippi* (1893).

MIL/COM. The national god of Ammon, mentioned in 1 Kings xi. 5, 33; 2 Kings xxiii. 13; Jer. xlix. 13; probably 2 Sam. xii. 30; and also 1 Kings xi. 7, where the true reading seems to be supplied by the Greek version. The name is clearly derived from *melek*, 'king,' and the final *m* probably represents the old determinative mimmat. If Milcom was the original reading in 2 Sam. xii. 30, it would seem to indicate that the Ammonitish god was represented by an idol in human form. There is no evidence that this deity was also called Molech (q.v.) or that children were sacrificed to Milcom, though it is not in itself improbable that this rite was practiced by the Ammonites on extraordinary occasions, as it certainly was by their kinsmen, the Moabites. (See MOAB.) Solomon erected a sanctuary to Milcom on the Mount of Olives, possibly on the site of the present Jebel batn el hawa, which Josiah afterward defiled. (2 Kings xxiii. 13.)

MILDER-HAUPTMANN, mël'dër-houpt'màn, ANNA PAULINE (1785-1838). A German opera singer, born at Constantinople, the daughter of an Austrian attaché. She studied under Tomascelli and Salieri in Vienna; made her first appearance in that city in 1803, but was at the height of her power in Berlin (1815-29). She toured Russia, Sweden, and Denmark at the close of her stage career. She was one of the earliest examples of a great vocalist possessed at the same time of extraordinary histrionic ability. For this reason Beethoven chose her to create the rôle of Leonora in his *Fidelio*.

MIL/DEW (AS. *meledēaw*, honeydew, from **mele*, Goth. *miliþ*, Lat. *mel*, Gk. μέλι, *meli*, honey + *dēaw*, dew). A somewhat indefinite term used to designate a number of plant diseases that are caused by fungus parasites, as well as spots caused by microscopic fungi on cloth, paper, leather, glassware, etc. In England the term as applied to plant diseases has a much wider significance than in the United States. It is there made to include what are known in America as cereal rusts and smuts, as well as many other diseases not recognized as due to the mildews proper. In the United States the mildews are divided into two classes: the true or powdery mildews, due to fungi belonging to the family Erysiphaceæ; and the false or downy mildews caused by fungi of the family Peronosporaceæ. The powdery mildews attack the leaves, stems, flowers, and fruits of many of the most valued plants. For the most part they form superficial flourlike patches of white upon their host plants. The fungus most commonly develops over the surface of the leaves and sends minute suckers into the epidermis, by which they absorb nourishment from the host. They cause distorted and stunted growth and often the death of the part of the plant affected. During the summer the fungus sends up numerous branches, which bear myriads of one-celled spores called conidia, by which the mildew is rapidly spread to other plants. Later in the season thick-walled resting spores are produced, by which the fungus is carried through the winter. These spores have appendages of various kinds, by which they retain their attachment to the leaves, and in the spring they develop a new generation of thin-walled spores for the spread of the disease. There are about 150

described species of powdery mildews, and there are very few plants that are not subject to attack from some of them. Among the common ones injurious to economic plants are the apple, pear, and cherry mildew (*Podosphaera oxycanthæ*), rose mildew (*Sphaerotheca pannosa*), hop mildew (*Sphaerotheca castagnei*), grape mildew (*Uncinula spiralis*), mildew of wheat and other grasses (*Erysiphe graminis*), gooseberry mildew (*Sphaerotheca mors-uvæ*), cucumber mildew (*Erysiphe cichoracearum*), which also attacks verbenas, sunflowers, asters, and other plants, pea mildew (*Erysiphe polygoni*), etc. Downy mildews are internal parasites which grow through the tissues of the plants that bear them and only appear outside to shed their microscopic spores. The branches of the fungus bearing these spores are often so abundant as to give a peculiar downy or frosty appearance to the leaf or other part of the plant infested. The spores (conidia) are one-celled, thin-walled, and readily blown about by the wind. Falling upon a new leaf or plant, if the moisture conditions are favorable, they quickly germinate and set up a new infection. In this way they spread with great rapidity and often produce epidemic outbreaks of disease. The resting spores are formed within the tissues of the host and are thus carried over from season to season. They are liberated by the decay of the tissues surrounding them, and from these a new generation is derived. Among the downy mildews are some of the most serious plant parasites. The more common ones are the potato rot or mildew (*Phytophthora infestans*), the grape downy mildew (*Plasmopara viticola*), lima-bean mildew (*Phytophthora phaseoli*), lettuce mildew (*Bremia lactuæ*), onion mildew (*Peronospora schleideni*), beet mildew (*Peronospora schachtii*), cucumber and melon downy mildew (*Plasmopara cubensis*), downy mildew of radishes and other cruciferous plants (*Cystopus candidus*), etc. Most of these mildews are more fully described under the diseases of their respective host plants. The problem of combating them has been a subject of much experimentation in America and in Europe. It has been found that many of the powdery mildews can be held in check and often serious loss prevented by dusting the plants with sulphur, or, if in a house or frame where it can be done, exposing them for a few moments to the fumes of boiling, but not burning, sulphur. Spraying thoroughly and repeatedly with Bordeaux mixture, ammoniacal copper carbonate solution, or other standard fungicide (q.v.) will prevent the serious attack of both classes of mildews. Success in these preventive treatments depends upon thoroughness. See DISEASES OF PLANTS; FUNGI, ECONOMIC; Plate of FUNGI, TYPES OF; PERONOSPORACEÆ; PHYCOMYCETES.

MILE. A measure of length in common use in Great Britain and the United States and their colonies. The name was also in use in the continent of Europe to designate generally a much larger measure of length, although the official measure is now generally the kilometer (.6213 mile). The mile is derived from the Roman *milliare*, which contained 1000 paces (*mille passuum*) of 5 Roman feet each, the pace (*passus*) being the length of the double step (*gradus*) made by one foot from the time it was taken off the ground until it was put down again. The Roman foot being between 11.62 and 11.65 English inches, the Roman mile was

thus less than the present English mile by from 142 to 144 yards. The mile is found referred to in a law of King Athelstane (925-940 A.D.) and as a unit of length has not altered from before the Norman Conquest to the present time. On the continent of Europe previous to the general adoption of the metric system, the length of the modern mile in different countries exhibited a remarkable diversity not satisfactorily accounted for. In some cases, such as the Prussian mile, which was 4.68 statute miles, and the Swedish mile, equal to 6.648 statute miles, the length was far in excess of current understanding of the measure. Such miles, however, have long been obsolete and are only interesting to the student of metrology or the surveyor working on old maps. Before the time of Elizabeth scientific writers made use of a mile of 5000 English feet, from the notion that this was the Roman mile, forgetting the difference in value between the English and the Roman foot. The present English statute mile was incidentally defined by an act passed in the thirty-fifth year of the reign of Elizabeth to be "8 furlongs of 40 perches of 16½ feet each"—i.e., 1760 yards of 3 feet each—and it has since retained this value. The *geographic, nautical, or sea mile* is variously defined as (a) the length of a minute of latitude at any point, (b) the mean length of a minute of latitude (6082.66 feet), and (c) the length of a minute of longitude on the equator (6087.15 feet). The United States Coast Survey has adopted as the standard geographic mile the length of a minute of latitude of a sphere having the same surface as the earth. This gives a length of 6080.27 feet. The British Admiralty mile is 6080 feet. The United States nautical, sea, or geographical mile as given by the National Bureau of Standards (Circular 47, 1914) is 6080.20 feet. As the United States statute mile is 5280 feet, a nautical mile is 1.151553 statute miles, or 1853.249 meters. For ordinary purposes of navigation the nautical mile is assumed to be equal to a minute of latitude in the region navigated, the error being inappreciable in the calculations. See WEIGHTS AND MEASURES; METRIC SYSTEM; and the various authorities referred to thereunder.

MILE'AGE. Compensation reckoned at so much per mile in lieu of traveling expenses usually allowed public officers who are compelled to journey to the seat of government in order to discharge their official duties. It is usually reckoned according to the shortest route by which the officer is able to travel. American army officers traveling under orders are allowed seven cents a mile; Senators and Congressmen are allowed 20 cents a mile when traveling to the seat of government at the opening of a session and to their homes at its close. An abuse of the system is constructive mileage, allowed for distances not actually traveled, as when the time between the close of one session and the opening of another is too brief to admit of a return of Senators and Congressmen to their homes.

MILELLI, mē-lē'lē, DOMENICO (1841-1905). An Italian poet, born at Catanzaro in Calabria. His poetry shows much imagination, but little sustained force. His *Odi pagane* (1879) were much criticized, not only for their pagan spirit, but on account of attacks on Manzoni. Other works are: *In giovinezza* (1879); *Gioconda* (1874); *Hiemalia* (1874); *Povertà* (1879); *Discerpta* (1881); *Il rapimento di Elena*

(1882); *Canzoniere* (1884); *Verde antico* (1885); and *Miscellanea* (1886), a volume of essays. Consult Patari, *L'opera poetica di D. Milelli* (Cosenza, 1912).

MILES, NELSON APPLETON (1839–). An American soldier, born at Westminster, Mass., Aug. 8, 1839. He received an academic education and between 1856 and 1861 was engaged in business in Boston. During the Civil War he rose from the rank of first lieutenant of the Twenty-Second Massachusetts Infantry to be major general of volunteers (Oct. 21, 1865). "For highly meritorious and distinguished conduct throughout the campaign and particularly for gallantry and valuable services at the battle of Reams Station, Va." he was brevetted major general of volunteers (Aug. 25, 1864), and March 2, 1867, he received brevets of brigadier general and major general for services at Chancellorsville and Spottsylvania respectively. He had fought also at Antietam, Fredericksburg, and in the campaign before Richmond (1864). His conduct at Chancellorsville, where he had been seriously wounded, brought him the congressional medal of honor in 1892. After the war General Miles became an officer in the United States army, being appointed colonel of the Fortieth Infantry in July, 1866, and rising to be brigadier general (1880), major general (1890), and lieutenant general (in pursuance of an Act of Congress of June 6, 1900). Upon the retirement of General Schofield in 1895 he became senior officer commanding the army. During a period of about 15 years Miles was known chiefly for his distinguished services against the Indians in the West. In 1875 he defeated the Cheyenne, Kiowa, and Comanche tribes, and in 1875 the Sioux and Nez Percés in Montana. After his campaign (1886) against the Apaches, in which he compelled their chiefs, Geronimo and Natchez, to surrender, he received the thanks of the legislatures of Kansas, Montana, New Mexico, and Arizona. In 1890–91 he suppressed Indian outbreaks in South Dakota. During the railroad strike troubles of 1894 in Chicago he commanded the Federal troops ordered by President Cleveland to prevent interference with the carriage of the mails. Later he represented the United States army at the seat of the Turco-Grecian War, and on the occasion of Queen Victoria's Diamond Jubilee (1897). During the war of 1898 against Spain he directed in person the occupation of Porto Rico. Within two weeks the entire western part of the island was cleared, the total loss of Americans being only four killed and forty wounded. In 1902–03 General Miles made a tour of inspection in the Philippine Islands. He was retired Aug. 8, 1903. The degree of LL.D. was conferred on him by Harvard, Brown, and Colgate universities. He published *Personal Recollections, or from New England to the Golden Gate* (1897); *Military Europe* (1898); *Observations Abroad* (1899); *Serving the Republic* (1911).

MILES CITY. A city and the county seat of Custer Co., Mont., 114 miles by rail northeast of Billings, on the Chicago, Milwaukee, and St. Paul and the Northern Pacific railroads (Map: Montana, L 3). Farming, cattle and sheep raising, and the manufacture of saddlery are the chief industries. It is a jobbing centre and shipping point for considerable quantities of wool, and a large market for range horses. In 1914, 28,442 horses were sold here at auction. The water works and electric-light plant are

owned by the city. Miles City contains a county hospital, a beautiful park on the Tongue River, an Ursuline convent, a well-equipped high school, a State industrial school, and a public library. Pop., 1900, 1938; 1910, 4697; 1915 (state census), 7621.

MILES GLORIOSUS, *mīlēs glō'ri-ō'sūs* (Lat., braggart soldier). A comedy by Plautus.

MILESIANS. The original Gaelic colonists of Ireland, so called, according to the bardic accounts, from the three sons of Mil (Latinized Milesius), who, coming in force from the opposite coast of Spain or Gaul, landed on the southern end of the island and defeated the preceding colonists and conquerors, the Tuatha De Danann, in two great battles, thus making themselves masters of the country. The date is indefinitely placed some centuries before the Christian era. This was the last of the traditional prehistoric colonizations of Ireland, the dominant Milesians fusing with the Tuatha De Danann (q.v.) and Firbolgs (q.v.) to form the Irish race as we find it at the dawn of history. The native kings, chieftains, and prominent families up to the period of the Norman Conquest all claimed direct descent from Milesian ancestry.

MILESIAN TALES (*Μιλησιακά, Milēsiaka*). The name given to a class of short, indecent anecdotes in vogue at Miletus and through Asia Minor in the first century B.C. The compilation of six books of these stories was ascribed to a certain Aristides of Miletus. Fragments of these works, from the translation by Sisenna (q.v.), are printed in Bücheler's small edition of Petronius (5th ed., Berlin, 1882). Consult H. T. Peck, *Trimachio's Dinner*, pp. 20–32, 40–44 of the "Introduction" (New York, 1898), and L. C. Purser, *The Story of Cupid and Psyche as Related by Apuleius*, xix–xxi, pp. 125–127 (London, 1910).

MILET DE MUREAU, *mē'lā' de mūrō'*, LOUIS MARIE ANTOINE DESTOUFFE, BARON (1756–1825). A French soldier and politician, born at Toulon. He entered the army and was made a captain. As a member of the States-General, in 1789, he voted with the Right; afterward he commanded the artillery in the army of occupation in Italy. He was made a brigadier general in 1796; was War Minister for a few months in 1799; was created Baron by Napoleon in 1809; served as a prefect of the Department of Corrèze in 1802–10 and director of the general War Department in 1814, but retired two years afterward. He edited the *Pérouse journals*, which were published under the title *Voyage de La Pérouse autour du monde 1785–88* (1797; 2d ed., 1798).

MILETUS (Lat., from Gk. *Μίλητος, Milētos*). Anciently the greatest city of Ionia (q.v.) in Asia Minor (Map: Greece, Ancient, E 3). It was situated on the Latmic Gulf, at the mouth of the Meander, in a rich valley, and was famous for its woolen manufactures and for its extensive trade with the north and the south, and with Phrygia. The site is said to have been occupied by a Carian town when the Ionian colonists, under Neleus, seized the place, massacred the men, and took possession of their wives. Pottery found by Wiegand (see the bibliography below) proves that the city was in touch with the *Ægean* civilization in the latest Minoan period. (See *ARCHÆOLOGY*, II, *Minoan*, or *Ægean*, *Period*.) Though the inhabitants prided themselves on their Ionian descent, the names of their tribes show the presence of a foreign element. The

city early came to occupy a commanding position in the Greek commercial world and established many colonies in the north, as Abydos and Lampsacus, on the Hellespont; Cyzicus, on the Propontis; Sinope, Olbia, Istria, Tomi, and Panticapæum, on the Black Sea. Under the tyrant Thrasybulus it offered so resolute a resistance to the Lydian kings that it was at last received into an alliance on equal terms. By 500 B.C. it was one of the first Greek cities, if not actually the first. It took a prominent part in the Ionian revolt (500 B.C.; see IONIA), and after the battle of Lade was besieged by the Persians, and after a long resistance captured and destroyed in 494 B.C. It seems to have revived after the formation of the Athenian League, and near the close of the Peloponnesian War ventured to revolt and join the Spartans (412 B.C.). It also offered some resistance to Alexander, but seems to have declined from that time, though it continued to exist for several centuries. St. Paul spent two or three days there on his last journey to Jerusalem before his imprisonment at Rome, and delivered his farewell address to the elders from Ephesus, who visited him at his request. (Acts xx. 15–xxi. 1.) Another visit, referred to in 1 Tim. iv. 20, is best placed in a period later than that covered by the Book of Acts. In Roman times the city retained commercial importance, especially under Trajan. In time its four harbors were filled up by deposits made by the Mæander; Lade, once an island protecting the harbors, is now a hill several miles inland. Miletus has a distinguished place in the history of Greek literature, having been the birthplace of the philosophers Thales, Anaximander, and Anaximenes, of the historians Cadmus and Hecataeus, and of the poet Timotheus. Aspasia, wife of Pericles, also was born at Miletus. The site of the city itself is a swampy plain, occupied by the little Turkish village of Palatia. Excavations were begun for the Berlin Academy in 1899, by Th. Wiegand, and in spite of great difficulties have determined the course of the ancient walls, some streets, the Bouleuterion and part of the Agora, and other points important for the topography of the city. A theatre, the largest, perhaps, in Asia Minor, with 54 rows of seats, still rising 100 feet or more, has been uncovered; so, too, a stadium. On the southeast a large temple of Apollo Delphinus, with a central court surrounded by a triple colonnade, was found; in this building, the chief temple of the city, public records were kept. A sacred way, bordered by tombs, led to Didymi. (See BRANCHIDÆ.) Reports of the excavations are published in the *Sitzungsberichte der Akademie der Wissenschaft zu Berlin* for 1900 et seq. Consult also the unfinished work of Rayet and Thomas, *Milet et le Golf Latmique* (Paris, 1877 et seq.); Arnold von Salis, "Die Ausgrabungen in Milet und Didyma," in *Neue Jahrbücher für das klassische Altertum*, vol. xxv (Leipzig, 1910); K. Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern* (2d ed., with map and plan, ib., 1914).

MILETUS, EUBULIDES OF. See EUBULIDES OF MILETUS.

MILETUS, HECATÆUS OF. See HECATÆUS OF MILETUS.

MILETUS, HESYCHIUS OF. See HESYCHIUS OF MILETUS.

MILETUS, TIMOTHEUS OF. See TIMOTHEUS OF MILETUS.

MIL'LEY, JOHN (1813–95). An American Methodist Episcopal theologian. He was born near Hamilton, Butler Co., Ohio; graduated at Augusta College, Kentucky, in 1838; entered the ministry in the same year; and served churches in Ohio and eastern New York from 1838 to 1873, except during 1848–50, when he was teacher in Wesley Female College, Cincinnati. From 1873 till his death he was professor of systematic theology in Drew Theological Seminary. He was a member of the General Conferences of 1864, 1872, 1876, 1888, and 1892, and of the Centennial Methodist Conference of 1884, where he presented a paper entitled "The Work of the Christmas Conference of 1784." In 1886 he was the fraternal delegate to the General Conference of the Methodist Episcopal church, South. He was the author of a *Treatise on Class Meetings* (1851); *The Atonement in Christ* (1879), which advocates the governmental theory; *Systematic Theology* (1892–94). He was a progressive conservative, holding to the substance of the traditional Methodist theology, but introducing important and some even radical changes of view. He was the brother-in-law of Bishop Randolph S. Foster.

MILFOIL. An herb. See ACHILLEA.

MILFORD. A seaport in Pembrokeshire, Wales, on the famous Milford Haven, 6 miles from its entrance and 273 miles west of London by rail (Map: England, A 5). The haven is formed by an estuary running inland for 17 miles to Langwin (easily reached by vessels of 2000 tons), and varies from a mile to two miles in breadth. It is protected from winds by a girdle of hills; its lower reaches are well fortified. The distance of Milford, however, from the Channel, the highway of British commerce, is a serious disadvantage, and its trade is not commensurate with the natural advantages furnished by its excellently protected harbor. The town has passenger and cattle traffic with Irish ports, and an average of 2700 vessels of 575,000 tons' burden enter and clear annually. Area of docks, 60 acres; depth of water over sill (high tide), 34 feet. The proposition to make Milford the eastern terminus of the English transatlantic steamers has been discussed since 1790. It would shorten by several hours the time now necessary for reaching London. It has important and rapidly increasing fish and oyster industries. The United States is represented by a consul. The town owns its water and gas supplies. The haven is frequently mentioned in Shakespeare's *Cymbeline*. Henry VII, when Earl of Richmond, landed here in 1485, on his way to claim the crown. Pop., 1901, 5102; 1911, 6399.

MILFORD. A town in New Haven Co., Conn., 9 miles southwest of New Haven, on Long Island Sound, at the mouth of the Wepowaug River, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 5). It is an attractive summer resort, with fine boating and bathing facilities. Its noteworthy features include the Taylor Library, an interesting Memorial Bridge, erected (1889) on the two hundred and fiftieth anniversary of the town's settlement, a soldiers' monument, and the Broad Street Park of four acres. The leading industries are farming, seed growing, oyster cultivation, wood turning and sawing, and the manufacture of straw hats, gas meters, brass novelties, car furnishings, etc. Pop., 1900, 3783; 1910, 4366; 1920, 10,193.

Milford, called Wepowage by the Indians, was settled in 1639 by a company from New Haven and Wethersfield. In 1644 Milford became one of the six towns which constituted the confederate "Colony of New Haven," and in 1664 it came under the jurisdiction of Connecticut. Robert Treat, an early Colonial Governor, lived in Milford, and here, from 1661 to 1663, the regicides Goffe and Whalley were secreted. Consult "Early Milford," in the *Connecticut Magazine*, vol. v (Hartford, 1899).

MILFORD. A town in Kent and Sussex counties, Del., about 73 miles by rail south of Wilmington on Mispillion River and on the Philadelphia, Baltimore, and Washington Railroad (Map: Delaware, J 3). A steamship line also connects the town with Philadelphia. It is the shipping point for the surrounding agricultural and fruit-growing district and has various industrial interests, including large packing houses and manufactories of dental supplies and lumber products. Milford was founded in 1680 and was incorporated in 1787. The town owns its water works and electric-light plant. Pop., 1900, 2500; 1910, 2603.

MILFORD. A town in Worcester Co., Mass., 18 miles (direct) southeast of Worcester, on the Charles River and on the Boston and Albany and the New York, New Haven, and Hartford railroads (Map: Massachusetts, D 4). It has a fine Federal building, public parks, a splendid system of schools, a public library, and a hospital. The town is the distributing centre for a wide area and is noted as a manufacturing centre, its products including shoes, straw goods, bone cutters, foundry and machine-shop products, looms, rubber goods, etc. There are also extensive quarries of a high grade of granite, which is used in the construction of some of the largest buildings in the country and which is shipped in large quantities. The government is administered by town meetings, which convene at least twice a year. Pop., 1910, 13,055; 1914 (U. S. est.), 13,770; 1920, 13,471. Settled as early as 1669, Milford, with a population of 750, was incorporated as a separate town in 1780, having previously been the East Precinct of Mendon. Consult Ballou, *History of the Town of Milford* (Boston, 1882).

MILFORD. A town in Hillsboro Co., N. H., 11 miles northwest of Nashua, on the Souhegan River and on the Boston and Maine Railroad (Map: New Hampshire, F 8). Milford is one of the largest granite-producing towns in the United States, having 27 firms in that business, and there are also manufactories of furniture, post-office equipment, baskets, celluloid, woolen cloth, towels, ice-cream freezers, and shoes. Ample water power is obtained from the Souhegan. The water works are owned by the municipality. Pop., 1900, 3739; 1910, 3939.

MILHAU, mē'lō'. A town of France. See MILLAU.

MILHAUD, mē'yō', GASTON (1858-). A French philosopher, born at Nîmes. He was at first an assistant professor of mathematics at the University of Montpellier, where he obtained a doctorate in letters in 1894 and became professor of philosophy in the same year. In 1910 he was appointed professor of the history of philosophy at the Sorbonne, Paris. He is author of *Leçons sur les origines de la science grecque* (1893); *Essai sur les conditions et les limites de la certitude logique* (1894; 2d ed., 1898); *Le rationnel* (1898); *Les philosophes-*

géomètres de la Grèce (1900); *Le positivisme* (1902); *Le progrès de l'esprit* (1902); *Études sur la pensée scientifique chez les Grecs et les modernes* (1906); *Nouvelles études sur l'histoire de la pensée scientifique* (1911).

MILIA'RIA (Lat. fem. sing. of *miliarius*, relating to millet, from *milium*, millet). A structural affection of the sweat glands, caused by an obstruction to the sweat secretion and generally accompanied by inflammation. It is classed with the skin diseases.

In *miliaria crystallina*, or *sudamina*, the non-inflammatory form, the lesion consists of minute, pearly vesicles set closely together, but always discrete, generally appearing on the neck, chest, and abdomen, but sometimes in other parts of the body. The vesicles appear rapidly and depart in a few days. Invasions of fresh crops may occur, thus continuing the eruption for weeks. The vesicles are collections of sweat under the superficial layers of the skin.

In *miliaria vesiculosa*, or *rubra*, inflammation occurs in the gland, and the vesicles appear as if raised on a red base. This is the *strophulus*, or *red gum*, of the ancients and is seen principally in children during hot weather and when excessively heavy clothing is worn.

Miliaria papulosa, or *lichen tropicus*, is commonly known as prickly heat. In this variety red, pointed papules are crowded together, with here and there a vesicle or pustule. It is accompanied by excessive sweating and annoying prickling and tingling. It is a tropical disease, of which a milder form is seen in this country.

The treatment of miliaria consists in removing heavy clothing, administering cool baths and saline diuretics, and applying locally soothing and astringent lotions, such as lead water, black wash, dilute vinegar, or powdered camphor mixed with starch or oxide of zinc.

MILIA'RIMUM AUREUM (Lat., golden milestone). A gilded column of bronze near the rostra, towards the west end of the Roman Forum. On it were engraved the distances from the city gates of the main stations and cities on the great roads leading out of Rome. It was set up in 29 B.C. by Augustus as a record of the results of a survey of the Roman domain. Portions of an exquisite marble base, supposed to be the base of the Golden Milestone, were discovered on the spot in 1849. Consult R. A. Lanciani, *The Ruins and Excavations of Ancient Rome* (Boston, 1897).

MILITARY FEVER. See MILIARIA; SWEATING SICKNESS.

MILICEVIČ, mē'lě-chěv'ich, MILAN. See MILITCHEVITCH, DJAKOV MILAN.

MILICZ, mē'lich, or **MILITSCH**, of KREMSIER (c.1325-74). A predecessor of John Huss. He was born at Kremsier, Moravia; entered holy orders and was attached to the court of the Emperor Charles IV; became a canon and later Archdeacon. In 1363 he resigned his appointments, giving himself up to preaching, and was very successful. He went to Rome in 1367 to expound his views as to ecclesiastical abuses, but was thrown into prison by the Inquisition, from which he was released by Pope Urban V on his arrival from Avignon in the autumn of that year. He returned to Prague, where he preached daily with greater success than ever till in 1374 he was summoned before the Papal Court at Avignon, upon complaint as to his orthodoxy, preferred by the clergy of Prague. He obeyed, and the complaint, after investiga-

tion, was dismissed. He died in Avignon on June 29, 1374. Consult Palacky, *Die Vorläufer des Hussitentums* (Prague, 1869), and Lechler, *Johann von Wiclif und die Vorgeschichte der Reformation*, vol. ii (Leipzig, 1873).

MILIN'DA. The Pali form of the name of the Græco-Bactrian King Menander (q.v.). In the literature of the Buddhists his name is important through a book entitled *Milindapañha* or "Questions of Milinda," a work which professes to give an account of a discussion between him and the Buddhist sage Nagasena. It has been translated into English by Davids, *The Questions of King Milinda* (Oxford, 1890-94).

MILIOUKOV, PAUL. See MILYUKOV, PAVEL.

MILITARISM. A term employed somewhat loosely to designate a tendency to subordinate civil to military considerations in the policy of the state. In time of peace the civil power is theoretically supreme: the military power is an instrument to be employed in the execution of civil policies. Practically, however, the constitutional position of the army may be so strong as to give it an important, or even paramount share in the determination of both domestic and foreign policy. This is especially likely to be the case where a nation is surrounded by powerful antagonistic nations. The German Empire presents the best modern instance of militarism, but all the great powers of continental Europe manifest in greater or less degree the characteristics of militarism.

The term is still more loosely used to designate an acceptance of the theory of the inevitableness of warfare, and of the policy of military preparedness. Militarism in this broad sense is the antithesis of pacifism in the narrow sense of a movement towards immediate and absolute disarmament. See IMPERIALISM; INDUSTRIALISM; PEACE MOVEMENT, *International*.

MILITARY ACADEMY, ROYAL. An establishment at Woolwich, England, through which must pass all candidates for the Royal Artillery and the Royal Engineers. See MILITARY EDUCATION.

MILITARY ACADEMY, UNITED STATES. The national institution for the theoretical and practical training of cadets for commissions in the United States army. It is situated at West Point, N. Y., on the west bank of the Hudson, 50 miles from its mouth, amid the picturesque peaks of the Highlands. This place has been occupied as a military post continuously since Jan. 20, 1778. (See WEST POINT for Revolutionary history of the locality and description of the modern post buildings, surroundings, etc.) The Academy itself had its origin in a resolution passed by Congress on Oct. 1, 1776, which appointed a committee to prepare a plan for "a military academy of the army," but the earliest proposal for a military school for the United States was that of General Knox (May, 1776). His plans were seconded by Col. Alexander Hamilton and approved by General Washington. On June 20, 1777, it was ordered that a Corps of Invalids organized as "a military school for young gentlemen previous to their being appointed to marching regiments" be instituted; which order was carried into effect almost immediately. General Washington was untiring in his efforts to establish the Academy, and it was at his request in 1781 that the Corps of Invalids was marched from Philadelphia to join the garrison at West Point, where an

engineer school, a laboratory, and a library had already been established. Two years later Washington again brought the idea of a military academy before his officers at Newburgh, and made a special reference to it in his message of Dec. 3, 1793. On May 9, 1794, his ideas and aspirations were crystallized in a law approved on that date, whereby was authorized the organization of a Corps of Artillerists and Engineers with two "cadets" to each company, and a school of instruction for them was established at West Point in the same year.

The buildings, used as an engineer school, laboratory, and library respectively before 1781, were in 1796 burned down, and thus for a time the work of the Academy was suspended. Instruction was resumed on Sept. 1, 1801, by order of the Secretary of War, who, on July 20 of that year, issued an order directing that all the cadets of the Corps of Artillerists should report at West Point for instruction. The faculty of the Academy at this time was made up of four army officers and a civilian, who acted as administrators and instructors. The actual creation of the Military Academy as it is known today occurred in 1802, under the authorization of an Act of Congress approved on March 16. West Point was selected for its location, and with a class of 10 cadets present it was formally opened on July 4, 1802. The bill authorized the establishment of a Corps of Engineers to consist of 5 persons, a major, 2 first lieutenants, 2 second lieutenants, and 10 cadets, with the pay of \$16 per month. Provision was also made for promotions in the corps, not to exceed 1 colonel, 1 lieutenant, 2 majors, 4 captains, 4 first lieutenants, and 4 second lieutenants; but it was also distinctly ordained that the entire corps should not exceed 20 officers and cadets. The following year an increase of 40 cadets was authorized, and, in 1808, 156 became eligible, but, owing to the lack of provision for them at the Academy, very few of them were enabled to report for instruction.

The Academy passed through many vicissitudes about this time, and in March, 1812, was without a single instructor. Students entered without any mental or physical examination and with little regard to age. The War of 1812, however, called the attention of the government to the pressing needs of the Academy. Only 71 students had been graduated in its first 10 years, and President Madison called the attention of Congress to the necessity of making the Academy a scientific as well as a military college, in consequence of which, on April 29, 1812, the Academy was reorganized upon the principles which underlie its present organization. In 1818 the rules approved by President Monroe went into effect and provided that the assignment of cadets to the different corps in the army and their relative rank must depend upon their general merits, to be determined by a competent board of examiners, and that cadets should not be promoted until after they had received a diploma. Col. Sylvanus Thayer was appointed superintendent of West Point in 1817, and succeeded in making the institution famous among the military schools of the world. In 1815 he was sent by the government to Europe to study military schools, and during the 16 years of his superintendency (1817-33) completely reorganized the curriculum of the United States school. He organized the system of divisions of classes into sections, organized the corps of

cadets into a battalion, and created the position of commandant of cadets. In 1833 he took issue with President Andrew Jackson regarding details of management and resigned his post. In 1838 it was again offered him, together with concessions that gave him almost absolute control, but he declined to accept. From this time on little change has been made in the organization of the Academy other than those natural to the progress of time. Thayer is justly regarded as the Father of the Military Academy; with him began the present era of the Academy's history.

The Civil War (1861-65) brought West Point into considerable prominence throughout the civilized world—so much so that since then its methods have been carefully studied by the experts of nearly every great European country. Every one of the commanding generals on both sides in the Civil War who earned high military honors was a graduate of West Point.

The authorized number of cadets for 1916 is 745, but unless the Law of 1910 making certain increases be reenacted, this number will afterward fall to 571; the number of officers and civilians on duty on Jan. 1, 1915, was 132. The course of instruction is to a large extent mathematical and professional. The curriculum is as follows (September 1-June 4):

First year (fourth class): mathematics, English, history, surveying, drill regulations, gymnasium.

Second year (third class): mathematics, French, drawing, military hygiene, drill regulations, riding, gymnasium.

Third year (second class): natural and experimental philosophy (physics), chemistry, electricity, geology and mineralogy, drawing, drill regulations, Spanish, riding, gymnasium.

Fourth year (first class): civil and military engineering, military, international, and constitutional law, hippology, riding, ordnance and gunnery (with machine-shop practice), Spanish, gymnasium.

The physical training of a cadet is most carefully attended to. Apart from the regular drills and target practice, he learns to swim, ride, box, fence, and wrestle. So far as the limited time will permit, he is allowed to take part in football, baseball, tennis, golf, and track athletics. Polo is compulsory for the first class.

Upon the completion of the course (June 12), cadets who have been two years at the Academy are allowed to go home on a furlough of two months. The remainder go into camp, during which they receive practical instruction in the exercises of the various arms of the service, including practice marches and tactical exercises. In addition, cadets of the third and fourth classes are taught dancing.

The superintendent is assisted by a military staff, and the instruction is given by an academic staff, consisting entirely of army officers, with the additional rank of professors, assistant professors, and instructors of the several departments in which they serve.

In 1902 the requirements for candidates seeking admission were raised. The increased requirements, while making entrance more difficult, greatly assist the student during his period of instruction at the Academy by reducing the amount of work he is called upon to do during his course. Under General Orders, No. 38, War Department, 1914:

"A candidate for admission to the United

States Military Academy from a State, District, or Territory may be excused by the Academic Board from the mental examination for admission upon one of the following conditions:

"1. That he present a properly attested certificate that he is a regularly enrolled student in good standing without condition in any university, college, or technological school accredited by the United States Military Academy, provided that the entrance requirements for the course he is pursuing in such institution require proficiency in subjects amounting to 14 units of the College Entrance Examination Board, which must include mathematics A_1 (algebra to quadratics), A_2 (algebra, quadratics and beyond), and C (plane geometry); English A (reading and practice) and B (study and practice), as outlined by the College Entrance Examination Board. A certificate indicating enrollment at an irregular time or for the specific purpose of obtaining such certificate will not be accepted.

"2. That he present a properly attested certificate of graduation from a preparatory school or public high school which is on the accredited list of one of the institutions referred to above, provided that he is thus certified to have established proficiency in subjects amounting to 14 units of the College Entrance Examination Board, which must include mathematics A_1 , A_2 , and C, and English A and B, as outlined by the College Entrance Examination Board. A certificate indicating graduation at an irregular time for the specific purpose of obtaining such certificate will not be accepted.

"3. That he present a properly attested certificate from the College Entrance Examination Board that he has passed 14 units of its examinations, including mathematics A_1 , A_2 , and C, English A and B, and history A (ancient history) and D (American history and civil government)." After 1915 ancient history will not be required.

The system of training officers at West Point is regarded as more complete than that of any other country; but perhaps the greatest difference is the West Point method of holding the student firmly to his studies during his four years' course.

One feature of the system of instruction at the Military Academy consists in the division of each class into sections of from 7 to 12 cadets each, to each of which sections an instructor is assigned. Each cadet thus recites every day in every subject of his course of study; the result is a hold on his achievement and progress which would be impossible of attainment with larger classes. Transfers to higher or lower sections are continually made; an industrious attentive cadet thus realizes that his work will be recognized by promotion to a higher place in the class. Conversely, a cadet who neglects his studies is sure to "go down." This competition is valuable, because the original rank of graduates among themselves in the army depends on standing at the Academy. At the close of the four years' course, cadets of the highest standing are recommended, in numbers varying from year to year with local conditions, for all the corps of the army; these almost without exception pass into the engineers; then come a few recommended for all branches except the engineers. The remainder are recommended for cavalry, field artillery, coast artillery, and infantry.

The cadet mingles little with the outside world, except in his furlough at the close of two years, so that the four most impressionable years of his life are spent in a training and environment well calculated to produce a thorough soldier. The Academy has been described as a model institution by many distinguished European military authorities, and in the reorganization of the methods of military instruction in England many of the West Point ideas were suggested. The West Point cadet uniform (see UNIFORMS, MILITARY) is the famous cadet gray. The total number of graduates from 1802 to 1914 inclusive is 5347.

MILITARY AÉRONAUTICS. The application to and in the military service, whether ashore or afloat, of any device or apparatus intended (a) to carry passengers and war material from one point to another in the air, for purposes of observation or of destruction or both, and (b) to rise and remain in the air, at an altitude controllable within limits, for purposes of observation. Hence there must be considered, balloons, captive and free; kites (see under KITE; MILITARY OR MAN-RAISING KITE); dirigibles; aéroplanes; and organization and training of air service.

BALLOONS

Captive Balloons. The balloon was first used in war, and by the French, at the battle of Fleurus, June 26, 1794. This balloon, a captive one named the *Entreprenant*, was mounted by Charles Coutelle, and was of material benefit to the French General Jourdan by informing him as to the movements of the enemy. This same balloon was later used in the defense of Maubeuge, and in the sieges of Charleroi and Mayence, 1796.

No balloons were employed during the wars of the Empire. The French sent up one in 1859 before Peschiera; balloons were used during the American Civil War and by the United States troops in Cuba in 1898 before Santiago, where they proved not only a failure in respect of the acquisition of information, but a source of positive danger by giving the Spaniards the exact range. Since the development of the dirigible and the invention of the aéroplane spherical ballooning, whether free or captive, has diminished in interest and value. This is, however, not to say that it has become obsolete. For example, the French army in 1914 made use of *auxiliary* balloons (320 cubic meters) for colonial expeditions; of the so-called *normal* balloons (560 cubic meters), captive, for field service; of *siege* balloons (750 cubic meters) equipped with a ballonnet; and of *ballons de place* (fortress balloons) 980 and 1600 cubic meters respectively,

for free ascensions. All of these are inflated with hydrogen, save the 1600 cubic meter, which uses coal gas.

Spherical balloons are to-day *paneled*; i.e., whereas formerly the seams followed the meridians of the surface, they now in addition are sewed along seams parallel to the equator. This has the effect of limiting a tear, should one develop. Captive balloons are usually made of double vulcanized cloth, and thus do not require varnishing, besides being stronger, more impervious and more durable. To preserve the India rubber from the effects of the sun, balloons are painted with lead chromate, thus producing a characteristic yellow color.

Kite Balloons. The spherical captive balloon is open to some very serious objections: it offers a poor resistance to wind squalls; in a wind of 8 to 12 meters per second observation becomes difficult, and beyond 12 meters impossible. A German officer, Von Parseval, therefore conceived the idea of constructing a balloon which should at the same time be a kite, the so-called *Drachensballon*, or kite balloon. The stability of this balloon would increase as the wind rose and the only limit to its possibilities in this respect would be the strength of the materials used. It consists of a long cylindrical part closed at each end by a spherical cap. At the rear is attached a rudder of toric form, carrying at its

forward end an air-admission funnel and at the other a vent. In the interior of the balloon proper is situated a ballonnet, whose function is to preserve the invariability of form of the system, and into which air is admitted by a funnel and valve. The tail of the kite consists of a series of reversed parachutes opened by the wind. To a sort of belt parallel to the axis of the cylinder are attached, forward, the bridles, which themselves work down to the main retaining cable. No net is used in this type of balloon; the car is suspended from bridles fixed to the rear.

As soon as the balloon is released it orients itself so that its main axis lies in the plane of the wind; this axis, moreover, is so inclined as to, cause the nose of the balloon to lift. The wind now enters the rudder by the admission funnel; the rudder, inflated and assisted by the parachutes, fixes the orientation of the balloon. At the same time air begins to fill the balloon by the funnel, escape being prevented by a check valve. When the interior pressure becomes too great, relief is afforded by the escape of air into the rudder through the ballonnet valve. The filling sleeve is always kept closed. Finally, should the pressure of the gas in the balloon exceed a certain limit, the interior wall of the ballonnet bears upon the envelope of the balloon proper so that the latter pulls a cord communicating with the gas valve and automatically causes the latter to open. All danger of bursting by excess of pressure is thus eliminated. The supporting

effort of the balloon is increased by the effect of the wind on the rectangular lateral wings; these serve further to diminish the inclination of the balloon as the wind rises.

This balloon is the regulation captive balloon of the German and Austrian armies. If we are to believe the French, it is not after all superior to the French siege balloon; it ascends to a lower altitude for the same length of cable unwound; it is difficult to transport and to operate. However, in open country and on good roads, the Parseval even while up in the air can be transported from one point to another of a field, even at a trot. A small balloon (100 cubic meters) of this type has been used in France to carry the antennæ of the field wireless system. It may also serve to carry a photographic camera.

Use of Captive Balloons. Captive balloons may be employed to observe the movements and positions of the enemy and to guide indirect artillery fire. Reports are usually made by telephone. Conventional signals are also employed. In average country an altitude of 500 meters permits a reverse view of deflated positions and, if the weather be clear, of observations as far as 7 kilometers. Before and during a battle an observer in a captive balloon may check the reports of cavalry reconnaissance, pick up reserves, make out field works, etc. During sieges captive balloons might be very useful. At night they may be used for the transmission of luminous signals as far as 30 kilometers. But after all is said and done, their use has always been limited: fog, rain, snow, would prevent observation and they are exceedingly vulnerable to artillery fire; if attacked, the only means of safety is to descend at once as rapidly as possible.

Naturally the possibilities of the captive balloon have led to the organization of balloon service and of balloon troops. As a rule, these troops belong to the Engineers, and are charged with the care, maintenance, and use of the material. Apart from the balloon proper and its equipment, the material includes vehicles for transport, trucks for ascensions, apparatus for generating hydrogen gas, and the necessary supplies, tools, etc., and is usually assembled and kept in balloon parks. These are stationed in the great fortresses, while the general administration, instruction of officers and men is managed by a central establishment. The train accompanying a captive balloon in the field is considerable, including the reel wagon with its tender, a tool wagon, tube wagons carrying compressed hydrogen, and wagons for the balloon equipment proper.

The siege-balloon train is somewhat smaller, but one of its wagons carries photographic equipment.

Free Balloons. Free balloons have no value in military operations save as a means of communication or of escape from besieged places. The Austrians, however, in 1848, made an attempt to use them to bombard Venice, but failed because the wind drove them off. At the siege of Paris, in 1870-71, between September 23 and January 28, 64 free balloons were sent out. These carried out about 2,500,000 letters and 358 carrier pigeons, of which 56 returned to the besieged city. Of the 64 balloons, 2 fell into the sea, 7 into the hands of the enemy, 12 others were captured, but their crews managed to escape.

DIRIGIBLES

The modern dirigible balloon owes its origin to the efforts of two French officers, Renard and Krebs, of the Engineer Corps, who, experimenting in 1884 and 1885, constructed a balloon, *La France*, 50.4 meters long and 8.4 meters in diameter, driven by a propeller actuated by an electric motor. A speed of 6.5 meters per second was attained, and under favorable conditions of wind and weather this balloon made trips, modest to be sure, but significant of greater progress. Since the work of the French officers, as is discussed under AËRONAUTICS, there have been important developments of the dirigible, but all things considered, so far as practical value is concerned, it is almost useless save for military purposes, and even in war its application and possibilities are limited.

Types. Three types of dirigibles are found in the military service. The semirigid and nonrigid are thought to be in many respects greatly superior to the rigid. Their chief advantage consists in the ease with which they can be taken apart and assembled, and in the fact that they can be transported deflated. The keel alone of the semirigid, however, calls for several freight cars, while the Parseval, a nonrigid dirigible, e.g., can be completely loaded on two. On the other hand, if the envelope should be torn, the semirigid and the nonrigid are put out of commission. To the usual classification into rigid, semirigid, and nonrigid some objection has been raised. In the first place the term "semirigid" is in itself improper, inasmuch as the balloon itself is collapsible, but uses a rigid member or frame to connect the car and its accessories with a gas bag. A more rational classification, according to French authorities, from the military point of view, would seem to rest on volume as the determining factor. We thus have:

Vedettes: 2000-4000 cubic meters and taking up three aëronauts. Limited radius of action; to accompany field armies and remain as close as possible to the enemy; easy to handle and to transport; rapidly inflated; no special hangars needed.

Scouts: 6000-7000 cubic meters. Capable of remaining up a considerable time and of going far; of special value when hostile armies are making their approach marches; special hangars needed.

Cruisers: "aërial dreadnoughts," exceeding 10,000 cubic meters; able to go far and remain up a long time, and thus available for strategic reconnaissance; to be concentrated near frontier and ready to start at the first signal; special hangars needed.

But this classification is almost completely robbed of any value by a brief consideration of the requirements a military dirigible must satisfy. In order to be safe from hostile fire a dirigible must rise to a considerable altitude. This altitude is at least 1500 meters, and will increase as balloon artillery improves. Moreover, since it is important that a dirigible shall pass as little time as possible in friendly territory, it must reach this minimum altitude as rapidly as possible and there maintain itself during the greater part of its journey. Hence the condition imposed upon dirigible builders of furnishing a machine that will stay up for a considerable number of hours and remain for at least two-thirds of the time at an altitude of at least 1500 meters. An airship failing to satisfy these

conditions would have very little military value. In order to control rising there must be ballast; if, further, long voyages are contemplated, the supply of ballast must be increased; we thus necessarily arrive at the conclusion that the military dirigible must be of great volume.

The present tendency is towards the construction of the dreadnought class. In illustration of the progress made we may compare the German M I of 1912, of 6000 cubic meters, equipped with two motors of 75 horse power each, developing a speed of 45 kilometers an hour, and having two propellers, with the Z VIII, built in 1914, of 22,000 cubic meters, having three motors of 180 horse power each and four propellers. The Zeppelins actually built on Jan. 1, 1914, with 540 horse power, developed a speed of 77 kilometers an hour. The comparison is still more striking in France. Thus, the Ville de Paris, of 1906, of 3200 cubic meters, speed 43.2 kilometers an hour, developed by one 70-horse-power motor, and with one propeller, is plainly obsolete when compared with Astra XVI, of 23,000 cubic meters and a speed of 90 to 100 kilometers an hour, developed by four 250-horse-power motors actuating four propellers.

So rapid has been the evolution of airship design that dirigibles built before 1910 by the time of the European War which began in 1914 were quite obsolete. In the development of actual type most nations were content to follow models of French or of German origin. In the construction of some of their ships, however, the Italians even before the European War exhibited originality by inclosing the stiffening member or frame in the gas bag itself. This frame is not rigid, but composed of articulated panels, thus accommodating itself to the variations of form of the envelope. The car of the P class (containing dirigibles of smallest volume) is of steel and water-tight, so that in case of need it may float on the surface of the water. In the M class (M = mean, between the smallest class, P, and the largest, G) the car is of steel and completely closed, and thus shelters the crew from wind and weather and at high altitudes. These are real military qualities, for they permit the balloon to go out under unfavorable climatic and weather conditions. In the G class the car forms an integral part of the balloon body. A later type was a crewless dirigible operated by Hertzian waves. These work one propeller forward and two aft, and a fourth, of vertical axis, under the car and thus helping the dirigible to rise. It was said that the trials of this dirigible in July, 1913, turned out very well. We give below, illustrating type, equipment, speed, etc., lists of the war dirigibles of Germany and of France respectively. The latter contains only the airships recognized by the French as having any military value. The tables giving the published state of affairs as it existed early in 1914 just before the war are taken from Rasch and Hornel's *Taschenbuch der Luftflotten* for 1914, though some differences, occasionally quite marked, will be noticed when such information is compared with French authorities.

On Jan. 1, 1914, the military airship (army and navy) fleets of the world were as shown in table at top of page; and to these must be added a certain number of commercial and experimental ships, of which on Jan. 1, 1914, Germany had nine (one building), France two, Italy three, Japan one, Austria two. Germany excepted, none of these has any military value.

There is reason to believe that the number of military dirigibles in existence at the outbreak of the European War was considerably greater than the number published, and during

the progress of the war new dirigibles were built and placed in commission, while others were destroyed. It is reported that L I, L II, L III, L IV, and L VIII have all been destroyed, wrecked, or lost.

Employment of the Dirigible. Dirigibles may be used in two ways: (1) in the acquisition of information; (2) in the infliction of damage upon the enemy. Certain general conditions affect both uses. The dirigible must be equipped with means of communicating with its own side. So long as it remains within the working range of telescopes or field glasses it may use visual signals; when beyond this range it must have recourse to wireless telegraphy. Since a dirigible is liable to attack by other dirigibles or by aeroplanes, it must carry rapid-fire or machine guns to beat off such attacks. By reason of its very nature the dirigible must have a "port" or base, at which are found the hangars for housing the dirigible when not on service, machine and repair shops, gas generators, in short all the apparatus and tools for use and maintenance.

Information. Bearing in mind the constitution of airship fleets, the nature of the duty will depend on the volume of the dirigible. The smaller airships naturally will be useful for tactical reconnaissances, e.g., to report on armies executing their marches of approach; they may conceivably be employed even when armies are in actual hostile contact. The value of such reconnaissance will naturally depend on the rapidity with which the information obtained may be transmitted to the headquarters interested. Obviously wireless telegraphy is here indicated. Communication by this means over a range of 300 miles and more is an accomplished fact. On the actual field of battle accurate information may be sent of the emplacement of the hostile batteries—information of the greatest value and importance—as well as of the general situation of the enemy. This sort of work, however, falls more naturally to the aeroplane, as indeed will probably be found the case with all close work.

Dreadnoughts, the "battleships" and "battle cruisers" of the air, would be used on what is known in the military profession as "strategic reconnaissance," i.e., on long journeys into the heart even of the enemy country, for the purpose of detecting the concentration of troops and the direction of great movements. This function calls for the installation during peace of stations near the frontier, from which without loss of

time dirigibles may proceed into hostile territory. Such stations were found along both sides of the Franco-German frontier, in the great fortified positions, e.g., Metz, Strassburg, Verdun.

Offensive Employment of the Dirigible. Even before the war military authorities expected no great results from bomb throwing and this opinion has been sustained. This must not be understood to mean that such results are impossible or even improbable. With improved apparatus for releasing the bomb or projectile, with more experienced operators, it is possible that success will be attained. It appears to be true that at altitudes safe for the dirigible the expectation of hits is slight; at lower altitudes the dirigible would probably be destroyed before

affairs, so far as made known, and the experience of the European War, that the dirigible has been a disappointment to its partisans. Offensively its performance would seem to have been negligible; whether it achieved in reconnaissance results more tangible is not as yet known.

Defects of the Dirigible. The dirigible is open to some objections, the chief of which may be summed up in one word—bulk. A corollary is its inability to operate by day through fear of hostile aeroplanes. The first cost of a military dirigible of the dreadnought class is great—in the neighborhood of \$500,000. Compared with other items of the military budget, this is not in itself a large sum. But it is large compared with the cost of an aeroplane

achieving any useful purpose. Since the supply of really destructive ammunition that may be carried along is limited, the possibilities of destructive effect are limited. If the attack fail, the journey of the dirigible is worse than useless, and in any case its ammunition once exhausted, it must return to its home port in order to replenish. It is conceivable of course that a government disposing of a fleet of say 25 or 30 dirigibles may send it to hover over an army, or the capital, or a great fortress, over dockyards and arsenals, in the hope of sending down so many projectiles, incendiary and others, that some of them will strike the target. But, as before remarked, if the fleet remain at a safe height, its own fire is uncertain; if it descend so low as to assure a reasonable expectation of hits, it exposes itself to the high angle fire of the defense. It would seem from the state of

—\$12,000 to \$15,000—when it is considered that both machines have similar functions. If a remedy be sought in the construction of smaller dirigibles, we must realize that, although the first cost is much reduced, nevertheless a large sum has been spent to build an instrument whose work can be as well done, if not better done, by a much less expensive machine, the aeroplane. In fact, as the dirigible diminishes in volume its functions tend more and more to coincide with those of the aeroplane. In particular its offensive powers, varying as these do with carrying capacity, tend to disappear, or at least to reach so low a point as to be more than compensated by the superior advantages of the aeroplane, in respect of reconnaissance. Accepting, then, the fact that the dirigible must be of great volume, it is clear that its plant must be of vast size and correspondingly costly. A dirigible in

a fixed shed is a prisoner until the wind is favorable to its issue. The objection is removed, however, by constructing a revolving hangar, such as those built by the Siemens-Schuckert firm in Germany at Biesdorf. This opens at both ends, and may turn 90° either to the right or to the left. It is even proposed to construct subterranean or semisubterranean hangars, into which the ship would be allowed to sink, and then be closed in by a trap-door roof. The cost of these installations would evidently form a serious item in the military budget.

On the outbreak of war the fleet would of

be sheltered, is at the mercy of the wind. But as yet no dirigible has been built which is able to "keep the air," not to say indefinitely, but for a relatively long time, a week or two weeks, without landing. It must return to its own or to some other base or make a landing in order to renew supplies. It is a fact that some dirigibles may remain up 30 hours and longer, and it is certain that this duration allows an ample margin of time for action. But it is also a fact that, from its bulk, the dirigible is vulnerable, far more vulnerable than the aeroplane.

* French war dirigibles were to have their name in large black letters on undersurface of front of balloon, and to carry national colors.

† Previous to war.

course use the stations established during peace on or near the frontier. If these, however, should be destroyed, or if an invasion should be made into the heart of a country, then, if dirigibles are to accompany the army, either a dismountable plant must be provided as a part of the train or the ship must return to a far-distant base. The transportation of such a plant would be a serious matter; the absence of the ship might involve a military disadvantage. The transportable mooring mast of the English army furnishes a sort of solution, but so far as known it is used for only very small models. A dirigible that has landed in the open, if it cannot

The maximum ordinate of the trajectory of the 6.5 centimeter Düsseldorf gun is given as 7900 meters, that of the 10.5 centimeter as 8300 meters. To say nothing of the present impossibility of a dirigible's rising to such a height (the altitude record for dirigibles is 3300 meters) it is clear that long before reaching it its usefulness both in offense and reconnaissance would be very seriously diminished if not completely destroyed. The dirigible is further seriously exposed to aeroplane attack, against which it might prove helpless, unless escorted by its own combat aeroplanes. The value of the dirigible is greatly reduced at night; at useful alti-

4. CURTISS (AMERICAN) MILITARY TRACTOR ARMORED BIPLANE.

tudes its bulk in clear weather should be easily discernible, where an *aéroplane* would be practically invisible. Again, the proper speed of a dirigible must exceed by 4 or 5 meters that of any wind it may have to meet; a speed of 20 meters would allow a dirigible to proceed on 85 days out of 100, one of 12 meters on 40 out of 100. If we diminish these numbers on account of rain, snow, or fog, and take into account gas leakage, it is clear that the usefulness of the dirigible would be still further reduced. Obviously some of the objections cited will lie also against the *aéroplane*, but in a lesser degree, because of lower cost, greater ease of handling, comparative invulnerability, and ability to profit by fleeting opportunities not within the grasp of its bulky rival. Lastly and in general, the dirigible must for the present be regarded as a more or less delicate machine, exposed to danger from fire, e.g., from the blast of its own guns, weather, and the unforeseen causes of disaster.

Advantages of the Dirigible. The dirigible is superior to the *aéroplane* in that it affords a better gun platform, can carry heavier guns, can navigate by night, remain in the air a much longer time, and carry a much greater useful weight. Its wireless equipment has a much longer range. In gun practice some notable results have been attained; e.g., the German Z V at Döberitz early in 1914 made hits on a target 12 by 3 feet at a range of over 1800 yards. In yet other trials a 2-inch gun at an elevation of 2000 feet scored bull's-eyes on a target 30 by 15 feet suspended 1000 feet in the air from a kite balloon; this gun was mounted on top of the gas bag. Z VIII ascended on March 29, 1914, to a height of 10,000 feet, and, as a further example of the possibilities of the dirigible, L III (since reported lost in 1915), after a trip of 35 hours at 62 miles per hour, had enough fuel left for a journey of 16 hours more. This airship carried a searchlight of 40,000 candle power.

AÉROPLANES

That motor flying should have made a special appeal to the military profession was perfectly logical; sporting apart, no real use for flying has so far been imagined comparable with that of the service of reconnaissance in war. In 1909, at the Rheims meeting, the first real tests of *aéroplanes* from a military point of view so impressed the French government that it ordered several Wright machines for military use. It was at this meeting that the Gnome motor first appeared. In 1910 we find the French using *aéroplanes* (and dirigibles) at the fall manœuvres held in Picardy, with results so satisfactory as to lead to the prediction that the whole service of reconnaissance would be revolutionized.

The progress of military flying was still further strikingly displayed at another notable aviation meet held at Rheims in the following year, and at the Paris *Aéroplane Salon*, which marked the close of the *aéronautical* season of 1911. The machines shown indicated that at least an approximate solution had been reached of the various problems of military flying. The engines were more powerful; an improvement had been made in the landing chassis in respect of both strength and simplicity. The single-seat, high-speed monoplane attracted very serious attention; indeed it may be said that this machine

emerged approximately as a distinct and important type. Capable of reaching a speed of 80 miles an hour, it was recognized that a most valuable instrument of reconnaissance had been created, limited, to be sure, in its purpose, but that purpose possibly of the most vital importance.

In the development of military *aéroplanes* France early took and maintained the lead. In 1912 she appropriated nearly \$5,000,000 to military flying, an amount increased by a popular subscription of \$500,000. Germany, wedded to the dirigible, and at first regarding flying as of limited value, nevertheless took alarm after the French manœuvres of 1910, and with characteristic thoroughness set to work to build machines and to develop and train military flyers. In 1912 she appropriated over \$3,000,000 for this element of her war power, and increased the amount to \$10,000,000 in the budget of 1913. Russia followed suit and her *aerial* budget in 1911 was \$5,000,000. Austria, Japan, Italy, and Spain then took up the subject. England was far slower; it was not until 1912 that she gave it serious consideration. What was expended by the combatant nations in connection with the great war is of course only a matter of conjecture until the publication of the detailed budgets. In the meantime it is reported that orders to the value of \$16,000,000 have been placed in the United States by European nations at war, for *aéroplanes* and motors.

Use of the *Aéroplane* in War. Like the dirigible, the *aéroplane* has two functions in warfare—reconnaissance, involving the acquisition and transmission of intelligence, and attack, the infliction of damage upon the *matériel* and *personnel* of the enemy. Of these reconnaissance far outweighs the other in importance and value. The applicability of the *aéroplane* to the business of collecting information has been almost self-demonstrated from the start; its usefulness as an engine of destruction remains on the whole undeveloped. Other uses have suggested themselves during the course of the war. Daily communication between Przemyśl and the Austrian lines seems to have been maintained by *aéroplane*. Russian aviators have been employed to bring up ammunition from the distant rear. These cases, however, are special.

Information. Air craft, i.e., dirigibles and *aéroplanes*, have no effect on strategy, the principles of which are declared to be immutable. But having in view the hugeness of modern armies, preliminary strategical operations must to-day be carefully considered; the strategical plan once adopted, air craft may serve to accelerate the passage to the tactical phases of the situation. This effect can never be great, however, since it is to the interest of any army to reach the tactical phases without loss of time. It is therefore in the domain of tactics that we must seek the influence of air craft. This statement almost shuts us up to a consideration of the *aéroplane* alone. The dirigible conceivably is superior in strategical reconnaissance, because of its ability to keep in the air longer than its winged rival, and especially because it is better adapted to navigate by night; but in tactical reconnaissance, in the observation of troops after they have left the roads, after they have taken up the formations leading to combat, the dirigible must take second place.

In its simplest terms the military problem to be solved by a military aviator consists in

knowing how to get the information wanted and to transmit it to the headquarters interested; hence the military aviator must be able, in full flight, to read a map, must thoroughly understand the three arms, be acquainted with their

carried out by both infantry and cavalry, but chiefly by cavalry. Since each side is doing its best to conceal its own strength and purpose from the other, there results what is called the "fog of war," i.e., the uncertainty as to the im-

* French military aéroplanes, it was announced, should carry on the under side of each wing (lower wing in biplanes) a tricolor cockade one meter in diameter.

formations, and know how to follow a manœuvre.

From the earliest time of mobilization, concentration, and advance of an enemy, each side to obtain information resorts to reconnoissance,

mediate purposes of the enemy and as to the means he employs to carry them out. In spite of all efforts the information brought in to headquarters may be untrustworthy, if only because it may be several hours old before it is received.

Hence it has been the business of military genius, other things equal, to pierce this fog of war and by the proper use of troops to beat the enemy.

The *aéroplane* has almost completely dissipated the fog of war. Long before an army comes up its strength and composition are known, its direction and rate of march disclosed, its purpose revealed. Suitable measures can therefore be taken in ample time, for doubt has given way to certainty, and a commanding general may act in full knowledge of the task before him.

So complete and accurate is the information possible by air scouting that enthusiasts have declared that the reconnaissance duty of cavalry has become obsolete. But to accept this view would be to fall into grave error. With two armies at grips, or about to come to grips, much remains to be done by the intimate, immediate, and local reconnaissance, both of the ground and of the enemy by the troops immediately interested; in other words, the *aéroplane* can never be made to feel the enemy. The *aéroplane* is of inestimable value in giving notice, as already said, of an impending attack, and even of the nature of the attack; the immediate dispositions however, must, as before, be left to the troops themselves.

To form a concrete idea of the service of reconnaissance possible to the *aéroplane*, a machine doing no more than 80 kilometers per hour may fly say 125 kilometers in advance (four days' march) and observe a strip from 8 to 10 kilometers wide. The information brought in, if the machine returns, will be only an hour or two old when received; with wireless, it would represent at the moment the exact military situation. Now this information, if sent in by cavalry patrols, may be 24 or 48 hours old. Moreover, cavalry can never report more than the "apparent contour," whereas the *aéroplane* looks down into the heart of things. It may do admirable service in the transmission of orders and for establishing contact between troops engaged. The opportunity for this presents itself when roads are choked with troops and guns, when telegraph and telephone lines are cut, and wireless ceases to operate.

Some idea of the importance of air service may be formed from the record of over 18,000 hours of flight, and distance of 1,800,000 kilometers by French aviators. The other combatants no doubt can furnish similar records.

Moreover, the *aéroplane* has directly intervened on the battle field itself. Thanks to the increased range and calibre of modern artillery, effects, sometimes surprise effects, are possible at distances undreamed of in elder days. The case may be even more generally stated: so powerful is the modern gun, "whether the classic fieldpiece or the larger calibres brought into action in later years, that distant action may be said to be the rule. But in order to produce results the nature of the target and the range must be exactly known. Now, in obtaining these elements the *aéroplane* is of the greatest value, as appears when we recollect that modern fire is indirect, i.e., the batteries engaged do not see the target. Hence it has been found necessary for the captain of a battery to take his post at some point from which he could observe the fall of the projectiles and so correct his practice. The *aéroplane* to-day enables the battery to see; it indicates targets,

checks and corrects fire. Communication upward, from the commanding officer of the battery with the aviator, is easily established by means of visual signals. Communication downward is effected by dropping written indications suitably weighted within easy reach of the battery. Doubtless improved methods will be adopted in time. See FIELD ARTILLERY.

More generally, the *aéroplane* reveals the extent of the position occupied by the enemy on the field, the number and position of his reserves; from its reports the general may decide whether a turning movement is possible or desirable, when the moment has arrived for a general offensive movement. According to one authority, "it may be and will be offensively used to bombard important points, such as hills, woods, river banks, bridges, etc. *Aéroplanes* equipped for offense will be held in reserve and sent out just before the assault to drop their projectiles upon these points in such volume that no troops could possibly remain in the position." The *aéroplane* may warn its own side of the dangers to which it is exposed from batteries whose presence within range would otherwise be unknown, and thus lead to the adoption of measures either to destroy the batteries or to seek protection from their fire. We cite a few instances from the present war. A single French aviator on Feb. 17, 1915, discovered 21 enemy batteries. Air reconnaissances in the Dardanelles succeeded in locating new gun positions in the forts, a line of surface mines, encampments, and permanent batteries. Aviators flying over the German lines in the La Bassée district picked up six batteries, which a few minutes later were being shelled by the French Artillery (February, 1915). The success of the British Artillery at Neuve Chapelle is in no small measure due to the air service. It has increased the effect of infantry fire; will probably be found of great assistance in coast defense, and lead to increased use of movements by night and to attempted concealment by day.

In reconnoitring the ground from an *aéroplane* telephotography has been found extremely useful. Not only may a terrain otherwise inaccessible thus be forced to reveal its nature, but the results of the reconnaissance are brought in long before an ordinary reconnaissance patrol could have set to work. Military features are presented in their relation to one another; by suitably projecting them upon a map distances may be accurately measured. Other valuable information may also be obtained, such, e.g., as the possibilities of a defensive position or the seriousness of the opposition to be expected at a given point from its physical configuration.

Photographic views may be obtained by the use of the ordinary camera with the telephoto lens, by a motion picture camera which presents a continuous view of the section over which the *aéroplane* or dirigible passes, or by the use of the phototopographic camera, invented by Capt. Scheimpflug of Vienna, Austria, by which a combination of lenses presents an accurate view of an area of 32 square miles if taken from an elevation of 3000 feet or of 126 square miles if taken from an elevation of 6000 feet.

Inasmuch as the *aéroplane* is above all things an instrument of reconnaissance, the question of communication with it, and of receiving information from it, while in flight, is of the first importance. Among all methods tried, obviously wireless telegraphy holds first place.

The installation of wireless on board an *aéroplane* in some respects is notably different from installation at a permanent station. No ground connection for the antennæ is possible, so a second *aërial* or "counterpoise" is employed to replace the ground. In the *aéroplane* two systems exist; in the first, a fine trailing or drop wire, almost a hundred feet long, is used as an antenna, and the counterpoise is formed by the fuselage and metallic parts; in the second, an *aërial* is permanently fixed to the *aéroplane*, and the counterpoise consists of a second antenna similar to the first. The first system is the better in respect of efficiency; but the trailing wire may be caught by objects on the ground in case of sudden descent, or in the propeller itself. This last disadvantage disappears of course in the tractor type of *aéroplane*. The permanent *aërial* set has one serious objection—its small range of communication, not over 10 or 12 miles. In the matter of apparatus the generator and transformer are greatly superior to the induction coil. On account of the noise of the motor it is easier to send messages from an *aéroplane* than to receive them on board. This difficulty however, will very likely be removed by the perfection of a device to shut out to a great extent the noise of the motor and at the same time to increase the strength of the received signals. It should be remembered, too, that it is far more important for an aviator to send than it is to receive.

Other means of communication are visual signals, such, e.g., as the Means smoke telegraph. This is an apparatus emitting long and short puffs of smoke as desired, thus producing visually the dots and dashes of the Morse telegraph code. A similar apparatus tested in France consists of a tube parallel to the main axis of the machine and so placed as to catch the blast of the propeller. To this tube is connected by a suitable valve a reservoir of lamp-black; by opening and shutting the valve long or short puffs may be produced, thus giving the Morse alphabet. Signals are visible at 10 miles. In Germany a lamp using an Edison accumulator has been invented showing green to starboard and red to port for 110 degrees, and white forward and aft. The current may also be used to light up the instruments on board; by introducing a keyboard signals may be made. Other visual methods are flashing lamps by night, between air craft in the air or between them and the ground. On dirigibles the semaphore may be used. Written messages of course may be dropped at prearranged points or where needed; parachutes may be used for this or messages may be merely weighted. A special apparatus for this class of communication is Fugairon's: a hollow cylinder carrying the message is fitted with a mercury-fulminate cap which on landing ignites a charge of Bengal fire and so attracts attention. This signal may be seen by day.

THE AÉROPLANE AS AN ENGINE OF DESTRUCTION

The possibility of using the *aéroplane* to inflict damage upon the enemy has of course been a matter of discussion and experiment. Given a machine able to pass, if not to hover, over an enemy or his arsenals, dockyards, depots, etc., and itself apparently out of harm's way, the idea of using this machine to injure the enemy is alluring. And apparently nothing could be easier than to drop a bomb, whether

explosive or incendiary, upon the target; if the target be large enough, a miss would seem to be impossible. But a little reflection shows that the conditions under which an *aéroplane* must work militate against the success of its offensive effort. It must maintain a certain speed; any error in the evaluation of this speed destroys the accuracy of the fire. In order to be safe itself from hostile fire it must remain at a certain height, and at 1000 meters in the air infantry fire is still to be avoided. Now, the greater the altitude, the less accurate becomes the practice of the *aéroplane*. Moreover, projectiles dropped or launched from great altitudes may encounter air currents wholly different from those in which launched and thus be deflected from the target. This condition is general, defies correction, and is independent of the precision of the instrument used and of the skill of the operator. Its effect increases with the crudeness of the ammunition; i.e., pear-shaped bombs, even spherical projectiles, apart from their inherent inferiority to ogival projectiles, are more likely to be affected by the perturbations of the atmosphere than a projectile designed to stay on its intended trajectory. The uncertainty attendant upon the use of primitive ammunition is so great that we may regard this sort of fire as almost useless. A pear-shaped bomb, dropped or thrown from an *aéroplane* going at speed at a great altitude, will probably miss its target. The conditions laid down, so far, as affecting the precision of bomb dropping, naturally, other things being equal, apply to aimed fire from a suitable gun carried by an *aéroplane*.

Of a different sort is the limitation imposed by the nature of the machine itself—the impossibility of carrying explosives in any serious quantity. But this limitation may prove only temporary. An *aéroplane* able to carry 1000 pounds of explosive is entirely possible, and it is conceivable that a fleet of 20 such machines might do an immense amount of damage, even if only one of four projectiles should find the target. Much would depend upon the nature of the target; e.g., dockyards, dirigible sheds, reserve troops of all arms in mass or in bivouac, especially if surprised—all or any of these might suffer great damage under *aéroplane* attack, where troops intrenched might escape serious injury. If the target is able to defend itself, the *aéroplane's* chances of hitting are still further reduced. As is well known, the accuracy of gun fire from the surface of the ground is checked by observation of the fall of the shots. Such control would be extremely difficult if not impossible for an *aéroplane*. But it would not be impracticable in an attack delivered by an air fleet to cause one machine to expend ammunition in trial shots, under the observation of its companions, and so enable these, on receiving by signal or wireless the data used, to open fire with increased chances of success. And it is obviously always possible for a skillful and daring aviator by a well-placed bomb to destroy a gun, wreck a troop train, or stampede a cavalry regiment. But after all these results would be only local, almost negligible in the sum total of operations.

This is far from saying, however, that the offensive functions of the *aéroplane* may not be so developed as to constitute a valuable factor. British aviators were reported to have done considerable harm to one or two German air-

ship stations, and even to have made two attacks in force, employing fleets of 34 and 40 aéroplanes, upon the German emplacements and depots near Ostend, with the purpose especially of destroying naval equipment and so defeating offensive preparations directed against English shores and commerce. Other examples are the reported (March 4, 1915) destruction of the German powder works at Rottweil, and the raid of 18 aéroplanes, May 27, 1915, on the German chemical factory at Ludwigshafen. Clearly such actions, if successful, would not be local in their results. It must not be forgotten that the subject is still in its infancy, that experience is lacking, even with the War in Europe, and particularly that the service of the aéroplane in reconnaissance has thus far so outweighed its possibilities in offense that these remain as yet undeveloped.

The announcement in 1911 of the Michelin prize for bomb-throwing contests led to some investigations of the problem of launching. P. Charbonnier, president of the Experimental Commission of Havre, published in the *Revue d'Artillerie* for December, 1911, the "Ballistics of the Aéroplane," in which he gave for a spherical projectile the elements of the trajectory *in vacuo* as well as tables of fire for both a vacuum and air. In the same number of the review just cited appeared a description of an aiming device, or sight, to be used by an aéroplane in flight. In the 1912 competition for the Michelin prizes Mr. Riley Scott, an American ex-officer of artillery (U. S. M. A., 1900), won both prizes, the first of 25,000 francs to the competitor who should from a height of 800 meters place out of 15 shots the greatest number of projectiles inside of a rectangle 140 by 20 meters, and the second of 50,000 francs to the competitor who from a height of 200 should place out of a series of 15 shots the greatest number in a circle of 10 meters radius. In the first contest Scott landed 8 out of 15 projectiles; in the second, 12 out of 15. He used an Astra-Wright biplane, at a speed of nearly a mile a minute. This was a very remarkable performance; it established beyond peradventure the fact that projectiles may be successfully launched from an aéroplane in flight with a more than satisfactory expectation of hits.

Scott's apparatus consisted essentially of two parts—the aiming device and the launching mechanism. The aiming device carries a telescope swung in gimbals by means of two concentric rings. In the launching mechanism the projectile rests in a sling one end of which is fixed to a crossbar of the inner ring, the other is held in position by an electromagnet and bolt. On the passage of the current this end of the strap is released and the projectile launched. It is best to discharge projectiles in pairs, as the equilibrium of the aéroplane thus remains unaffected; if desired, however, the apparatus may be so adjusted as to carry and release only one projectile at a time. The projectiles Scott used were ogival, with conical base, from the vertex of which projected a rod with three flanges, resembling the feathers of an arrow, and intended to keep the shot on the trajectory. Scott's apparatus is equally well adapted to the dirigible, but as it is possible for a dirigible to come to a stop in air, a special form of apparatus has also been devised for dropping projectiles vertically downward. This consists of

a set of four tubes, each containing a projectile; the release is made by mechanical means.

Another apparatus (German) for launching bombs was Renaud's. Three discharge tubes, fixed at the vertices of an equilateral triangle, are mounted on a plate and receive the drop-shaped bombs; to these tubes are fitted covers containing a mechanism for holding the bomb in place. Each tube is worked by a pedal set in a board before the operator; by pressing on the proper pedal the corresponding tube is opened; upon disengaging the cover the discharging mechanism proper is set, and a fresh pressure on the pedal releases the bomb. It is claimed for the apparatus that it is safe, light, quickly assembled, and sure of action.

A special (English) projectile was held up by bolts fixed to the aéroplane frame and released by a hand lever. These bolts engage in the projectile in such a fashion as to constitute the safety device of the system; hence on release the projectile is automatically set to explode. The projectile has a tail rudder and carries the percussion apparatus in its nose. An aéroplane bomb developed in England, known as the Martin-Hale, could be hand dropped from an aéroplane or airship or fired from a spring gun. One variety of bomb carrying shrapnel had a total weight of 20 pounds. This includes an explosive charge of four pounds of trinitrotoluol and shrapnel consisting of 340 steel balls. Previous to dropping or firing the bomb the safety pin is withdrawn, and this leaves a tailpiece free to rotate under the action of the wind on the vanes.

Metal darts have appeared as weapons for discharge from the aéroplane. One of these, invented by a Frenchman named Guerre, was an incendiary arrow, 40 centimeters long, 8 centimeters in diameter, and weighing about one kilogram. It contains a reservoir holding about a quarter of a liter of gasoline, which is set on fire by the striking of the point; it is thus intended for the attack on hangars, supply depots, dirigibles, etc. Experiments made with this type seem to have been convincing, for it was reported that the French Minister of War had decided to supply these arrows to aéroplanes. Thanks to a safety device, they can be carried and handled with impunity. Other types are darts pure and simple, about 15 centimeters in diameter, made of steel, cannellured or flanged to keep them from tumbling. Dropped in showers from a considerable height it is conceivable that these darts might prove effective against troops or horses, but at best the results to be expected are aleatory.

The problem of aerial discharge will not be completely solved until certain difficulties inherent in the aéroplane itself shall have been overcome. For example, fuse setting may be a delicate operation aboard an aéroplane in flight. The nature of the fuse itself is an important matter; percussion fuses might be dangerous, especially in the case of a hard landing. One problem has already been solved. Since light projectiles are harmless, aéroplanes of special ascensional power have been built carrying projectiles weighing 100 pounds to 200 pounds and, according to French reports, successfully employed in May, 1915.

Armament of the Aéroplane. The question of arming an aéroplane with a machine or other gun presents itself under a twofold aspect. Material targets being here obviously out of

the question, such a gun would be used (a) against troops, (b) in combat against other air craft.

Against Troops.—No argument is needed to show that an opportunity, however fleeting, may present itself to an aviator to inflict considerable damage upon, e.g., a cavalry regiment, reserve troops in mass, or even upon a line engaged. But, as before remarked, such damage would be local and relatively unimportant. The real question turns on the possibility of so organizing aerial attack that a commanding general could send out a detachment or fleet of aeroplanes, just as he would a regiment or a brigade, to repel an attack or to make one itself. It would be rash to assert that an achievement of this sort were impossible; it is safer to say that unless aerial gunfire can be so organized it cannot be counted upon as a factor in the combat situation.

Combat between Air Craft.—The case is altered when we contemplate combat in the air between opposing aeroplanes and dirigibles. Here we may reasonably arm an aeroplane with a machine gun, such as the Lewis or the Benet-Mercie, in order to beat off or destroy a hostile aeroplane or to attack a dirigible. In fact, bearing in mind the great difficulty of reaching an aeroplane by fire from the surface of the ground, no other reasonably sure method presents itself of resisting a menacing aeroplane than to attack it with a machine of the same nature. To this end it must carry a suitable weapon and must expect to find its adversary similarly armed. A dirigible, to say nothing of the difference of bulk, owing to its slower flight and greater difficulty of manœuvring, would seem to be no match for an aeroplane carrying a machine gun and explosive projectiles. By remaining constantly above the level of the dirigible an aeroplane ought to be able to destroy it by bomb dropping; unless the dirigible itself carried guns upon its upper surface it could make no adequate answer to its smaller and more active antagonist. Apart from bombs, well-directed machine-gun fire delivered in the dirigible dead angles, if any exist, should put the airship out of commission. It is said, however, that the body of the dirigible has little to fear from machine-gun fire using small-arm ammunition. The 37-millimeter Hotchkiss is therefore mounted on some flying machines, and probably would prove effective. A totally different weapon is the Steinmetz "air-craft destroyer." This consists of a bomb at the end of a long wire let down just before the attack, which would consist in flying across and over the air craft to be destroyed, so as to cause the wire to bring up against it. As the flight continued the bomb would come in contact, "hook" itself in, and a suitable mechanism would cause it to explode. This device is recommended for the attack of dirigibles by night, and may even be used against hangars, depots, etc. The Germans, according to press reports, are dropping asphyxiating bombs from aeroplanes.

Upon the general subject of the tactics of air combat we must await the verdict of further experience. One point, however, would seem to be clear: since it is the business of an air scout to observe and report back, it would be his duty to avoid combat, just as a cavalry patrol may receive orders to avoid coming to blows with the enemy. Further, in future wars, aerial

fleets will strive for the "command of the air," as sea fleets now strive for that of the seas. Symbolical of this strife is the air battle, March 21, 1915, between Lörrach and Mülhausen, in which 20 aeroplanes were engaged on both sides. This is regarded as the greatest aerial battle since the beginning of the war.

If an early conclusion from the War in Europe be permissible, it would seem that the offensive effect of an air attack, so far as measured by the known general situation, has, in marked contrast with the reconnaissance effect, been without any specially significant results. Air scouting, in the west at least, soon produced a state of virtual siege between the contending armies. No effect in the least comparable with this apparently can be attributed to air combat. But this conclusion is advanced with hesitation, because official reports later may bring to light instances of air attack of the greatest importance to the combatants concerned, instances perhaps immediately local, but attended with the greatest consequences.

The Attack of Air Craft.—With the development of air craft, whether dirigible or aeroplane, has come the development of weapons for their attack. Obviously the conditions are difficult. The target moves at high speed and the opportunities of aiming and firing are fleeting. The possibility afforded, in firing at a land target, of correcting for subsequent shots by observing the fall of the projectile, does not exist in firing at a target in the air, certainly not to the same degree. All ordinary weapons, the fieldpiece, the howitzer, the rifle, are well-nigh useless against air craft. The fieldpiece cannot be elevated, the howitzer fires (comparatively) slowly and its trajectory is curved. Both lack the facility of turning in azimuth, and the nature of the projectile used by them makes the observation of fire difficult. Rifle fire and machine-gun fire lack range; they might probably inflict no serious damage, even if the target were hit, and observation of results is practically impossible. Hence the necessity of providing special rapid-fire guns for the attack of air craft. These must have an all-around field of fire, be susceptible of elevating to at least 70 degrees, and admit of rapid changes of aim. Special ammunition must be provided, suited to the target and permitting the observation of the projectile during its flight. The fire itself must be carried on in a special manner. Ranging shots being out of the question, the only course is to use sweeping fire, based on the estimated or measured distance.

The calibre of balloon artillery depends on the conditions of service and varies from 3.7 centimeters to 12 centimeters. In a tactical point of view, i.e., to repel or destroy air craft threatening an army, whether by reconnaissance or by attack, great mobility is required. Hence the necessity of automobile mounts.

Various gun makers have addressed themselves to the business of making balloon-attack artillery intended to accompany an army in the field, to be mounted on shipboard and to be emplaced in coast fortifications. The guns manufactured by the Krupps are shown in the accompanying table, taken from Rasch and Hormel's *Taschenbuch der Luftflotten*, 1914.

The Rheinische Metallwaren- und Maschinenfabrik of Düsseldorf constructed 5-centimeter pieces on automobile mounts of two types—fully armored and half armored—besides other cali-

MILITARY AËRONAUTICS

1. BRITISH HYDROPLANE. A Type Developed for the British Navy in the War.
2. GERMAN NAVY CENTRE-FLOAT ALBATROSS SEAPLANE. A Type Used in the War in Co-operation with Zeppelins for Coast Raids and Harassing Shipping.
3. BURGESS-DUNNE SEAPLANE.

MILITARY AÉRONAUTICS

TYPICAL WAR AÉROPLANES MOUNTING MACHINE GUNS

1. BURGESS (AMERICAN) WAR PLANE, mounting Benét-Mercier automatic rifle on swinging crane giving 240 degrees arc of fire.
2. ARMORED DEPERDUSSIN (FRENCH) MONOPLANE, with aéro-mitrailleuse.
3. FRENCH ARMY SPECIAL TYPE ARMORED AÉROPLANE, OR AVION, OF 1914, with Hotchkiss machine gun.
4. FRENCH ARMED AND ARMORED AÉROPLANE. One of the machines assembled in 1914 to defend Paris from attack by Zeppelins. This is a Henri Farman biplane

bres ranging from 6.5 centimeters to 10.5 centimeters. The 6.5 had an automobile mount, as also the 7.5 half armored; another 7.5 had a field carriage, so constructed as to admit of elevation to 70 degrees and of depression to 5 degrees. The 10.5-centimeter had a so-called "firing carriage." At maximum elevation, the 5-centimeter will send their projectiles to a height of 3720 meters, the 6.5 to one of 7900

The smoke shrapnel carries a head filled with smoke composition; this leaves a visible track of smoke from the point of burst on, and to a certain extent thus permits of the correction of fire. The balloon shell carries a detonating charge, and behind this, smoke composition. At 250 meters before the intended point of burst smoke begins to issue and continues the same distance beyond this point. If in the meantime

mount, the Armstrongs one of 15.2 centimeter calibre. The (French) *Deport air-craft* gun can traverse 45 degrees on its carriage. Its trail is divided along its length, and the parts can be moved to the right and left respectively when in action.

The Krupp balloon projectile is a double-chambered shell; the forward chamber carries the bursting charge, the rear chamber a smoke-producing composition. Should a hit be made, a suitable fuse operates to detonate the charge. The smoke composition burns during flight and emits smoke from apertures in the wall of the shell. The flight of the projectile may thus be followed and corrections made. The fuse is extraordinarily sensitive; it must act on meeting the slightest resistance, and yet be safe in the bore of the gun and during flight. The Düsseldorf company already mentioned supplied three types of projectiles for balloon attack—a *brisant* shrapnel, a smoke shrapnel, and a balloon shell. In the first of these a suitable charge drives forward the bullets and the head of the projectile. This head has its own bursting charge, intended to act about 125 meters ahead of the bullets. Should the head strike before bursting, a suitable fuse causes it to burst on impact. While the bullets go forward several hundred meters in a sharp cone of 12 to 14 degrees, the head sends its splinters with great violence, two or three hundred meters up, down, right and left, in a broad cone of 200 degrees.

the shell should have failed to hit, a time fuse is set in operation and produces detonation; should this occur near the target, the flying fragments may hit and cause damage. The possibility of "mining" the air above fortifications against air-craft attack has been suggested. This plan would consist of sending up each evening a large number of small captive balloons to different heights to detonate either by judgment or on contact, each carrying a sufficient quantity of explosive to destroy any *aéroplane* or dirigible with which it might come in contact. These balloons may be supplemented by kites provided with long tails of malleable iron designed to foul the propellers of any air craft.

TYPES OF AÉROPLANE

The division into monoplane and biplane does not of itself furnish a basis of military classification. Furthermore, whatever the basis, machines differ so much from one another in respect of form, size, and materials of construction as for the present to rob classification of any special usefulness. This question of type is not purely academic; apart from the importance of determining what type is best suited to the military service and what modifications it must undergo in order to adapt itself to varying conditions, it is clear that unity of type would greatly simplify repairs and replacements and the instruction and training of aviators. A step in the right direction would be so far as possible to adopt a standard system of control mechanism. So important is unity of type regarded by some authorities that it is asserted that 100 mediocre machines absolutely alike are better (in the military service) than 100 different models, however admirable each may be.

Since the sustaining power of an *aéroplane* varies with the square of its velocity, it is natural and logical that every effort should have been made to increase the velocity of its flight. Under these conditions the pilot's chief duty is to attend to his machine; it is therefore conceivable that his observations may be imperfect or inaccurate. As the *aéroplane* is above all other things an instrument of reconnaissance,

the military machine should therefore in the general case be at least two-seated—should carry an observer and a pilot. Further, since it is in the highest degree desirable if not essential that an observer should transmit his observations to headquarters as rapidly as possible, and without returning to his point of departure, we have to consider the possibility of adding still a third passenger charged with the dispatch of intelligence by wireless telegraphy or otherwise; and if, lastly, the *aéroplane* be offensively equipped, a fourth passenger must be taken on board to serve the gun or other engine of destruction. These conditions point to an *aéroplane* of great sustaining power.

On the other hand, the military situation may call for immediate information of a special character about a particular point. There is no question of destruction or of mapping but of special reconnaissance, e.g., the assistance of cavalry, the detection of hostile batteries, or the control of the fire of one's own batteries. What is needed is a trustworthy report by a trained observer, sent in or brought back with the utmost dispatch. Hence the one-seat machine, light, easily transported, driven preferably by a staff officer attached to headquarters. It may be found that for one class of duties the biplane, for the other the monoplane, is the better suited; but this is a matter to be determined by experience and one that in a military point of view does not necessarily affect the question of type. So far apparently we may recognize the high-speed machine, of small supporting surface, and a slower machine for duty, in which weight, rather than speed, is the feature to be considered; i.e., more specifically, we have the armored monoplane for cavalry and artillery reconnaissance, minimum speed 120 kilometers per hour; the armored biplane for general staff work, minimum speed 100 kilometers per hour; the armored biplane for purely offensive work, minimum speed 120 kilometers per hour; and finally, the large multiple-seated for special service requiring the coöperation of several passengers. In the United States the biplane has been favored for military purposes. As a matter of fact, all sorts of machines were and are found in the *aéroplane* fleets of the great military nations.

The conditions of the field-artillery service seem to require that *aéroplanes* should be permanently attached to this arm. In other words, the artillery feels that it should be emancipated from the necessity of calling upon the commanding general for *aéroplanes* when needed; that it should, on the contrary, possess and control its own machines, to be sent up at once when needed. And just as the needs of the military service call for the special assignment of flying machines, so should these, on account of the special duty they are called upon to perform, satisfy certain conditions.

In France the justice of the demands of the field artillery would seem to have been recognized; the plans for 1915 provided for the assignment of 20 squadrons (*escadrilles*) to assist the artillery. Similarly 10 squadrons were to be attached to the cavalry; provisional squadrons were indeed organized in 1914. A typical fighting biplane is the Vickers, designed for weight carrying and having a speed of 40 to 70 miles per hour. It is of the pusher type, built almost entirely of steel, and carries a small Vickers automatic gun covered in front by a hemispherical shield mounted on the barrel and

moving with it; this shield has mica windows. The muzzle of the gun projects through the nose of the fuselage, which is entirely covered in. The arc of fire forward is 30 degrees on each side of the line of flight. Another English military machine is the "Mark R. E." (reconnaissance—experimental), said to be automatically stable, of the tractor type, and propelled by a four-bladed screw driven by a 120-horse-power Beardmore-Austro-Daimler motor. A French mount is the Loiseau for a Hotchkiss rapid-fire gun, on a support high enough to allow fire over the tractor even with considerable depression. The gun is protected by a 4-millimeter shield in front; although the gunner is partly covered by this arrangement, he is nevertheless seriously exposed. From a purely military point of view this mount is regarded as meeting the objections to the tractor type of *aéroplane*.

Nearly all military *aéroplanes* are of the tractor type, i.e., have the propeller, generally two-bladed, in front. The machine is thus pulled, not pushed, through the air. This special form of mounting is safer for the aviator, who in case of accident falls above the weights rather than under them. It has the disadvantage of limiting the field of fire forward.

The war machine has an inclosed body, or fuselage; this, however, is not necessarily a military feature. The Russian biplane "Russki Wijas" (1913-14) carried a deck house, affording complete shelter to the crew. The armored *aéroplane* was seen during the war in such examples as the French Dorand biplane (1914), the Nieuport monoplane (1914), and the Voisin biplane. The fuselage of the Dorand carried steel armor 2.5 millimeters thick, said to be proof against rifle fire beyond 750 meters, and in many models the armor protection covered the pilot, observer, provisions, instruments, and especially the propelling mechanism. It may be remarked that all machines not aggressive were fitted with wireless. Multiple screws are the exception; the vast majority of *aéroplanes* are single-screwed. One form of the Dorand armored biplane has twin screws, and so have the Nieuport, Dunne, and Savary biplanes; the Russian Sikorski biplane carries four screws in front, driven by four Argus motors of 100 horse power each. This *aéroplane* has a supporting surface of 125 square meters, with a speed of 28.20 meters and a length fore and aft of 20.20 meters—an indication perhaps of the enormous increase in size and power to be expected in the future. If very long, continuous flights are attempted, special tanks are provided for the gasoline carried, as in the Farman biplane (1914), supplied for a 24-hour flight. All *aéroplanes* of course carry instruments; among these are found an inclinometer, to give the angle of incidence of the machine, a clock, an aneroid barometer to measure the height, a speedometer, and a tachometer to give the revolutions per minute of the motor. In addition some good form of compass must be carried, as well as maps in a map case. These instruments, as need hardly be mentioned, are not peculiar to the military machine.

To mark the progress made in the evolution of the military *aéroplane* there follows an extract from the conditions governing the military aviation contest at San Diego, Cal., in October, 1914. The conditions bear date July 1, 1914, and, as before, were fixed by the United States Army Signal Corps.

"The type desired, namely, a military recon-

noissance aéroplane, must possess the following characteristics: biplane, inclosed fuselage, two-seated, dual control, and have a minimum speed of not less than 40 miles per hour when carrying fuel and oil for four hours' flight at 70 miles per hour and a useful load of 450 pounds, and under these conditions of load to climb 4000 feet in 10 minutes. The head resistance is to be kept down by avoiding unnecessary parts exposed to the wind and by using recognized stream lining for those parts necessarily exposed. The power plant is to be located in front of the occupants and suited to the requirements of the aéroplane. The motor must be capable of throttling to 20 per cent of full speed and running without overheating over the land. The motor must be supplied with a positive means of stopping by a short-circuiting device, by release of compression, or by other suitable means. It is desirable that the radiators, if used, should conform to stream-line requirements and act as an effective shelter for the motor. The motor should be provided with positively driven pump for pumping gasoline from the reservoir to the service tank and will also be provided with attachments for hooking on a flexible tachometer, the shaft for this purpose to come off the motor at right angles to the propeller shaft preferably downward. The propeller or propellers should be of sufficient form and construction and suited for the particular machine and possessing a minimum efficiency of 70 per cent, that is to say, to have a slip of not over 30 per cent. Wear and friction in the control leads must be eliminated in every possible way and the leads shall be as direct as possible. Leads to pitching and steering shall be in duplicate. The landing gear to be as strong and simple as possible to be efficient in absorbing shocks in landing and running at full speed over rough and plowed ground. The maximum gliding angle shall under no condition exceed 1 on 6, that is to say, one foot of drop for each six feet of advance. All parts shall be efficiently protected from the action of the weather by the use of suitable paint or furnished with covers. The power plant shall be so arranged as to be readily removed and replaced bodily without disturbing the alignment or the fastenings of the planes or landing gear. The machine complete shall be capable of being assembled from transportation cases in not to exceed two hours by four mechanicians and of being disassembled and packed in transportation cases in not more than one hour and a half by the same number of mechanicians. No part shall be of such length that when packed in its case the case shall exceed 20 feet in length."

Bibliography. In addition to the works listed in the bibliography under AÉRONAUTICS there are available the following official reports and other works the range and number of which constantly are increasing: *Military Aviation*, April 26, 1912 (Washington, 1912); *United States Senate Report 1107*, Jan. 14, 1913 (ib., 1913); Committee on Military Affairs, *Aéronautics in the Army*, House Report, 5304, 1913 (ib., 1913); *Reports of the Chief Signal Officer*, U. S. A., especially 1914, and official reports generally (ib., 1914); R. P. Hearne, *Airships in Peace and War*, being the second edition of *Aërial Warfare* (New York, 1910); Grahame-White and Harper, *The Aéroplane in War* (Philadelphia, 1912); Bertrand, *Etat actuel de l'aéronautique militaire et navale* (Paris, 1913); Faroux and Bonnet (eds.), *Aéro-manuel*, 1914

(ib., annually); Rasch & Hormel (eds.), *Taschenbuch der Luftflotten*, 1914, 1915, the latter a war edition (Munich, annually); Hamel and Turner, *Flying* (London, 1914). All military journals and reviews contain articles on military aëronautics, e.g., the *Revue d'Artillerie* (Paris), *Army and Navy Journal* (New York), *United Service Magazine* (London), *Artilleristische Monatshefte* (Berlin). To give a list would be simply to name here the important military periodicals of the world. The general aëronautical periodical press (see article AÉRONAUTICS) may be profitably consulted. In the technical though nonmilitary press, such as the *Scientific American* (New York), may also be found from time to time articles of value. See AÉRONAUTICS; ARMY ORGANIZATION; MILITARY, OR MAN-RAISING, KITE; NAVAL AÉRONAUTICS; RECONNOISSANCE; SIGNAL CORPS; STRATEGY; TACTICS; WAR IN EUROPE.

MILITARY ARCHITECTURE. The various branches of architecture concerned with the design and construction of buildings for distinctly military purposes. Until the early Middle Ages, military architecture consisted almost entirely of the building of strong walls, towers, and gates around cities and permanent camps. For the engineering of works of defense, see FORTIFICATION.

Egypt. The earliest completely fortified city in good preservation is El Kab in Egypt, which formed a parallelogram of about 1500 by 2000 feet. The walls were of brick, over 30 feet thick and less than 30 feet high, with gates only on two sides. There were no towers, no moats, and the gates were merely openings. Such walls have been found at Thebes, Heliopolis, and in many other cities. Egyptian engineers, however, were sufficiently skillful in the Middle Empire (2000 B.C.) to take advantage of the natural defensive features of rocky situations and to abandon the defective rectangular ground plan; this is evident at Kummeh and Semneh at the Second Cataract, built to protect Egypt from Nubian invasions. Crude brick was the material, projecting buttresses strengthened the walls at intervals, and there were stations where archers could protect the approaches; the wide moat which encircled the fort was defended by a low stone wall; the interior of the fort was filled up solid to the level of a *chemin de ronde*. The Hittite wars made the Egyptians acquainted with the far more advanced systems of western Asia. Towers, bastions, elaborately fortified gates, and the use of stone for brick were some of the results.

Western Asia. The use of crude brick has made impossible any detailed knowledge of the methods of fortification used in Babylonian cities, though they are known to have been protected by walls of immense thickness and height. The plan of placing the Royal Palace on one side and using it as a citadel, of rectangular shape, was followed by the Assyrians, as shown in the city of Sargon, near Nineveh. But it was in the more mountainous countries of western Asia, especially in Syria and Armenia, that the earliest really scientific types of military engineering were thought out. The rectangular type was abandoned in favor of the circular or ovoidal, by which the weak angles were entirely avoided. In place of a single wall with an advance wall or scarp, there were usually three concentric lines of increasing heights, each with towers and battlements and chemins

de ronde. The Hittite cities were the most famous of such fortifications, from which both the Egyptians and Assyrians learned much. The mountainous races of western Asia thus created a type that was long to remain the highest known to military architecture and to be perpetuated by the successors of Alexander, by the Byzantine emperors, and by the Crusaders.

Ægean Peoples. The Pelasgians and other Ægean peoples built also in stone, often with Cyclopean and polygonal masonry. There were many types: first, the groups of defensive forts on the outskirts, or constituting a citadel; then later, the walls encircling the entire city. This wall sometimes rises 60 to 70 feet; the citadel as much more. The walls of Tiryns, with chambers within their thickness, and the Lion Gate at Mycenæ, defended by a narrow passage or *드로μος*, are especially famous.

Greek. The great majority of fortifications found in Greece belong to the prehistoric period just described, e.g., those in Acarnania, at Orchomenus and Phigalia. The advances made in later historic times are shown, e.g., at Mantinea, with two round towers protecting its double gate, and especially at Messene, with gates within large towers having a circular inner court. The towers are battlemented and are sometimes rectangular. Wherever a suitable rugged eminence permitted, a citadel was established, inclosed by walls and difficult of access, as at Athens. See CITADEL.

Roman. The walls of Pompeii, of Aosta, and of Rome are a few among many examples showing the use of a simple encircling wall. The walls of Aurelian around Rome show three tiers of defenses, two lines of embrasures opening on galleries, and the *chemin de ronde* behind the battlements, besides a fourth and higher line at the summit of the numerous square towers. A unique combination of camp, palace, and fortress was Diocletian's palace at Spalato, also a superb work of late Roman architecture, with heavily projecting circular and rectangular towers.

Byzantine. The Eastern Empire continued the traditions of the ancient Orient. Antioch, Edessa, Constantinople, Amida, and other great cities trace their genealogy from Alexander's successors to Justinian. The essay of Procopius on the fortresses of Justinian shows how the Byzantine science of fortification was then being revolutionized under this Oriental influence, as in the great works at Dara. Between the towers permanent *échauguettes* and *machicoulis*, hurdles, or overhanging galleries, were built—originally of wood, but then of stone, in order better to let missiles fall on the besiegers. The system of several concentric walls triumphed permanently over the single rectangular Roman circuit. The citadel was not, as with the Romans, placed in the centre, but in touch with one of the outer walls, so that, if the city were taken, communication could still be maintained between the citadel and the outside world. Their system was adopted throughout the Empire and even in Europe, under Justinian. The walls of Constantinople, though in ruins, still exist—both the land walls and a part of the seaward defenses.

Mohammedan. In the great wars with the Byzantine Empire the Arabs quickly learned the science of military engineering, especially after the titanic struggle with the Macedonian

dynasty in the ninth and tenth centuries. Syria, Mesopotamia, Armenia, and Asia Minor are still covered with the ruins of forts, castles, and fortified cities of this period. The triple-walled citadel of Cairo was erected by architects from Syria. When the Crusaders came to the East, they came into contact with these two forms of Oriental engineering and borrowed its ideas for the West. The golden age of military works in the Orient extended from the ninth to the twelfth century. The combination of citadel and palace, which did not originate in Europe until the fourteenth century, was then a common thing with the emirs of the Mohammedan world; many such castles, of which the Granada Alhambra is an example, are still found in ruins—sumptuously beautiful within, magnificently strong without. The Seven Towers at Constantinople and the two castles of Hissar on the Bosphorus represent the highest development by the Turks of Byzantine models (fifteenth century).

Mediæval Europe. With the barbarian invasions of the fifth and sixth centuries there had been a veritable fury of haste to fortify the cities throughout the Roman world. This was particularly noticeable in Gaul, e.g., at Grenoble and Vienne, and in Spain, as at Cartagena. Mediæval cities often—as at Carcassonne—have their later fortifications based on late Roman or Gothic prototypes. But ordinarily the Roman fortification was a *castrum*, which did not inclose the city. City defense seems to have remained at a higher level than feudal castle architecture until the twelfth century, for while castles long remained mere earthworks in the north of Europe, cities had stone walls and even, as at Piacenza, two concentric circuits; and while the castle keeps were rectangular and in the centre of the circuit, the citadels were often curvilinear and astride the outer walls. For a well-preserved fortified city the best example is Carcassonne in southern France, built during the twelfth and thirteenth centuries. It has an inner and an outer circuit with towers of several shapes, bastions, and barbicans, with a magnificent citadel on the west edge. Avignon, Cologne, Cracow, Aigues-Mortes, Lucerne, Rothenburg, and Nuremberg have more or less complete mediæval fortifications, mostly of somewhat later date.

In the thirteenth and especially the fourteenth and fifteenth centuries in Europe æsthetic beauty was to an eminent degree united with military science in the design of fortress castles. This transformation is exemplified by such structures as Vajda-Hunyad Castle in Hungary, Marienburg in Prussia, and the ducal castle of Milan. The rebuilt castle of Pierrefonds in France carries this conception to its utmost limit. The city gates, as at Lübeck, Cologne, Tangermünde, Stendal, became works of municipal decoration as well as defense. A like combination of art and science was practiced during the Renaissance in Italy: accomplished artist architects like San Michele, San Gallo, and Michelangelo were employed to design fortifications and city gates; e.g., the Porta Nuova, Porta del Palio, etc., at Verona, the Porto del Lido at Venice, the fortifications of San Miniato, etc. After the seventeenth century the work of the architect was more and more severed from that of the engineer. Architecture as distinguished from military engineering at the present day is confined to the designing

of barracks, storehouses, stables, workshops, hospitals, and other buildings required for military purposes but not in themselves defensive. See BARBICAN; BASTION; BASTILLE; CASTLE; CITADEL; DONJON; EMBRASURE; FORTIFICATION; GATEWAY; PORTCULLIS; POSTERN; WALLS; and bibliographies under FORTIFICATION and CASTLE.

MILITARY BAGGAGE. See BAGGAGE, MILITARY.

MILITARY BRIDGES. See BRIDGES AND DOCKS, MILITARY.

MILITARY COMMISSIONS. Special military courts created during the occupation of conquered territory, for the trial of offenses which cannot by the rules of war be tried or punished by courts-martial, and yet which are not within the jurisdiction of any existing court. A military commission, unlike a court-martial, is exclusively a war court. It may be legally convened and assume jurisdiction only in time of war or when the civil authority is suspended on account of the existence of martial law or military government. The powers and procedure of this class of military tribunals have not been defined by statute law nor have they even been expressly authorized by any act of Congress, although they have repeatedly been recognized by the legislative, executive, and judicial departments of the government. According to usage the same rules which apply in the organization and procedures of courts-martial are held to be applicable to military commissions, and their proceedings are subject to review in the same manner and by the same authority as courts-martial. Certain offenses which in time of peace are regarded as civil offenses become in time of war military offenses and are triable by military commission, even though the civil courts may be open and in the unobstructed discharge of their duties. During the Civil War and Reconstruction periods capital offenses were frequently tried by military commissions and the parties punished, although they were in neither the military nor the naval service and in spite of the constitutional provision that all persons held for capital or otherwise infamous crimes, except when arising in the land or naval service, shall be tried by jury. Consult S. V. Benet, *Treatise on Military Law and the Practice of Courts-Martial* (6th ed., New York, 1868), and W. E. Birkhimer, *Military Government and Martial Law* (2d rev. ed., Kansas City, 1905). See COURTS, MILITARY; MILLIGAN, EX PARTE; MILITARY LAW.

MILITARY COURTS. See COURTS, MILITARY.

MILITARY EDUCATION. The education of the modern military officer may be divided into two parts, the preparatory and the technical. The increased demands made upon him in the exercise of his profession entail a most exacting and comprehensive preliminary training—so much so that in many countries candidates for army commissions are trained from earliest youth and molded mentally and physically for their future career. Below is a review of the systems of military education as practiced in Europe and the United States.

In Austria army training for cadets begins between the ages of 14 and 17, there being a number of schools (Realschulen) set apart for that work. Of these the greatest number are for the infantry, then the remainder for artillery, cavalry, and pioneers respectively. On graduation cadets are taken into the army as cadet

officer substitutes (*Cadet-offizier-stellvertreter*) and granted commissions according to seniority, each selecting his own regiment or corps in the branch to which he is assigned—subject to the approval of the officers of such regiment or corps. In addition to these schools there are four military preparatory schools, a military orphanage, and the upper military school, whose pupils, sons of officers without means, enter the academy of Wiener-Neustadt, with its three years' course for cavalry and infantry officers, and the Technical Academy of Vienna, with a similar course for artillery and engineer officers. Pupils unfitted for the courses of these academies go to the cadet schools (Realschulen). Pupils capable of passing the entrance examination of the academies may enter direct. German is the language used in all military educational establishments, the curriculum also being based on the German system. For officers there are at Vienna the war school (staff college) and the superior artillery and engineer schools.

Belgium, previous to the great war, trained the officers of all arms at the Ecole Militaire, Ixelles, the course covering a period of two years for infantry and cavalry and four for artillery and engineers. Entrance is gained by competitive examination, there being an average of 80 vacancies in the school each year.

England possesses two military educational institutions: the Royal Military Academy at Woolwich, which is set apart for Royal Engineers and Royal Artillery cadets; and the Royal Military College at Sandhurst for cavalry and infantry cadets. No one is allowed to compete who has not been passed by the Army Council as socially qualified to hold a commission. The entrance examinations are conducted under the supervision of the Civil Service Commissioners, and there is also a rigid physical examination. The age of admission is from 17 to 19½ years for Sandhurst, and from 16½ to 19½ years for Woolwich, successful candidates paying half-yearly fees, the amount of which varies with the status, official or otherwise, of their families. At Woolwich the period of instruction covers two years and is divided into four classes, of which the fourth is the junior. The third and fourth classes are educated together, but on passing out of the third class into the second, the cadets are separated into two divisions, engineers and artillery, where they remain until graduation. Those passing out of the third class with the best percentage of marks go to the engineers, and the remainder to the artillery. Once the assignment has been made to any particular division a transfer is never allowed. The Royal Military College at Sandhurst is confined to cadets for cavalry and infantry, the entrance examination, fees, and academic terms being similar to the Royal Military Academy. A few cadets are received as royal cadets, or India cadets, who enter without payment and receive a small allowance. They are usually specially favored sons of poor or distinguished officers or have served as court pages. The course of instruction extends over a period of 18 months, divided into three terms, or classes of six months each, known as junior, intermediate, and senior. The peculiarity of the British method of instruction, compared with that of all other countries, is the brief period of instruction in the schools and the very exacting competitive standard and examination for admission, which, as well as the expense

involved at the very outset, limits the class from which cadets are drawn.

Schools of application are the Royal Engineers' at Chatham, the School of Gunnery at Shoeburyness, the Artillery College at Woolwich, the School of Musketry at Hythe, and the Staff College at Camberley. The Army Medical School at Netley trains candidates for appointment in the Royal Army Medical Corps. For schools for rank and file, see ARMY SCHOOLS.

France has two celebrated Cadet schools:

(a) The Polytechnique at Paris, founded in 1794, supplies not only officers of artillery and of engineers, but also officials of the scientific branches of the government, such as roads and bridges, mines, naval construction, etc.; (b) the Ecole Spéciale Militaire, founded in 1808 at Saint-Cyr, and hence popularly called Saint-Cyr, whose graduates enter the cavalry and infantry. Entrance is by competitive examination, and candidates must, on the first of January of the year of examination, be between 17 and 21 years of age. The course lasts two years. Under a law passed in 1905, candidates who have passed must serve one year in the ranks under exactly the same conditions as a private soldier. At the end of this year they enter the schools. This law is due to the democratizing tendencies of the French Republic and, inasmuch as in principle one-half of the officers come from the ranks, rests on the supposed necessity of *unity of origin* for all officers. The artillery school at Fontainebleau has two divisions, one preparing noncommissioned officers of artillery to become officers of that arm, the other of postgraduate studies for lieutenants of artillery. At Versailles are found the same arrangements for the engineers. The school of the train is attached to the artillery school. At Saumur is the postgraduate school for officers of cavalry, as well as a school for noncommissioned officers of cavalry, candidates for commissions. The corresponding school for noncommissioned officers of infantry is situated at Saint-Maixent, but, unlike the other arms, there is no postgraduate school for the infantry.

The Ecole Supérieure de Guerre (Superior War School), or staff college, at Paris receives, after examination, officers of at least five years' service for a thorough course in strategy, tactics, military history and policy, and other subjects relating to the conduct of war. Other schools are those of military administration, of the medical service, etc.

Germany. Officers of the German Army come from the Kriegsschulen (war schools), of which there are 11 in the Empire. All candidates for commissions, whatever their origin, must, after having been appointed *Porte-épée Fähnrich*, be graduated from one of these schools. The *Porte-épée Fähnrich*, in turn, are composed of two classes, *avantageurs* and cadets, and must satisfy certain conditions before being appointed, such as passing the examinations of the Central Board of Officers at Berlin, have served at least five months as private, etc. *Avantageurs* are young men who announce themselves as candidates for commissions; most of the officers come from this class, the remainder from the cadets, who are pupils of the 10 cadet schools. To these schools boys are admitted at 11 years of age; they remain until they are 15, when they are transferred to the *Cadetten Hauptschule* (principal cadet school) at Gross Lichterfelde near Berlin.

The course at the Kriegsschulen lasts 35 weeks and is so adjusted that four classes are graduated in three years. Officers of foot artillery and of pioneers pass to the artillery and engineer schools of application (Berlin and Munich). The Technical War Academy completes the training of officers in mathematics, mechanics, physics, chemistry, and engineering, in the application of these sciences in general, and in their special application to the military service. This academy is open to lieutenants of all arms, and the course lasts three years. There are three riding schools (Hanover, Dresden, and Munich); as the purpose of these schools is the development of equitation and horse training, they are hardly to be regarded as educational in the usual sense of the word.

Finally we have the *Kriegs Akademie*, or General Staff School, at Berlin. The purpose of this school is, through its course of superior military instruction, to disseminate in the army a knowledge of the higher questions of strategy and tactics, and of military policy as an element of national policy. Secondly this school serves to train officers for the staff. There is an entrance examination open to all officers of at least three years' service in a commissioned grade. The professors are drawn as a rule from the officers of the great general staff. There are no examinations, but very careful notes are kept of the progress, capacity, and ability of each student officer. These are sent at the close of the three years' course to the chief of the general staff, who makes them the basis of selection of officers to serve a detail in the great general staff. Munich has a similar academy.

Italy. Military schools in Italy are divided into three classes: (1) the college militari, or preparatory schools; (2) the military academies at Turin for engineers and artillery, and at Modena for infantry and cavalry; (3) *scuole militari complementari* (schools of application). The *Scuola di Guerra*, the school of application for artillery and engineer officers, is at Turin, and the cavalry school is at Pinerola. The courses of instruction at the military academies of Turin and Modena are three years and two years respectively. There is a school for underofficers at Caserta, where approved noncommissioned officers are educated for commission. In each arm of the service fully one-third of the commissions are held by men from the ranks.

Japan. The military academies of Japan compare very favorably with the best in Europe, being in effect organized, as is the army, on the German model. There are establishments devoted to military education under the Minister of War, including the school of military music and the various schools of application. In 1902 several parties of Chinese army officers were sent by their government to undergo a course of instruction at the Japanese Military Academy.

Russia draws most of her officers of cavalry and infantry from cadet (*younker*) schools, of which there are a number in the Empire. Officers not coming from these schools are furnished by the military schools and by the corps of pages. Staff instruction is given at the Nicolas (Staff), technical artillery training at the Michael (artillery), technical engineer training at the Nicolas (engineer) academies respectively, all at Petrograd. The military law and the military medical academies are also situated at Petrograd.

Spain educates her infantry cadets at Toledo, cavalry at Valladolid, engineers at Guadalajara, artillery at Segovia, and administrative at Avila. Suitable academies have been established at these respective places.

United States. Military education in the United States is practically a university system, bringing as it does all the different branches of military education into one system and under the direct control and supervision of a body of specially qualified officers, making every part of the system effective. The United States Military Academy at West Point, N. Y. (see **MILITARY ACADEMY, UNITED STATES**), is the foundation of the entire system and is generally conceded to be unequalled in the thoroughness and comprehensiveness of its training. The practical education of the cadet, in its broadest sense, begins with his assignment to his regiment or corps, there being in addition an officers' school at each military post for elementary instruction in theory and practice. The special service schools or schools of application are: (a) the Coast Artillery School at Fort Monroe, Va., which has a division for enlisted men; (b) the Engineer School, Washington Barracks, D. C.; (c) the Mounted Service School, Fort Riley, Kans.; (d) the Army Medical School, Washington, D. C.; (e) the army service schools at Fort Leavenworth, Kans., comprising (1) the Army School of the Line, (2) the Army Staff College, (3) the Army Signal School, (4) the Army Field Engineer School, (5) the Army Field Service and Correspondence School for Medical Officers; (f) the Army War College (q.v.) at Washington Barracks, D. C. To these may be added the School of Musketry and the School of Fire for Field Artillery, both at Fort Sill, Okla., and the Aviation School at San Diego, Cal. A general supervision of all the different schools enumerated above is exercised by the general staff. Officers' schools at military posts, the army service schools, and the Coast Artillery School are open to National Guard and volunteer officers, as well as to graduates of military schools and colleges which have had regular army officers as instructors. Military education is also furnished by certain State and private schools and by the "Students' Military Instruction Camp." (For other schools, see **ARMY SCHOOLS**.) Information in respect of military schools must usually be sought in official publications. For the United States, consult especially I. L. Reeves, *Military Education in the United States* (Burlington, 1914).

MILITARY FACINGS. See **FACINGS, MILITARY.**

MILITARY FRONTIER. See **FRONTIER, MILITARY; MILITARY GEOGRAPHY.**

MILITARY GEOGRAPHY. Geography is that branch of science which deals with the phenomena of the earth's surface. Military geography considers these phenomena in their relation to or as they influence the practice of the military art in each of its four subdivisions of strategy, tactics, logistics, and military engineering. Although military geography is concerned principally with natural physical features

and resources (physical geography) as modified artificially by man (topography), the statesman and soldier must also study the influence of political, historical, and commercial geography in so far as such influence is felt in national military policies. The knowledge gained from these studies is essential to the formulation of effective strategic plans designed with a view to realizing a particular national policy. The study of the geography and topography of possible theatres of war in the vicinity of political frontiers or boundaries develops a knowledge of military frontiers, i.e., those lines of positions naturally or artificially made strong in a military sense. These lines are usually located near, but are seldom coincident with, political boundaries.

Influence of Geography on Military Operations. In making a general preliminary study of a country with a view to analyzing former campaigns or preparing a plan for future military operations it is advantageous first to consider the great rivers. This has been well expressed and explained by Brigadier General May (*An Introduction to Military Geography*, London, 1909) in the following words: "In studying the military geography of a country we cannot do better than follow up the path of its great watercourses. We are soon in touch with questions of vegetation, of crops, of the distribution of domestic animals, with villages, towns, great cities, fortresses. We reach them by *communications*, and the story of a nation's struggles and growth hinges upon these. For communications govern supply, and supply governs war."

The details of the physical features of the theatre of war must be thoroughly studied beforehand in order to arrive at the character of the troops best suited to that terrain. The means of transportation also is determined by the character of the roads and trails forming the line of communications. In an open plains country with good roads a preponderance of mounted troops and wheeled transportation might be advantageous; in a rough, mountainous country only dismounted troops and mountain artillery, transported on mule back, might be possible. Great howitzers sufficiently mobile on the roads of continental Europe might be useless on American roads. Thus, calibre and power of artillery may be fixed by geography and topography.

The nature and quantity of food, fuel (including petroleum), and forage afforded by the country to be traversed; how the additional amounts required for great modern armies are to be obtained from their own or neutral countries; and by what lines of communication, sea or land, such supplies are to be transported to the main, intermediate, and advance bases—all these are questions of the greatest moment to the responsible statesmen and generals, and they all must be answered, in part, in geographical terms. Thus, physical geography, by giving a knowledge of the resources of all countries, and commercial geography, by affording a familiarity with all the sea lines of communication, are of the utmost value to these national leaders who foresee the inevitable conflicts resulting from national expansion.

Physical geography also treats of weather, climate, and seasons, and these directly affect military operations, both strategic and tactical, as well as questions of supply of food, clothing,

shelter, and transportation. To safeguard the health and comfort of men and animals on tropical service special precautions must be taken. A knowledge of the tropics is essential if proper preparations are to be made. The American campaign of Santiago in 1898 is an illustration of the almost disastrous loss of efficiency due to an inadequate appreciation of the difficulties of tropical service.

The influence of mountains on the strategy and tactics of the attack and defense has many historical instances. Opinions differ as to the relative value of a mountain chain to the offense and to the defense. But the attacker, if he knows his terrain, has the great advantage of being able to select the particular pass to be forced and of concentrating a superiority of numbers at this point before the defender, with difficult lateral communications, can concentrate his troops. The Alps were crossed by Hannibal, Francis I, and Napoleon. The Pyrenees have been crossed frequently by large armies. Alexander in his great march to India led his armies across mountain ranges which would try the skill and endurance of modern soldiers. Jackson in his valley campaign skillfully utilized the mountains as a screen and obstacle to a hostile attack on his flank in his advance paralleling the general trend of the Massanuttons.

Valleys, being the line of least resistance, determine the line of advance, communication, and supply. He who holds the valleys holds the country. Railroads follow the valleys, just as ancient military roads and trails followed the watercourses. It is for this reason that the modern general finds it useful to study the geography of ancient campaigns, the historical routes of barbarian invasion. In going from Constantinople to Vienna the modern traveler to-day passes over the Roman route by way of Adrianople, Philippopolis, Sofia, Belgrade, and Budapest.

Great valleys usually carry great rivers. Rivers may form obstacles, as in the case of mountain ranges, or they may be the principal lines of communication and supply when navigable. They often become the military or strategic frontiers, the defended passages of which form the crucial points during a campaign. Though offering serious difficulties as obstacles, they may be successfully crossed, as are mountain ranges, when the will and skill exist. The Danube, one of the greatest military barriers, has been crossed more than 20 times in the face of defending forces.

A river may guard the flank of an army advancing along its course or may determine the direction of march on account of water supply. Rivers must be studied with reference to strategic points and as a means of supply. The bridges, ferries, fords, roads to each; current, nature and height of banks, floods and ice conditions, must all be considered before military operations are undertaken. Although rivers form natural boundaries and effective military frontiers, it is noticeable in Europe that the expansion and contraction of states in the past has in most cases resulted in the elimination of rivers as political boundaries. Junctions of rivers may form important strategic points or keys, as they control the intersecting valleys and require a besieging army to advance with forces separated by the intersecting rivers.

In planning military operations it is always necessary to study the geography of the theatre

of operations with a view to selecting definite objectives, called strategic points, against which the operations are to be conducted. Such objectives may be political, commercial, or purely military, or all three. The objective, whenever practicable, should be so situated that an advance against it will surely threaten the principal line of communication and supply of the defending army. Examples of such points are important river crossings, mountain passes, railway centres, capitals, water supply, a river port controlling access to the sea and to the interior, etc.

Sea power determines the ultimate eminence of a nation politically, and the development of such power is largely due to geographical location and conditions in relation to the sea. Great Britain's frontier is the sea, and her national existence in peace and war depends on sea trade and sea control. The materials for shipbuilding, coal, and iron are near her great seaports, which control the trade routes through the English Channel to the North and Baltic seas. Similarly, a geographical study of Japan's location and relation to the shores of the Pacific will give an insight into her aspirations and probable future development as the great sea power of the Pacific. For a complete understanding of the political and military history of any country—Germany, Russia, France, Spain, Italy, Holland, the United States—or their present international policies, we must study their geographical location with respect to the sea and the sea routes to other lands.

A knowledge of natural features as modified by man with harbor improvements, wharves, communication to the interior by river, canal, or rail are of utmost importance in planning combined operations of the army and navy. The great interoceanic canals, Panama and Suez, and their approaches introduced new policies and modified strategic plans. The attack and defense of a great seaport like New York involves a knowledge not only of harbor channels, but also (which is far more important) a detailed study of all adjacent landing beaches, tide, surf, prevailing winds, character of beach, lines of advance to the rear of the city and its coast defenses, and the natural positions for interior land fortifications to resist an assault from the rear.

The importance of lines of communication cannot be overestimated. In the words of General May, "Success or failure in war ultimately hinges on communications. That side which can stay the longest—that is to say, which continues to be fed and supplied and reinforced with regularity—will at length emerge victorious. Communications spell strategy, and it is generalship or strategy that wins wars, though it is possible for courage and skill at arms to win battles, or even campaigns."

Above we have touched upon the vital importance of the control of the high seas. On land one of the most striking developments of modern war has been the increased efficiency of railways. During the Russo-Japanese War (1904-05) it was freely predicted that Russia would fail because of the insufficiency and inefficiency of her means of communication by a single line of rail 5000 miles from Moscow. As a matter of fact Russia was able to assemble and maintain at a distance of 5000 miles from her base a force of over 1,000,000 men, a force which was but little less than that of Japan,

who was only six days by sea from her base. Strategic railways are being rapidly constructed not only in continental Europe, but in both Asia and Africa. It was to such railways constructed by Germany in time of peace that she owed her wonderful mobilization on both the western and eastern fronts in the Great European War of 1914. Her six main lines of railway to the French frontier, and those built to the frontiers of Belgium and Luxemburg, double-tracked and equipped with the most modern landing platforms and sidings, joined together by railways paralleling the front along the Rhine, enabled Germany to transport, with great rapidity, vast armies to any part of the French and Belgian frontier and to reinforce any threatened point by troops from any other point. On the Russian side Germany had 17 lines (23 tracks) leading to the frontier, by means of which she was able to dispatch 500 troop trains per day. Against these 17 lines Russia had only five. From Austria eight lines (10 tracks), with a capacity of 260 trains per day, run into the intrenched camps of Galicia, from which an advance into Russia may be made. Against these the Russians have only four lines of railway. Since 1905 the Carpathian Mountains have been pierced by five lines of railway and preparations made to lay three more. To these strategic railways was due the ease with which Germany carried the war into the enemy's territory and placed both France and Russia on the defensive at the very outbreak of the war.

Napoleon once said that "the frontiers of states are either large rivers or chains of mountains or deserts. Of all these obstacles to the march of an army the most difficult to overcome is the desert; mountains come next, and broad rivers occupy the third place." Since his day, however, modern railroad engineering has eliminated the terrors of deserts in Asia, Africa, and America, and thus compelled new policies and new strategic plans of offense and defense.

An article on military geography, no matter how brief, would be incomplete without some reference to buffer states, protectorates, and spheres of influence. Such terms designate the territory of weak states declared inviolate by the mutual agreement of stronger neighbors. Sometimes the purpose is to provide against aggression, sometimes to conceal preparations for aggression. In any case the weaker neutralized state is at the mercy of one or all the stronger. Switzerland, surrounded by France, Germany, Austria, and Italy, is an example of the geographical location of a neutral state influencing the strategy of her neighbors. Belgium, the cockpit of Europe, is an illustration of a buffer state used as the battleground for stronger neighbors. Luxemburg has a similar history. Afghanistan is a true buffer state between the Indian Empire of England and Russia.

The fundamental cause of war is national expansion, which means a forcible rearrangement of international boundaries. A study of the geography of frontiers is therefore most valuable to statesmen responsible for policy as well as to soldiers charged with the execution of policy. For these reasons we find that military geography is largely concerned with the subject of military frontiers—those selected and strengthened lines of defense established in the vicinity of international boundaries as a bulwark against aggressive neighbors. Under modern conditions

of war permanent fortifications constitute a minor part of frontier defense, the main reliance being placed on mobile field armies, for the movement of which in war there have been prepared in peace ample lines of communication leading to the national boundary, and lateral communications, connecting these, parallel to the general front. There is given below as examples a brief geographical outline of a few military frontiers as they existed at the outbreak of the European War in 1914. By reference to a suitable map there will be noted the location of the military frontier, and its rail and other communications, with reference to the international boundary protected.

France. Northern frontier, from Dunkirk to Longwy, 220 miles. Fortified towns: Calais, Gravelines, Dunkirk, Bergues, Lille, Douai, Maubeuge, Mézières, Montmédy, Longwy. Between these are other fortified places, and behind this front a second line: Péronne, Arras, Laon, La Fère. Eastern frontier, from Longwy to Delle, 240 miles. The line of defense extends from Mézières through Verdun, Toul, Epinal to Belfort. Verdun is a fortress of the first class and is on the direct road from Metz to Paris. Between the places given are many minor fortifications. Behind this front is a second line: Rheims, Langres. Still further to the rear is Paris, with its circle of fortifications.

Germany. Here we find a different and more modern principle of defense, noticeably in the absence of fortifications. The Vosges Mountains on the boundary constitute a natural military frontier or obstacle. The only great fortifications are the entrenched camps of Metz and Strassburg. Behind these flows the Rhine, a natural obstacle with guarded passages and a railway on each bank for lateral communication along the front. There is a second line with a few strongholds: Mainz, Coblenz, Cologne, New Breisach, Diedenhofen, Bitsch, and Rastatt. Berlin, unlike Paris, is not defended by great fortifications. Germany's frontier dispositions foretold what the European War of 1914 proved, viz., that the defense of her territory would be accomplished by promptly assuming the initiative and carrying the fight into Belgium and France. On the northeast front there are important fortifications: Danzig, Thorn, Gaudenz, Dirschau. To the northeast of Danzig the strong fortress of Königsberg, with its adjacent strong places at Pillau and Memel, and Boyen near Lötzen. West of Thorn is Bromberg and to the southwest Posen, with strong places. Since the Oder offers an easy advance to Berlin, the fortifications at Glogau have been constructed. Still farther to the south is Neisse.

Bibliography. For other European military frontiers and the geographical reasons for their selection and fortification, consult May, *An Introduction to Military Geography* (London, 1909). On account of the past isolation of the United States with respect to great military powers there is but little published technical literature on the subject of its four great frontiers—the Atlantic, the Pacific, the Canadian, and the Mexican. Expert technical studies have been made by officers of the general staff, but the records of these studies are to be found only among the confidential records of the War College at Washington. However, an interesting geographical military study of the Pacific coast, by a civilian, is to be found in Homer Lea's *Valor of Ignorance* (New York, 1909). A read-

ing of this book will suggest the absorbing interest and great value of geographical studies in relation to general national and military policies.

Macdonnell, *Outlines of Military Geography* (2 vols., London, 1911); United States Army Service School Press, *Moltke's Correspondence* (Fort Leavenworth, Kans., 1911).

MILITARY GOVERNMENT. The administration of territory taken from the enemy which is authorized under martial law (q.v.). It is under this power, arising from the necessity of the case, that provisional governments are instituted in conquered territory. All proceedings of government under martial law are, within the scope of their authority, as legal and constitutional as any other military proceedings. Military government is more properly applied only to governments established in territory outside the boundaries of the state to which the troops establishing it belong. Military rule established in disturbed areas of a state to which the force establishing it belong is more properly to be termed martial law (q.v.).

MILITARY HONORS. Compliments paid to certain officers, officials, or other distinguished persons. See SALUTES; HONORS, MILITARY.

MILITARY HOSPITALS. See HOSPITAL.

MILITARY HYGIENE. See HYGIENE, *Military Hygiene*.

MILITARY INSIGNIA. Devices used to distinguish the various corps, branches, ranks, and grades of the military and naval services. In all the armies of the world it has been found necessary to employ badges and devices to mark the necessary distinctions incident to such organizations. The term "insignia" is here employed to include such badges, devices, etc., in contradistinction to equipment, clothing, etc. The custom in Europe is a natural result of the evolution of the various countries both politically and militantly, and in the case of England particularly the badges, mottoes, and devices used by the various regiments are emblematic of conspicuous incidents in their history and not infrequently have been taken in battle from some regiment of the enemy.

Commencing with the insignia distinguishing the various grades of rank, German usage may be described at length, seeing that its system in a large measure obtains in every other army in Europe. Throughout the Imperial army the epaulets of all commissioned ranks are crescent-shaped. The various grades are distinguished as follows: 1. General field marshal, two batons (staves of command crosswise over each other). 2. General in chief, three stars. 3. General of the infantry, cavalry, or artillery, colonel, captain, two stars. 4. Lieutenant general, lieutenant colonel, first lieutenant, one star; major generals, majors, and second lieutenants do not wear a star. Second and first lieutenants and captain wear epaulets having a gold rim but no trimming; colonels, lieutenant colonels, and majors wear epaulets with gold rims and silver trimming. The general field marshal, general in chief, lieutenant general, and major general are distinguished by the silver rims and silver trimming of the epaulets. The noncommissioned ranks are distinguished by the gold or

silver lace on the collars, cuffs, and facings of the tunics. On the shoulder straps is the number of the soldier and the monogram of his regiment. The various arms of the service are also distinguished by the color of the tunic lace; e.g., infantry regiments have red lace. On the right side of every German soldier's helmet is placed the black, white, and red cockade of the German Empire, while the cockade on the left side indicates the particular state of the German Confederation to which the regiment belongs, as follows: Prussia, black-white; Bavaria, white-sky blue; Hamburg-Bremen-Lubeck, white with red cross; Saxony, white-green, Württemberg, black-red; Baden, yellow-red; Hesse, white-red; Mecklenburg, sky blue-yellow-red; Oldenburg, white-dark blue with red cross; Saxe-Weimar, yellow-green; Brunswick, sky blue-yellow; Anhalt, green; Saxon duchies, green-white; Lippe, yellow-red; Schaumburg-Lippe, white-red; Waldeck, yellow-red; Schwarzburg-Sondershausen, white-dark blue; Schwarzburg-Rudolstadt, dark blue-white; Reuss, yellow-red. Other distinguishing marks between the various services of the German army are found in the color of their uniform, for which see UNIFORMS, MILITARY.

In the British army insignia play an important part. They are used as much to encourage esprit de corps as a mark of distinction between regiments. There is a large degree of variety in the badges in use among the various regiments of the army, most of them reminiscent of stirring periods in regimental history. In 1836 the King commanded that an account should be published concerning the insignia, badges, devices, etc., of the regiments of the army, together with the particulars recounting the reasons for their existence. The result was a very excellent history of the British army. The introduction of the territorial system in 1881 destroyed in a measure the individuality of the regiment and made it a part of the territorial district to which it was assigned. In the effort to bind still further the regiment and its district together the attempt was made by the military administration to abolish many of the insignia formerly characteristic of the different regiments. The attempt, however, created so much opposition and ill will among all ranks of the army that a compromise was effected, and to-day nearly all the old devices are employed, the expense usually being borne by the officers of the regiment. The authorized and unauthorized badges include the royal arms (in the case of the guards and all other regiments distinguished by the prefix "royal"), the whole or part of numerous orders, and other royal honors. Still others are purely regimental, i.e., badges distinguishing regiments of the same arm, as castles, arms of counties and cities, the Prussian eagle, the French eagle, the death's head, the elephant, the antelope, tiger, dragon of Wales, dragon of China, the sphinx of Egypt (this is worn by the 30 regiments who served in the first English expedition against the French in Egypt), the Paschal Lamb, the white horse of Hanover, the white horse of Kent, the lion of England, a gun, a grenade, the bugle (all light infantry and rifle regiments are distinguished by this badge), the bear and ragged staff, the figure of Britannia, St. George and the dragon, the harp and crown, the shamrock (as in the case of the newly formed Irish guards), the Scottish thistle, the Cross of St. Andrew, and many others. The royal arms are borne by the Royal

Engineers and the Royal Artillery, the difference between them being in the mottoes, *Quo Fas et Gloria ducunt* and *Ubique*. With the latter motto is coupled an artillery gun.

As with Germany, the various branches, arms, departments, etc., of the service are distinguished by their distinctive uniforms and not by any particular badge. In the mounted branches rough riders (or young horsemen) are distinguished by a spur worn above the elbow on the sleeve of the tunic; farriers and shoeing smiths wear a horseshoe. Expert swordsmen and gymnasium instructors of all branches wear the crossed swords. Marksmen (sharpshooters) of all arms wear the crossed guns placed immediately above the cuff of the tunic. Pioneers wear the crossed axes on the upper sleeve. Commissioned and noncommissioned ranks of the infantry wear the sash, which in the case of officers is of silk and is worn over the left shoulder, and with noncommissioned officers is of worsted and worn over the right shoulder. Scottish Highland regiments are further distinguished by the differences in pattern of their clan tartans. See UNIFORMS, MILITARY.

In the United States at the time of the Revolution the distinguishing characteristics of army ranks were largely copied after French, Prussian, and English usages. General and staff officers were distinguished by the color of their sash or ribbon, which was worn over the waistcoat and under the coat. Cockades were worn by all other commissioned officers, and the noncommissioned officers were distinguished by the color of their epaulet. On June 18, 1780, a general order was promulgated authorizing the following insignia of rank and grade: major generals to wear two stars on each epaulet; brigadier generals, one star; field officers wore two epaulets; captains, one epaulet on the right shoulder only; lieutenants, one epaulet on the left shoulder. Other distinguishing marks were details of uniform. In 1782 the system of wearing stripes as badges of rank and service by the rank and file was instituted. Changes were frequent up to the Civil War, but the insignia since that time have remained substantially the same, the more important changes, particularly those of 1902, having had to do with uniform and equipment rather than with insignia. Officers' insignia (1914) are as follows:

(a) The letters U. S., of Gothic design, made of gold or gilt metal or dull-finish bronze, worn on the collar of the dress, service, or white coat, are placed at a distance of 1 inch from each end of the collar. When worn upon the dress or white uniform, the letters are of gold or gilt metal (of silver for Engineers). When worn upon the service uniform, they are of dull bronze metal. To designate officers of volunteers these letters are followed by the letter V.

(b) The insignia of corps, department, or arm of service are as follows: General Staff Corps, the United States coat of arms, of gold and enamel, superimposed on a silver star; Adjutant General's Department, a shield 1 inch high, $\frac{3}{4}$ inch wide; Inspector General's Department, gold or gilt sword and fasces crossed and wreathed; Judge-Advocate-General's Department, sword and pen in gold or gilt metal, crossed and wreathed; Quartermaster's Department, sword and key crossed on a wheel, surmounted by a spread eagle of gold or gilt metal, platinum and enamel; Medical Corps, a caduceus of gold or gilt metal; Medical Reserve Corps, same with

letters R. C.; Dental Surgeon, same with letters D. C.; Acting Dental Surgeon, D. S., the caduceus of silver; Corps of Engineers, a silver turreted castle; Ordnance Department, shell and flame, of gold or gilt metal; Signal Corps, two crossed signal flags and a burning torch, in gold and silver; chief of the Bureau of Insular Affairs, seven arrows with wings on sides, 1 inch high, in gold or gilt metal; professors and associate professors of the United States Military Academy, shield and helmet surrounded by a scroll, in gold or gilt metal; aids-de-camp, a device $1\frac{1}{3}$ inches high, consisting of a shield of the United States, of properly colored enamel $\frac{3}{4}$ inch high and $\frac{3}{4}$ inch wide at top, surmounted by a gold or gilt eagle, with wings displayed, on blue field of the shield a star or stars, according to rank of the general on whose staff the officer is serving. This device is worn on the collar in lieu of corps or line device.

The devices appropriate to the various arms of the service are as follows: Cavalry, two crossed sabres, 1 inch high, with number of regiment above intersection; of gold or gilt metal. Field Artillery, two crossed field guns, design to be 1 inch high, of gold or gilt metal, the number of the regiment $\frac{3}{8}$ inch high in the upper angle. Coast Artillery, two crossed cannon, with oval at centre carrying a projectile, point up. Infantry, two crossed rifles, design to be 1 inch high, with number of regiment above intersection; of gold or gilt metal. Regimental adjutants, quartermasters, commissaries, and artillery district adjutants wear in the lower angles of their insignia the devices (of gold or gilt metal) of the respective departments to which their duties correspond; the battalion adjutant and quartermaster of engineer battalions wear the same devices above the centre turret. Chaplains, the same as for regimental staff officers, except that the pendant design is a Latin cross of the same material and size. The insignia of corps, department, or arm of service is placed upon the collar of the dress, service, and white coat $\frac{5}{8}$ inch from the letters U. S. and is of gold or gilt metal with the dress or white uniform and of dull bronze metal with the service uniform. Veterinarian, device of arm of service, with foot of a horse in lower angle, number of regiment in upper angle.

(c) The insignia of rank are placed on the shoulder loops of the service coat and the white coat near the shoulder seam, also on the shoulder knots, as follows: General, coat of arms of United States between two stars; lieutenant general, one large star between two small stars; major general, two silver stars; brigadier general, one silver star; colonel, one silver spread eagle; lieutenant colonel, one silver leaf; major, one gold leaf; captain, two silver bars; first lieutenant, one silver bar.

Sleeve insignia of rank: major general, two silver stars; brigadier general, one silver star; colonel, a single knot composed of five strands of gold-wire lace, not exceeding $\frac{1}{8}$ inch in width, applied to the sleeve of the full-dress coat below the elbow, the base resting on the gold band of the sleeve; lieutenant colonel, four strands, single knot; major, three strands, single knot; captain, two strands, single knot; first lieutenant, one strand, single knot; second lieutenant, without gold lace; chaplain, without gold lace. The outside dimensions of the gold-lace insignia are the same for all officers, the dimensions being made by taking strands from the interior. Metal

insignia of corps, department, arm of service, or aid-de-camp are placed in the centre of the open space under the lace insignia, except for general staff officers, who wear the corps insignia on the shoulder knot.

Sleeve insignia for overcoats, made of flat black mohair soutache braid $\frac{1}{4}$ inch in width, follow the form of the gold-lace insignia for dress coats, but are applied with the base resting at lower end of the sleeve. Insignia of corps, etc., are not worn on the overcoat.

Epaulets: for general officers, of gold with solid crescent, the devices being the coat of arms of the United States embroidered in gold, and one star for brigadier general, two for major general. For general staff officers the insignia of the corps replace the coat of arms of the United States.

Shoulder knots: of gold-wire cord $\frac{1}{4}$ inch in diameter, formed of three cords in four plaits and rounded top, finished with small gilt regulation button; about $5\frac{1}{2}$ inches long and $2\frac{1}{2}$ inches wide, extending from the seam of the sleeve to the seam of the collar; slightly stiffened with a flexible backing which is covered with cloth of the color of the coat and made detachable; insignia of rank to be worn on knot.

Shoulder straps are as follows: general—dark-blue cloth, $1\frac{1}{8}$ inches wide and 4 inches long, bordered with an embroidery of gold $\frac{3}{8}$ inch wide; the field of strap to be of cloth the color of the facings of corps, department, or arm of service; the insignia of rank to be placed in field of strap as follows: general—two silver-embroidered stars of five rays each and gold-embroidered arms of the United States; lieutenant general—three silver stars. Major general—the same as for a lieutenant general, except that there are two stars instead of three; the centre of each star to be 1 inch from the outer edge of the gold embroidery on the ends of the straps; both stars of the same size. Brigadier general—the same as for a major general, except that there is one star instead of two at the centre of the strap. Colonel—the same as for a brigadier general, omitting the star, with a silver-embroidered spread eagle on the centre of the strap. Lieutenant colonel—the same as for a colonel, according to corps, department, or arm of service, omitting the eagle, with a silver-embroidered leaf at each end, each leaf extending $\frac{7}{8}$ inch from the end of the strap. Major—the same as for a lieutenant colonel, with a gold-embroidered leaf at each end, instead of silver leaf; each leaf extending $\frac{7}{8}$ inch from the end of the strap. Captain—the same as for a major, omitting the leaves; at each end two silver-embroidered bars of the same width as the border, placed parallel to the ends of the strap; the distance between them and the border equal to the width of the border. First lieutenant—the same as for a captain; at each end one silver-embroidered bar of the same width as the border, placed parallel to the ends of the strap, at a distance from the border equal to the width of the border. Second lieutenant—the same as for a first lieutenant, omitting the bars. Additional second lieutenant—the same as for a second lieutenant. Chaplain—of dark-blue cloth of the usual size and pattern, with a plain Latin cross of silver in the centre.

Corps badges were first employed during the Civil War and proved to be an extremely valuable means of identification. The devices employed include a triangle (Fourth Army Corps);

the star and crescent (Seventh); a six-pointed star (Eighth); an acorn (Fourteenth); an arrow (Seventeenth); a maltese cross (Nineteenth); a shield (Twenty-third). The device for Wilson's cavalry corps consisted of crossed swords surmounted by a carbine. The Signal Corps was distinguished by the crossed flags and torch. Division headquarters were marked by a square flag upon which was a badge designating the character of the headquarters. The old Twentieth Corps did not at first wear a badge, but when the new Twentieth was formed by the consolidation of the Eleventh and Twelfth Army Corps, it adopted the badge of the Twelfth, a five-pointed star. During the Spanish-American War the various corps were distinguished by the following corps badges: Artillery Corps, crossed conical projectiles, with round shot above the centre; Cavalry Corps, a winged horse's foot; First Corps, the letter I inclosed in a circle; Second Corps, a four-leaf clover; Third Corps, a three-toothed clutch; Fourth Corps, a caltrop; Fifth Corps, a five-bastioned fort; Sixth Corps, a six-spoke hub; Seventh Corps, a seven-pointed star; Eighth Corps, two overlapping circles, very much resembling the figure eight; Ninth Corps, a nine-toothed buzz saw; Tenth Corps, two triangles point to point; Eleventh Corps, same design as for the Tenth Corps, with the addition of a horizontal bar through the centre; Twelfth Corps, a square with a clover leaf at each corner; Thirteenth Corps, a palm leaf; Fourteenth Corps, a square with half circles on each side; Fifteenth Corps, a bugle; Sixteenth Corps, a spearhead; Seventeenth Corps, a battle-ax; Eighteenth Corps, an arch. The color of the symbol determined the division of the corps, as: red, First Division; white, Second Division; blue, Third Division. Such badges were worn on the hat or cap. Commissioned officers wore them on the left breast and not on the hat. See UNIFORMS, MILITARY AND NAVAL; AIGUILLETES; CHEVRONS; ETC.

MILITARY JUSTICE, BUREAU OF. See MILITARY LAW.

MILITARY, or MAN-RAISING, KITE. The man-raising kite as employed for military observation is in principle a "captive" or "anchored" aeroplane (see AERONAUTICS) in equilibrium under the action of three forces, the weight of the apparatus, the pressure of the wind, and the tension of the retaining cable. It is a military possibility because it is easily transported, may be used in a high wind, is quickly sent up, is safe, cheap, and easily repaired. Although of exceedingly limited application, it may yet, under special conditions, be of great value.

The possibility of using a kite for observation purposes is comparatively recent. Various models have appeared from time to time: Mailot's octagonal kite in 1886; Baden-Powell's hexagonal in 1894; Lamson's superposed planes in 1896; diedral kites, etc. But its serious practicability is due chiefly to the invention by Hargrave of the cellular or box kite. This consists essentially of two canvas parallelepipeds, presenting to the wind a double surface, one sustaining, the other directing; in reality it is a canvas beam, open at the ends and cut away in the middle. In the construction of the kite the important condition is to have a maximum sustaining surface and a minimum weight, without sacrificing the strength, the resistance of the system. Hence we have the so-called *density* of

the kite, the ratio of its weight to its bearing surface. Having the box kite then, the true solution of the problem was obtained when the idea of *trains* of kites suggested itself. By the application of this idea not only was the supporting power of the system increased, but its safety also; should one of the trains give way, the others would still hold. Observation from a kite is very convenient and safe; should the wind show signs of falling, the kite is hauled down. A squall even is not to be feared. It is noteworthy that the cable is but slightly influenced by changes of position of the kite in a gusty wind, and remains always stretched in the same direction, that of the prevailing wind. Hence the steadiness of the car, a valuable quality, especially if photographs are to be taken. Moreover, the observer is reasonably safe even under fire, for his stay in the air need be but brief; in other words, he may make his observations and come down before the enemy can get the range.

It is obvious that the possibilities of the man-raising kite are limited; it may, of course, accompany an army in the field, but cannot hope to compete with the dirigible and the aeroplane. Its chief application will be made in observing siege and fortress artillery fire; but even in these cases it will prove inferior to the captive or kite balloon. For one thing, in a given wind a kite will rise to a certain height, which it is useless to endeavor to exceed; any further attempt merely causes the kite to displace itself in the direction of the wind. According to one authority, Captain Sacconey, of the French army, the useful limit of cable payed out is reached when the height of the car is equal to half the length of the cable unwound.

Two countries have made a specialty of the kite: Russia, in its navy chiefly, England in both army and navy. It is said that in England ascensions of 400 meters and even of 800 meters have been made. The results achieved excited attention in France; the outcome of the investigations and experiments was the Sacconey apparatus, of which we shall here give a brief description. In this apparatus two cables are used; to one is attached a train of kites, called the principal train, the purpose of which is merely to raise its cable in the air. On this aerial rail, thus supported, runs a trolley, from which hangs the observation car, carried up by a second train of kites; the car is controlled by the second cable. The two cables are operated by a double winch driven by the motor of the automobile truck that transports the equipment when dismounted. This winch can take up cable at the rate of 180 meters per minute; should the principal train give way, this speed sets up a relative wind, sufficiently great to prevent accidents. The supporting cable is 5 millimeters in diameter, 1500 meters long, and has a resistance of 2000 kilograms; the car cable above the car is 5 millimeters in diameter, with a resistance of 2000 kilograms, and 3.5 millimeters below the car, with a resistance of 1000 kilograms; it is 1300 meters long.

The number of kites to be used obviously depends on the velocity of the wind that may be blowing at the moment. It is assumed that the traction of the cable is constant; this traction corresponds to a lifting effort of 300 kilograms sufficient to support the car, the observer, and the cable. This is always unwound to the same length, and its weight therefore does not change.

The "independent variable" of the problem is consequently the velocity of the wind to be determined by observation; the "dependent variable" is the number of kites. This number is determined as follows: 10 kites of 100 meters' bearing surface will in a wind of 10 miles produce the normal lifting effort of 300 kilograms. This rule is known as the "rule of 10." Modifications of the normal case are assumed to vary with the square of the ratio of wind velocities. Hence a wind of 5 meters per second will support only 75 kilograms, and to raise 300 kilograms, 40 kites will be needed, an impracticable result. A wind of 20 meters per second, on the contrary, would support 1200 kilograms; hence three kites would suffice. The importance of the number of kites appears when we consider that, if the number remained always the same, the stress of the system would be increased ninefold for an increase of the wind velocity from 8 meters per second to 24 meters per second.

The kite used is the Hargrave model, fitted with wings; the car is a wicker basket one meter deep. (See KITE for illustration and description.) In operation two methods of launching the system are followed: the first is known as that of "successive postillions," in which the pilot kite is sent up to say 100 meters, and the others are then successively attached and allowed to run up until they come against the stops, about 6 meters apart; these stops increase in size with the distance, as do the split rings by which each kite is slipped on to the cable. The cable is then paid out. If the wind is strong, the pilot is sent up to its full height, then in succession the remaining kites. In the second method the whole apparatus (with the pilot) is set up on the surface of the ground, ready for launching; at the word of command the pilot is released and takes up the system. The first method requires only a limited space, 30 meters long, the second a space 10 times as long. The complete operation may be carried out in 20 minutes by a crew of some training. Transportation is furnished by an automobile pulling a baggage wagon and carrying besides the crew of 16 men. Apparatus and automobile cost about \$3000, as compared with \$12,000 to \$15,000 for an aeroplane and \$500,000 for a dirigible. Communication is had with the ground either by visual signals or by telephone. For further details, consult *Revue d'Artillerie* (Paris, August, 1912). See KITE; MILITARY AERONAUTICS.

MILITARY LAW. That part of the law of the land which prescribes and enforces the public obligations of persons in the military service. The civil law not being adequate for the government of the military community, peculiar laws and institutions have been framed for its regulation, which invest military authority with the right to punish offenders who are under military rule for offenses contrary to military discipline, or breaches of military duty, the essential object being to maintain order and discipline in the army. Every country that maintains a standing army generally enacts articles for its government and confers special and limited powers upon the military authorities to enable them to enforce their provisions.

The Constitution of the United States confided to Congress the power to keep up a standing army and to make rules and regulations for its government. Under this grant Congress has

enacted Articles of War and other similar enactments which together constitute the statutory military law of the United States. These statutes deal not only with military offenses and punishments, but also with the constitution, composition, jurisdiction, and procedure of military courts. The power of the President to issue regulations and orders to the army is a right incidental to his constitutional power as commander in chief and is a means for carrying into execution his sovereign power. Such orders of the President, as commander in chief, and of superior officers, when not in conflict with existing law and regulations, are also a part of the code military. To declare what the law for the army shall be is the province of Congress; but to interpret this law is a judicial function. While American military law is mostly statutory, we must go to the decisions of the courts and to the opinions of the attorneys-general for interpretation and explanation of the enacted word.

Customs of the Service in peace and in war are a source of military law. These usages have become to the army a kind of common law, supplementing the statute law and regulations. The oath administered to the members of a court-martial requires them in doubtful cases to administer justice according to "the customs of war in like cases." This oath is almost identical with the one taken by members of courts-martial in the British service, and the term "custom of war" as used in the Articles of War of the United States must not be understood as referring only to the usages of the army of the United States.

Persons Subject to the Military Law are (1) officers and soldiers on the active list, whether militia or others, mustered and in pay of the United States, (2) retired officers and soldiers, (3) persons who fraudulently enlist and receive pay and allowances thereunder, (4) discharged officers and soldiers who have defrauded the United States, (5) discharged officers after summary dismissal and general prisoners. In time of war spies, retainers to the camp, persons who relieve and aid the enemy in the way specified in the statutes, are included. When a person subject to military law commits an offense he is placed in arrest or confinement. Except in cases of quarrels, frays, and disorders commanding officers have power only to put officers in arrest. An officer arrested confines himself to his quarters until his arrest is made open or its limits extended. He is not permitted to wear a sword or to visit officially his commanding or superior officer, unless directed to do so. Whenever a commanding officer places an officer in arrest and releases him without preferring charges he makes a written report to the department commander of the cause. When an officer is put in arrest for the purpose of trial, except at remote stations, the officer ordering the arrest must see that he has a copy of the charges on which he is to be tried within eight days after his arrest. Noncommissioned officers and privates to be tried by summary court are generally placed in arrest in their quarters. Privates to be tried by general court-martial are confined in the guardhouse. Confinement without trial as a punishment for an offense is forbidden. Consequent upon arrest follows a preliminary investigation as to the crime or offense charged against the prisoner and the evidence upon which it is to be supported. If the offense is one for trial by a superior court, the charges are forwarded by the

commanding officer with the statement that he has investigated them, and his opinion as to whether or not they can be sustained. When an offense is a minor one a soldier may be given punishment by extra fatigue duty, restriction of privileges, etc., provided he consents to accept such punishment in lieu of trial.

Certain various offenses against military law when committed in time of war are punishable with death. In time of peace the ordinary punishments are dishonorable discharge, confinement at hard labor, and forfeiture of pay. The maximum punishment is given only when the offense is of the worst type or when an example is necessary. In a few instances the punishments are mandatory. The purposes of military process and proceedings in respect to offenses against military law have reference always to the prevention in future of the commission of these offenses. In the military code of England prominence is given to the principle of honor, and as the life of the military community will always depend on the zealous maintenance of this professional characteristic, one of the most important purposes for which the military law exists is to preserve the honor and purity of the service.

American military law began with the War of the Revolution. Articles of war were first made for the government of the army on June 30, 1775. In April, 1806, the present military code was established. This code was derived immediately from the English military laws, and for many years the American officer was compelled to look to English treatises on military law to solve questions which arose in the course of his judicial duties. In 1864 a military law department was established by Congress, to be known as the Bureau of Military Justice. In 1883 this bureau was consolidated with the corps of the judge advocates of the army under the title of Judge Advocates Department, which it still retains. This department as now organized consists of a judge-advocate-general and 12 judge advocates, holding permanent commissions in the department. These judge advocates are stationed in time of peace at the headquarters of the several military departments into which the country is divided. In time of war they are at the headquarters of armies, field armies, and divisions. They are consultative officers and legal advisers. In important trials the direct responsibility of their prosecution is upon them. They receive and revise the proceedings of courts-martial held in their several departments, give legal opinions, and administer oaths. In the English army a judge advocate never acts as a prosecutor or witness for the prosecution. He is a helper to the court, and the prosecutor and the prisoner are entitled to his opinion on any point of law that is relevant to the trial. The judge-advocate-general is a member of Parliament, a Privy Councillor, and a responsible adviser to the crown in all cases of general courts-martial which the crown confirms.

Military law requires that before a sentence of a court can be executed it must be confirmed. In England the sentences of general courts-martial are confirmed by the King or by an officer holding a warrant from the King. In the United States the officer ordering the court or the officer commanding for the time being must approve a sentence before it can be executed. Except in certain convictions in time of war a sentence of death must be confirmed by the President. In time of peace no sentence of a court-martial di-

recting the dismissal of an officer can be executed until approved by the President. It is the duty of a confirming officer to see that the finding and sentence are legal and that the latter does not award a punishment in excess of the punishment authorized by law. Where the sentence of a court-martial imposes several punishments one or more may be approved.

The principal offenses committed by soldiers are desertion, fraudulent enlistment, disobedience to superiors, quitting or sleeping on post, drunkenness, absence without leave, selling or losing by neglect clothing or equipment, and miscellaneous offenses to the prejudice of good order and military discipline. A person in the military service is not freed from his civil obligations. He is still a citizen and amenable to the civil authority for violation of local laws. He is liable to be taxed for his real estate or household goods. He may vote at the place where he has a legal residence.

French Military Law is administered by means of regular trial and sentence before a military tribunal or by infliction by any superior or inferior punishments for mere faults. The punishments inflicted upon officers for faults against discipline are: simple arrests, rigorous arrests, reprimand from the colonel, and prison. Faults of officers too grave for disciplinary punishment are referred to courts of inquest. Councils of war, answering to the American general court-martial, take cognizance of the graver violations of military law, which can only be punished by afflictive or infamous punishments. The judgments of councils of war may be revised by councils of revision. If the latter annul the judgment referred to them, proceedings and decision are sent to a second council of war having jurisdiction in cases of judgments annulled by councils of revision. There is also a court of appeal in cases of trial and sentence for the crime of capitulation. This court is styled the Court of Cassation. Punishments in the German, Austrian, and Russian armies are similar to those in the French service.

English Military Law so nearly resembles the American as to require in this article but brief description. It is embodied in the Army Act of 1881 and is kept in operation from year to year by the passing of the Army Annual Act. It consists of a written and unwritten part. 1. The written part consists of the Army Act, rules of procedure, King's Regulations, general orders, army circulars and orders, royal warrants, and orders in council. 2. The unwritten part consists of the laws or customs of war. The sovereign has power to make articles of war, but the articles of war and the Mutiny Act have been consolidated in the Army Annual Act, and it is doubtful if the necessity for articles of war will ever arise again. The military code of England describes in detail the serious offenses against military law and prescribes the maximum punishment that can be awarded for them.

MILITARY ORDER OF FOREIGN WARS.

See FOREIGN WARS, MILITARY ORDER OF.

MILITARY POLICE. In European countries, the name given to that branch of the police force which has military as well as civil constabulary duties. In these countries the force exists in peace as well as in war. In the United States, in time of peace, there is no regular Federal military police, but they are organized as required during campaigns and during manœuvres simulating war. Selected men for such a force are detached from the army. Their status and duties are defined in the *Field Service Regulations, United States Army* (1914). The duty of military police is to enforce all police regulations in the theatre of operations and in mobilization and concentration camps. They protect the inhabitants of the country from pillage and violence and prevent excesses of all kinds, keep all roads clear, arrest all soldiers and civilian employees absent without proper authority, arrest all marauders, and collect all stragglers and hand them over to their organizations. They keep a list and description of all camp retainers and followers and watch their conduct. They take charge of all prisoners of war. They police all railroad stations, public houses, depots, and public buildings, protect telegraph and telephone lines and railways from damage, keep hostile inhabitants in order, disarm them, and prevent spying. All persons in the military service are required to assist the police when called upon to do so. Officers and enlisted men when actually performing the duty of military police wear a blue brassard on the left arm bearing the letters M. P. in white.

Although there are no Federal military police in the United States in time of peace, the State of Pennsylvania has maintained a State military mounted police force since 1909. It consists of about 300 selected men, many of them with prior service in the regular army, organized into four troops, with officers, under command of a major. The force is composed of experienced men, well paid, mounted, and armed. They guard an area of about 4500 square miles in western Pennsylvania and have proved far more successful than the local police and militia in arresting offenders and in preventing looting, disorder, and crime in time of strikes, floods, fires, and other disasters. In 1915 efforts were being made to secure a similar force for the State of New York.

A noted military police is the Royal Northwest Mounted Police of Canada. This force was organized in 1873 by the Dominion government to preserve law and order in the wilderness northwest of Lake Superior. Before the Great War of 1914 this force consisted of 55 officers and 708 selected men, distributed as follows: Alberta, 290; Saskatchewan, 390; New Manitoba (the northern and sparsely settled part), 22; Northwest Territories, 12; Yukon Territory, 49. In the summer of 1914 the force was increased by 500 men, owing to the fear of possible unrest and disorder among the 175,000 Germans and Austrians settled in the various provinces and districts patrolled by the police.

In the British army, in England, the military police consists of mounted and dismounted branches, with headquarters at Aldershot (q.v.). Their duties are similar to those of the civil police, but are confined to the soldiers of the

district in which they are stationed. In time of peace they are scattered in detachments of varying strength throughout the standing camps and large garrisons of England and Ireland. They are recruited from the regular army and are confined exclusively to noncommissioned officers and men of several years' service and unblemished record. Every member of the force is a noncommissioned officer and acts with the full authority of such. Their uniform is similar to that of the field artillery. In France similar duties are performed by the gendarmerie, a force of military police recruited from the army, but performing civil duties in time of peace. There is a legion in each army corps region, and some regions have more than one legion. The total strength is about 21,700 men, of whom about half are mounted. It is proposed to create a mobile gendarmerie, to deal with strikes and riots, so as to avoid the necessity for calling out troops on such occasions. The Garde Republicaine is also a police force and performs duties in Paris similar to those performed by the gendarmerie in the departments. Its strength is nearly 3000, of which about 800 are mounted. The military police of Germany come into active employment during war time, when each army corps mobilizes two detachments, one to accompany the corps itself and one for the line of communications. In their colonies the Germans, in addition to troops, usually maintain a military native police force officered by Germans. Police forces organized on a semimilitary basis exist throughout the British Empire. The crown colony of Hongkong has a semimilitary police force of 1173 men, of whom 164 are European, 462 Indians, and 547 Chinese. The Royal Irish Constabulary was organized in 1822 and at the present time consists of about 10,000 officers and men. This organization is famous for its efficiency and loyalty during many trying periods of Irish history. Similar bodies were organized throughout Australia, for duty in the gold-mining camps primarily and afterward to control the natives and protect isolated ranches or stations. In organization there is generally a colonel, lieutenant colonel, or major at the head, who is in turn responsible to the Minister of the Interior. Rank and title are the same as in the regular army. In South Africa the South African Mounted Riflemen, established April 1, 1913, are available for military duties whenever required and are included in the military defenses of the colony. The Nyasaland Protectorate (British Central Africa) employs a military police. They are under British officers and are charged with the duties of maintaining order and suppressing the slave traffic. The area under their jurisdiction covers 39,315 square miles and is divided into 14 districts. They also police the eastern portion of the British South Africa Chartered Company's territory, north of the Zambezi, for which they receive payment. British East Africa, besides a military force, has a police of 1735 men under 38 European officers and noncommissioned officers. The Rhodesian military police forces now include all the small bodies of men formerly engaged in the division of what is now termed Rhodesia, the corps as a whole being under the High Commissioner, as are also the forces of the Bechuanaland Protectorate and Basutoland. Similar forces were maintained throughout the German possessions in East and Southwest Africa. See PROVOST MARSHAL.

MILITARY PRISON. By law the government and control of the United States Military Prison is vested, under the Secretary of War, in the Board of Commissioners of the United States Soldiers Home, and the president of that board is required to submit to the Secretary of War annually a statement of the financial and other affairs of the prison. The board consists of the Surgeon-General, the Quartermaster-General, the Chief of Engineers, the Judge-Advocate-General, and the Governor of the Soldiers Home. The immediate administration is in the hands of army officers detailed for that duty by the Secretary of War. The United States Military Prison is divided into three branches: United States Military Prison, Fort Leavenworth, Kans.; Pacific Branch, Alcatraz Island, San Francisco harbor; Atlantic Branch, Fort Jay, Governors Island, N. Y. In addition to these prisons there are guardhouses at military posts in which general prisoners may be temporarily confined. In the United States army there are several classes of prisoners. They are designated as follows: enlisted men against whom charges have been preferred are designated as "awaiting trial"; those tried and prior to promulgation of result as "awaiting result of trial"; those serving sentences of confinement, not involving dishonorable discharge, "garrison prisoners"; officers or men sentenced to dismissal or dishonorable discharge and to terms of confinement at military posts or elsewhere as "general prisoners." So far as practicable general prisoners are kept apart from other prisoners and are the only class confined in the United States Military Prison and branches thereof. Under the law the United States Military Prison is for the confinement and reformation of military offenders against the rules, regulations, and laws for the government of the army of the United States and includes only officers and enlisted men of the army, and of the marine corps when detached for service with the army, who have been sentenced by court-martial to dismissal or dishonorable discharge and confinement. In February, 1912, was inaugurated the modern prison system of separating as far as practicable prisoners convicted of purely military offenses from those convicted of statutory or common-law crimes or misdemeanors. The general prisoners who are under sentence for purely military offenses and whose records and conduct are such as to entitle them to the privilege are now afforded an opportunity to receive a special course in military training. Under orders of the War Department, Sept. 17, 1913, four disciplinary companies were organized at the United States Military Prison, Fort Leavenworth, Kans., and one at Fort Jay, N. Y. Similar companies are to be organized at the Pacific Branch, Alcatraz Island. Bands composed of prisoners are also authorized. Prisoners granted the privilege of membership in the disciplinary companies work during half the day only, the other half being devoted to military drill and training. It is hoped by this system to reform and restore to the service a certain percentage of men now under sentence of dishonorable discharge and of forfeiture of certain rights of citizenship. Under the new plan, since September, 1913, the Judge-Advocate-General of the army has general charge, direction, and control, under the Secretary of War, of these prisons and their administration. The officers of each prison consist of a commandant, an adjutant, a quartermaster, a surgeon, a chaplain, an

executive officer, an exchange officer, an ordnance and signal officer, and such other officers as the War Department may assign. The enlisted men of the army detached for duty as prison guards are organized into companies, to which officers are assigned for the usual company duties. The number of prisoners confined at Fort Leavenworth varies between 900 and 1000; the number at Alcatraz Island, between 300 and 400; at Fort Jay, N. Y., about 100. About 1000 general prisoners are confined at military posts. In addition to the military instruction for the privileged class belonging to the disciplinary companies, the prison system provides schools, libraries, religious instruction, medical attention, and an opportunity to learn a trade.

MILITARY PUNISHMENTS. See MILITARY LAW.

MILITARY RESERVATION, UNITED STATES. A term applied to every military post, station, or other locality selected and set apart for present or future military occupation. Department commanders supervise all such reservations within their territory and are responsible that trespass and damage are prevented. They are also required to see that every consideration is given to their care, preservation, and adornment, and that every available means is employed to make them attractive homes for the army. The grounds are improved so far as possible. Where the reservations are of considerable extent or sufficiently practicable, they are stocked with game, and stringent rules made for the protection of native singing birds. Lands reserved for military use and military posts temporarily evacuated by troops are under charge of the quartermaster's department. Permanent works of defense and lands appurtenant thereto are under the direction and charge of the engineer department.

MILITARY SANITATION. See HYGIENE, *Military Hygiene*.

MILITARY SCHOOLS. See MILITARY EDUCATION; MILITARY ACADEMY, UNITED STATES.

MILITARY SCIENCE. Military science or "the art of war has for its object: first, to determine the time, place, and character of battles and conflicts so that the greatest benefits may result from victory and the least injury from defeat; second, to make one's self stronger than the enemy at the time and place of actual combat. The first of these objects is accomplished by strategy, including logistics; the second by logistics, discipline, grand and minor tactics, and military engineering. None of these branches can be practiced, or even intelligently studied separately; nor can one be rated as of higher value than the others, since ultimate success must depend upon them all. The highest strategy accomplishes nothing unless the logistic and tactical requirements for success in battle are satisfied. The best tactical arrangements and actions may result in victories entirely barren, even sometimes worse than defeat, owing to faulty strategical dispositions; while a failure in logistics will, of necessity, destroy all strategical and tactical combinations.

"To show more clearly the relations of these subdivisions to the objects of the art of war, it is only necessary to call attention to the fact that whether or not the 'greatest benefit will result from victory and the least injury from defeat' will depend upon the positions of the opposing armies with reference to each other's communications, lines of retreat, and objectives,

before and after conflicts, the moral and political effects produced by the results of battles, and the times of their occurrence. These considerations evidently involve questions of strategy, including statesmanship, both in planning campaigns and forecasting their results; and logistics, in preparing for the execution of the plans. The second object will be accomplished to a greater or less degree: first, by rapidity of concentration, giving a greater number of men at the place of actual conflict. Second, by better arms, ammunition, and supplies, better defensive arrangements, better training and discipline, or better handling of the masses or small groups, making the same, or a less, number of men stronger than the hostile force. Third, by localizing the conflict upon a point where this superiority exists. The first is a question of logistics; the second of logistics, engineering, discipline, and grand or minor tactics; and the third of grand or minor tactics, depending upon the force engaged.

"Tactics may be defined generally as the art of so handling bodies of troops, large or small, as to utilize to the fullest extent the fighting, manœuvring, and resisting capacity of every individual, weapon, and resource of all arms of the service. When applied to the combined action of large masses, made up of different arms, it is called grand tactics. When restricted to the actions of small bodies, or single arms, it is called minor tactics. This division is general and not well defined, since the two run imperceptibly into each other.

"Logistics embraces all the details of moving and supplying armies. It is essentially the province of the staff, and its different branches are apportioned to the different staff departments.

"Strategy has for its object so to inaugurate and conduct wars, campaigns, and battles as, first, to take advantage of all available means for securing success; and, second, to cause the greatest benefits to result from victory and the least injury from defeat. . . . Under the first heading it involves questions of statesmanship and diplomacy. . . . Under the second it is more frequently concerned in the moral effect to be produced by a battle, resulting, in case of victory, from the absolute losses inflicted upon the enemy or the disadvantageous positions in which he may be placed with respect to his bases of supply and lines of communications; and, in case of defeat, from the corresponding losses of our own army." (*Elements of the Art of War*, by James Mercur, Colonel, U. S. A., professor of civil and military engineering at the United States Military Academy, West Point, N. Y.)

Military engineering includes the technical work connected with the construction of permanent and field fortifications, including siege works, reconnaissance, constructing and dismantling bridges, military roads and trails, the construction, operation, and maintenance of railroads in the theatre of operations under military auspices and for military purposes, the transportation of engineering equipment such as reconnaissance instruments, the light and heavy bridge trains, intrenching tools, etc. Consult *Engineer Field Manual, United States Army*.

Logistics falls under the general head administration, as distinguished from organization and operations. The details of moving and supplying armies, or logistics, come under two very general classes of activities: the service of the interior and the service of the theatre of opera-

tions. The service of the interior is carried on by department (territorial) commanders and bureau chiefs having for this purpose general depots of supply, general hospitals, arsenals, etc. The service of the theatre of operations is carried on by the commander of the field forces and is divided into two zones: (a) the zone of the line of communications, (b) the zone of the advance. The function of the service of the interior is to supply the commander of the field forces with the means necessary for the accomplishment of his mission, i.e., to concentrate such means at the principal base of the field forces. From this principal base up to and including the advance bases in rear of the fighting divisions extends the line of communications, the commander of which is responsible to the field commander for its efficient operation and defense. From the advance bases to the fighting units is the zone of the advance, within which operate the division combat, field, ammunition, supply, sanitary, and engineer trains, designed to supply their fighting units so as to keep them always ready for action and without hampering their freedom of movement. Consult *Field Service Regulations of the United States Army* (Washington, 1914). See LOGISTICS; STRATEGY; TACTICS, MILITARY.

MILITARY SERVICE INSTITUTION OF THE UNITED STATES.

An organization controlled by officers of the United States army, associated with the National Guard and others for professional improvement, the interchange of views upon military matters, and such topics in general as may be calculated to promote the military interests of the United States. In 1877 General Stanley, General Fry, General Rodenbough, and Colonel Lieber issued a circular requesting the presence of the officers in the army at a meeting to consider the practicability of forming an association similar to the Royal United Service Institution of Great Britain. About 40 officers responded, and the Institution was organized, with General Hancock as president. The headquarters of the Institution are at Governors Island, N. Y. The *Journal of the Military Service Institution*, a bimonthly, published its first number in January, 1880, and is devoted to military history and the discussion of current military questions, domestic and foreign. It is universally regarded as a publication of great international importance in its own domain. Under the management of the publication committee, essays upon military subjects, for which prizes of gold and silver medals and money are annually awarded, have been a feature. Under an agreement between the Public Library of the City of New York and the Military Service Institution, the entire collection of books and pamphlets belonging to the Institution (amounting to nearly 10,000 volumes, among which are many rare books and manuscripts), with the exception of those needed for reference, has now been placed in a section of the library at Fifth Avenue and Forty-second Street, to be known as the Military Section, duly catalogued and made available for the circulation to members of the Institution and for reference to the general public. The Institution also possesses a valuable collection of military relics and trophies, together with specimens or models after the latest war material, open to visitors.

MILITARY TENURE. A form of land-holding in England under the feudal system of land tenure, originally based on the obligation of the freehold tenant to render actual military duty to the crown as the service or rent due from the land so held by him. It was also known as tenure in chivalry or by knight's service. See FEUDALISM; TENURE.

MILITARY TERRITORIES OF FRENCH SUDAN. Formerly three territories comprising the eastern part of the African region previously known as French Sudan (q.v.), and extending from the eastern boundary of French Senegal and French Guinea to Lake Chad, and from the northern borders of Nigeria, Dahomey, Togo, the Gold Coast, and the Ivory Coast northward into the Sahara Desert. The region included in these territories comprised in 1915 the French colony of Upper Senegal and Niger and the Military Territory of the Niger. See FRENCH SUDAN; FRENCH WEST AFRICA; NIGER, MILITARY TERRITORY OF THE; UPPER SENEGAL AND NIGER.

MILITCHEVITCH, mě'lě-chěv'ich, DJAKOV MILAN (1831-1908). A Servian ethnologist and writer on educational topics. He was born near Belgrade. Having studied theology and done some teaching, he obtained, in 1852, a state office and was made secretary to the Servian Minister of Education in 1861. In 1886 he was appointed librarian of the Belgrade National Library. Among his writings are an exhaustive topographical work, *The Principality of Servia* (1876); *Servian Peasant Life* (1867, 1894); *The Kingdom of Servia* (1884); *Letters on the History of the Servians and Bulgarians* (1858-59); *Education in America* (1863); *Letters of a Tourist* (1865); *Schools in Servia* (1868); *Lives of Famous Servians* (1888); the pedagogical periodical *Skola* (*The School*, 1868-76), and short sketches like *Furmus and Fatima* (1879) and *Winter Evenings* (1879). Militchevitch was one of the most learned and talented Servian authors of his time.

MILITELLO, mě'lě-tě'l'lo, IN VAL DI CATANIA. A town in the Province of Catania, Sicily, situated 25 miles southwest of Catania, with which it is connected by rail. It trades in wine, tropical fruit, and silk. Pop. (commune), 1901, 11,539; 1911, 11,232.

MILITIA, mi-lish'ă (Lat. *militia*, military service, soldier, from *miles*, OLat. *meiles*, soldier). The entire body of male citizens liable to military duty. In England, since 1908, the organized forces are called the *regular army* and the *territorial army*. The regular army has two reserves—the *army reserve* and the *special reserve*. The latter was created out of the militia in 1907. The *territorial army*, which serves only at home in peace time and is intended primarily for home defense, amounted to 315,000 in 1914. This latter force corresponds to the *organized militia* in the

United States. In addition the colonies maintain militia forces, called citizen forces or territorial armies. Specifically the title applies to the purely defensive branch of the national military system of the countries referred to, the *mobile and territorial militia* of Italy and the *opolchénie* of Russia closely resembling it. The *Landwehr* and *Landsturm* of Germany and Austria and the *territorial army* of France may also be regarded as the militia equivalent, the service, however, being compulsory instead of voluntary as in England and the United States. In the United States the system differs somewhat from the English in that it is not a Federal or national force, unless called into the service of the Federal government or unless accepted as volunteers by the President during the existence of war or when war is imminent under the provisions of the Act of Congress approved April 25, 1914. When the militia, as such, is called into the service of the United States it must serve during the period specified by the President in the call for militia, but individuals cannot be held beyond the period of the existing State commission or enlistment, usually two or three years. As militia it cannot serve without the territorial limits of the United States. If the militia, however, changes its status to that of volunteers and is accepted as such under the Volunteer Act of April 25, 1914, such troops then serve, unless sooner discharged, for a period of four years, and may be employed beyond the territorial limits of the United States. The act quoted is regarded as one of great moment in that it affords a means of changing the State militia into a true Federal force subject to all the rules and regulations of the regular army except that no reserve service is required. From 1775 to 1783 the bulk of the Federal armies consisted of State troops, a condition which continued to exist long after the Revolution itself. The United States militia consists of every able-bodied male citizen of the respective States, Territories, and the District of Columbia, and every able-bodied citizen of foreign birth who has declared his intention to become a citizen, who is more than 18 and less than 45 years of age. It is divided into two classes—the organized militia, known as the national guards of the State, Territory, or District of Columbia, or by such other designation as may be given them by the laws of the respective States or Territories, and the remainder known as the reserve militia. It is impracticable of course for the President to call out this reserve militia, as it does not possess a military organization. The organization, armament, and discipline are the same as those prescribed for the regular and volunteer armies of the United States, but the effectiveness of the organized militia as a military force is seriously handicapped by the constitutional provisions which reserve to the State the appointment of all officers in peace and war, the training and government of the forces when not in the service of the United States, and the limited instruction provided by the State authorities in peace. The officers are usually elected by the men and appointed by the governor. The President may call out, for a period specified by him, such numbers of the militia of the States, Territories, or District of Columbia as he may deem necessary "to suppress insurrection, repel invasion, or to execute the laws of the Union," but for no other purpose. During their period of service

they become subject to the same rules and articles of war as the regular forces, except that they cannot be called upon to serve outside the United States. Experience in using State militia as a Federal force has always proved unsatisfactory. In 1915 legislation for the creation of a national militia was under consideration. Each State and Territory and the District of Columbia has an adjutant general, who is charged with the duties as prescribed by the State and the rendering of regular reports to the Secretary of War regarding the strength, condition, etc., of the organized militia of the State to which he belongs. See *Army* under UNITED STATES.

The table on page 668 is an abstract of the militia force of the United States (organized), according to the report of the Chief of Division of Militia Affairs, War Department.

The militia of Great Britain was a constitutional force raised under authority of Parliament for national defense only. It could not be used on foreign service without its consent and the authority of Parliament. Before the Norman Conquest rents for land were paid in body service, the able-bodied men of each family bearing arms in numbers proportionate to the land held by the family. This system is attributed to the Saxon King Alfred. The country was organized into dikedoms, hundreds, tithings (ten tithings making the hundred), and families, the number of families in a tithing varying with the necessities of the times. After the decisive battle of Hastings (1066) the *fyrð*, as the militia was then called, ceased to exist officially, although continuing to give the Normans considerable trouble. The national exigencies during the Seven Years' War rendered imperative the reorganization of 1757, since which period more attention has been devoted to it. In 1871 the War Office assumed control and the county authorities ceased to have any active interest in it other than the right to nominate officers. In 1906 it was a part of the military territorial system, two or more local militia battalions being attached to each territorial district and forming the third, fourth, or fifth battalion (as the case might be) of the regular regiments to which they were attached. In 1908 the militia was abolished and converted into the special reserve and territorial force. See *Army* under UNITED KINGDOM.

In Russia what is now the *opolchénie* was originally a simple militia, which was reorganized in 1888 and again in 1891, when the period of service was changed from 40 to 43 years for the soldiers and from 50 to 55 for the officers. Service in the Russian army, 1914, is as follows: from the twentieth to the forty-third year, divided into two classes—service in the active army and its reserve for 18 years, service in the *opolchénie* or territorial army for 5 years. The *opolchénie* is divided into two "bans," or levies, (1) trained men who have passed through the active army and the annual surplus of young men, (2) the *levy en masse*, containing all those exempted from actual service, whether as students, only sons, or those not up to physical standards, and also the older classes of the surplus men who have all had a certain amount of training. This second "ban" corresponds to the United States reserve or unorganized militia.

Service in the Italian army, 1914, is for 19 years. Commencing at the age of 20, there are three classes, as follows: first, those in the permanent army; second, those in the permanent

* Detailed from First Infantry; included in regimental report.

† Vacancy in office of brigade commander

‡ No organized militia (mustered out May 20, 1906).

army but with "unlimited leave"; third, those exempted from active service, who are assigned to the territorial militia. The time is spent as follows: 2 years with the colors, 6 years in the reserve, 4 years in the mobile militia, 7 years in the territorial militia, total 19 years, thus completing service at the age of 39.

Service in the French army, 1914, is from the age of 20 to 48. In the first line or active army, 3 years; in the reserve for that army, 11 years; in the territorial army, 7 years; in the territorial reserve, 7 years; total service 28 years, ending in the forty-eighth year.

In Switzerland the entire army, comprising as it does every able-bodied citizen, is a militia. Switzerland is unique in that it has no permanent or standing army, depending solely on its national militia. Service extends from the seventeenth to the forty-eighth year, actual service commencing at 20. Periods (1914) are

maræ, to rub off). The liquid secreted by the mammary glands of all mammals and used primarily to nourish their young. From the earliest time it has been esteemed an important and necessary article of food and many hidden virtues were ascribed to it by the ancients. Its exact composition continued long unknown, and until the beginning of the seventeenth century fat, casein, and whey were the only constituents recognized. In the early part of the eighteenth century Leeuwenhoeck discovered the microscopical characteristics of milk, and about the same time Boerhaave made a qualitative examination. The first quantitative analysis of milk recorded was made in 1737 by Geoffrey, who determined with considerable accuracy the casein, milk sugar, and mineral matter.

The milk from different animals varies considerably in composition, as shown in the following table:

COMPOSITION OF MILK

KIND	Water	Total solids	IN TOTAL SOLIDS				
			Fat	Casein	Albumin	Milk sugar	Ash
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>

as follows: 12 years in the first line, called the Auszug or Elite; 8 in the Landwehr; 8 in the Landsturm. A soldier has from 65 to 90 days' training the first year, and subsequent annual trainings of 11 days each for seven years, when all below the rank of sergeant are excused from further attendance. The Landwehr are called out only once for 11 days. It is thus seen that this is a true militia—first trained and then returned to civil pursuits, subject to call when needed—and that there is no standing or permanent army as in the other countries just referred to. This militia service, however, is compulsory and universal. See CONSCRIPTION; LANDSTURM; LANDWEHR; NATIONAL GUARD; VOLUNTEER, MILITARY; and section *Army* under the different countries.

MILKUM, mil'ūm. A skin disease known also as grutum. It is characterized by the formation of small, round, noninflammatory elevations situated immediately beneath the epidermis and consisting of sebaceous matter. These bodies are distributed mainly on the eyelids, forehead, and face, occur especially in elderly people, and may in time undergo calcification. Colloid milium is a rare form of the disease in which the bridge of the nose, forehead, and cheeks present minute shining lesions of a pale lemon color.

MILK (AS. *meole*, *meoluc*, Goth. *miluks*, OHG. *miluk*, Ger. *Milch*; connected with AS. *melcan*, OHG. *melchan*, Ger. *melken*, Lat. *mulgere*, Gk. ἀμείγειν, *amelgein*, OChurch Slav. *mlēsti*, Lith. *mlėti*, to milk, Skt. *marj*, Av.

The above are general averages of a greater or less number of analyses, depending upon the kind of milk animal, each kind of which gives milk that varies considerably with the individual as well as with the species. There is, furthermore, some difficulty in arriving at a general average for any kind of mammal, since normal milk is obtained with difficulty from animals unaccustomed to being milked.

Properties of Cows' Milk. Since, in general properties and composition, cows' milk is typical of all milks, is of chief commercial interest, and has been studied much more in detail, it will be the main subject of this article. The milk secreted immediately after parturition is termed *colostrum* (q.v.), or *beastings*, and differs considerably from normal milk in both physical and chemical characters. Milk from which the fat has been removed by skimming or by the separator is called skim milk (q.v.), and the residue left after churning cream is known as buttermilk (q.v.). Whey (q.v.) is the liquid remaining after the curd of the milk has been separated.

Cows' milk is an opaque, whitish liquid, sometimes faintly yellow or bluish, with a slight alkaline reaction and a sweetish taste when fresh. It is heavier than water, its specific gravity ranging usually from 1.029 to 1.035, the average for mixed milk being about 1.032. By removing the fat (skimming the cream) the specific gravity is raised and by adding water it is lowered. This is the basis of a simple, but (when taken alone) unreliable, test of the qual-

ity of milk and of the practice of skimming. Chemically, milk consists of an aqueous solution of milk sugar, casein, albumin, and ash, with the fat in suspension, forming an emulsion. The water and the constituents dissolved in it constitute the milk serum, and the constituents (i.e., the dry matter) minus the water are designated total solids. The proportion of total solids is a general indication of the richness of the milk. Among the solids the chief importance attaches to the fat. First, it is the measure of the value of milk for butter making, and to a very great extent for cheese making also; second, it is the constituent which more than any other gives milk its appearance of richness; third, it fluctuates more widely than any other constituent. Milk fat is a familiar substance in the form of butter, which contains about 85 per cent of fat, some water, salt, and casein. The fat in milk is in the form of minute globules held in suspension, and on standing it rises to the surface as cream (q.v.), which contains some of the other constituents in smaller proportion. The globules may be readily seen by means of a microscope. For a long time fat globules were believed to be surrounded by a membrane or proteid coating, which was destroyed by churning the cream and thus allowed the fat to unite into a solid mass. This view is still held by some, but the prevailing belief at present is that the globules are free and owe their spherical form to the surface tension. The globules vary greatly in size, being from $\frac{1}{1000}$ to $\frac{1}{2000}$ of an inch in diameter. A pint of average milk has been estimated to contain not far from a million globules. The size of the globules varies with the period of lactation, diminishing towards the close, and to some extent with the breed and the individual. The globules in the Jersey and Guernsey milk are relatively large; in Holstein milk very small. The large globules rise more rapidly, and milk containing them creams more readily and completely.

Milk fat is a pale yellow substance consisting of a mixture of the glycerides of eight or more fatty acids. Of these olein constitutes about 35 per cent, palmitin 25.7, myristin 20, laurin 7.5, butylin 3.85, caprin 3.6 per cent, and the remainder is principally caprylin and stearin. By the action of caustic alkali these glycerides are broken up into their respective fatty acids and glycerin, and a certain relatively small proportion of these, including the butyric, caproic, and caprylic acids, are volatile. The characteristic flavor and aroma of milk and butter are due largely to butylin, and this decomposes readily, forming butyric acid, which is evident in rancid or "frowy" butter. The chief nitrogenous or albuminoid constituent of milk is casein, which is of prime importance in cheese making. It is coagulated by rennet and by acids, and this is what gives sour milk its thick curdled appearance. The acid developed in souring precipitates the casein, which gradually separates from the soluble constituents, inclosing much of the fat. Casein is held in solution in milk by the presence of lime salts, and lime water causes it when curdled to separate in a much more finely divided condition. The albumin of milk is not curdled by acids or rennet, but is acted upon by heat. Fibrin, similar to that of blood, globulin, nuclein, and several other nitrogenous bodies, have been found in milk in small quantities, but are of little importance. The sugar in milk, chemically known as lactose, is not so sweet as

cane sugar. It is in solution. The ash of milk consists of a mixture of a number of salts, but is composed principally of the phosphates of lime and potash, the chlorides of potash and soda, and small amounts of phosphate of iron and magnesia. Some of the phosphate of lime appears to be associated with the casein, which also contains some sulphur. Most of the salts are in solution. Besides the constituents named, milk contains normally a coloring matter, a trace of citric acid, urea, and several other bodies. The fat and the albumin of milk are the most variable constituents, the ash and the sugar the least so. The casein bears a quite constant ratio to the fat, rising and falling with it.

The natural yellow color of milk, as Eckles has found, is due to the pigments carotin and xanthophyll, constituents of green plants, which are taken up from the feed and secreted in the milk fat.

Variations in Milk. The richness of milk is to a certain extent an individual characteristic; i.e., some individuals normally give rich milk, while others, for no apparent reason, give milk containing large percentages of water. The richness of milk has been increased by domestication, care, and breeding, and certain breeds of cows, sheep, goats, etc., have been produced which give a characteristically rich milk. The quality also varies with the stage of lactation. The milk given early in the lactation period is usually poorer than that secreted later, and grows richer towards the close of the period until the animal "goes dry." Young animals usually give poorer milk and less of it than after the third or fourth parturition, and the milk from the first part of any milking is poorer than the last part, or "strippings." The kind of food has little effect on the composition of milk, provided it is wholesome and the amount sufficient. Food influences the proportion of the different fatty acids composing the fat, and so has an effect on the hardness and other qualities of butter. But the rather prevalent notion that the milk fat can be permanently increased by feeding has been shown by much careful investigation to be a fallacy. Little is known of the physiological processes by which the constituents of the food are transformed into milk constituents. In some cases there appears to be a direct transmission of the constituents from the food to the milk, as is noticeable when cows eat garlic, onions, etc. The experiments of Jordan at the New York State Experiment Station have shown that milk fat is not derived solely from the fat of the food, for cows fed upon food from which the fats were practically completely extracted continued to secrete milk of normal composition for long periods, and, judging from the maintenance of their weight, did not draw upon their body fat to supply this ingredient. Under the conditions of the experiments the carbohydrates seemed to be utilized to some extent in the elaboration of milk fat. The more the process of milk secretion is understood the more apparent it becomes that richness and the volume of the yield are individual characters, and if cows have a tendency to give poor milk no amount of feeding will overcome it. The remedy lies in getting better cows. For general statements regarding the composition of the milk of different breeds of cows, see CATTLE.

As an illustration of the variation of the milk of ordinary cows of mixed breeding the data

obtained by Van Slyke in New York from the analysis of the mixed milk of 15,000 cows each month from May to October may be cited. The total solids ranged from 11.17 to 13.91 and averaged 12.67 per cent, and the fat from 3.04 to 4.06 and averaged 3.75 per cent. The content of total solids and of fat was lowest during the summer months and increased in the fall. In the analysis of over 3000 samples of milk at the Massachusetts Experiment Station the total solids varied from 10.02 to 19.55 and averaged 13.57 per cent, and the fat from 1.5 to 10.70 and averaged 4.32 per cent. The analysis of 800 samples made at the experiment stations in different parts of the country varied in total solids from 9.3 to 19.7 per cent, averaging 12.8 per cent, and in fat from 1.7 to 6.5, averaging 3.7 per cent.

Milk Fermentations. Milk is subject to a great variety of fermentations, for it is a favorable medium for the growth of many kinds of bacteria, yeasts, and other fungi which cause numerous changes in its constituents. Thus, while one class of organisms curdles milk by the production of lactic acid, another class gives it an alkaline reaction, at the same time curdling it; others impart to it a deep blue, violet, yellow, green, or red color, by the production of pigments in the milk; others give it a bitter or other unpleasant taste; another class produces alcohol from the milk sugar, and is taken advantage of in the preparation of such beverages as kumiss and kefir (qq.v.), and still others cause putrefaction. The most common and familiar change is the souring of milk, due usually to the action of lactic-acid bacteria. Under ordinary conditions normal milk nearly always undergoes some sort of lactic fermentation on standing. The production of lactic acid soon curdles the milk and obscures all other forms of fermentation, and the acid stops the growth of other bacteria, so that no subsequent effects are usually seen. The popular belief that the electricity in the air during thunderstorms sours milk appears to be unfounded, but its rapid souring at such times is due to the climatic conditions prevailing, which hasten bacterial growth. The same difficulty in keeping milk is experienced during very hot weather. Curdling is not always due to the formation of acid; milk apparently sour may have no acid taste. In such cases the cause is due to alkaline fermentation, induced by another class of organisms. The milk becomes coagulated into a soft slimy mass, which is usually bitter and has an alkaline or neutral reaction. Ordinarily this form of fermentation is not very apparent, as the organisms causing it grow slowly and the lactic-acid organisms get the start of them. The organisms which produce butyric acid in milk attack and decompose the fats, giving a rancid odor. In the ordinary handling of milk the latter are of little importance, but it is supposed that they have an important effect upon the keeping properties of butter. Several organisms have been described which impart a bitter taste to milk, due, in some cases at least, to the production of a bitter principle. Milk which has been boiled is likely to develop a bitter taste, for the reason that the heating kills the lactic-acid germs, while the bacteria causing the bitter taste usually possess endospores which are not destroyed by heat and so have a clear field for action. A slimy fermentation of milk is a somewhat common occurrence, and occasionally pro-

duces great trouble in dairies, since it destroys the milk for all ordinary uses. Such milk becomes thick and ropy, will not cream, cannot be churned, and is unfit for drinking. It may be caused by a variety of organisms. There are several forms of the trouble. One known as the "lange wei" (long or stringy whey) is made use of in the manufacture of Edam cheese in Holland, to control the gassy fermentation of the curd.

In addition to the fermentations and other changes in milk due to microorganisms, rennet, an unorganized ferment obtained from the stomach of the calf and from some plants, ferments milk, causing it to curdle. This ferment is employed in cheese making to produce the curd. Babcock and Russell have discovered an unorganized ferment termed "galactase" in milk, which they believe to be a normal and inherent constituent, and which is active in the ripening of cheese, causing the characteristic changes in the green cheese which make it suitable for eating.

The chief sources of bacteria in milk are the cow herself, the milker, the dust of the stable, and the dairy utensils. It has long been believed that pure milk drawn from a healthy cow contains no bacteria and that all bacterial contamination of the milk comes from external sources. However, the large calibre of the milk duct makes it possible for bacteria to enter it and grow to a considerable extent, so that it becomes a matter of extreme difficulty to obtain milk from the cow, even with the greatest precautions, which shall not be contaminated. The hairs of the cow are always covered with dirt and dust, and the air of the stable is charged with dust from the fodder and bedding material, so that it is impossible to prevent some dirt from falling into the milk pail. Thus large numbers of bacteria, especially in poorly ventilated stables, reach the milk. Any dirt upon the hands or clothing of the milker will have abundant chance to get into the milk pails and cans. The milk vessels themselves are an important source of contamination, the corners and creases retaining bacteria which have not been removed or killed by the washing. The warm milk furnishes favorable conditions for the growth of these microorganisms which have gained access and which for a time multiply rapidly.

Several species of bacteria classed as pathogenic organisms are capable of living or even increasing in milk, but since they do not ferment the milk or alter its appearance sufficiently to be detected by a physical examination, their presence is not readily determined. Except in very rare instances the milk becomes contaminated after it has been drawn and in practically all these cases the cause of contamination is some form of uncleanness, either of the stables, the water, the utensils, or the attendants. It is gratifying to know, however, that through the efforts of the United States Department of Agriculture, the agricultural experiment stations, and the dairymen themselves, the sanitary management of dairies is being constantly improved, and through the vigilance of State-appointed dairy inspectors unsanitary conditions are corrected as soon as discovered.

Milk Adulteration and Control. The milk supply of towns and cities has for many years been regulated by laws and ordinances and subjected to inspection. The object of this was formerly to prevent adulteration, but of recent

years the inspection has often extended to the herds and stables and all that relates to the milk trade. It has come to be realized that such factors as the health of the cows, hygienic condition of the stables, and cleanliness in the handling of the milk are quite as essential to pure wholesome milk as freedom from adulteration. Hence the veterinary inspection, which has been introduced in some cities, should be extended. Milk is most often tampered with by removing a part of the cream or by diluting it with water or skim milk. Coloring matter is sometimes added to make it appear richer, but the addition of chalk, burnt sugar, or similar substances is now rare. Preservatives, such as formaldehyde, borax, and salicylic acid, are frequently added to prevent milk souring. Opinions differ as to the injuriousness of these preservatives, but their use is generally condemned on the ground that they are unnecessary in pure milk and that they are a cloak for insanitary practices in the dairy. The standards for milk adopted by different States vary from 11.5 to 13 per cent for total solids and from 2.5 to 3.5 per cent for fat. Milk found below these standards is held to be adulterated. A standard of 12.5 per cent of total solids and at least 3 per cent of fat seems fair.

Various means of testing milk as to its quality have been suggested from time to time. Of these the lactometer is the simplest and has been extensively used by milk inspectors who have a large number of samples to examine daily to detect watering or skimming. It is a form of hydrometer, and shows the specific gravity of milk upon a graduated scale. But there are so many factors that affect the specific gravity, and this may vary so much in pure milk, that the lactometer reading is only an indication and cannot be relied upon as final. The most reliable and satisfactory of the simple milk tests is the Babcock test, which has come into very widespread use in the milk inspection of towns and cities and in determining the fat content of milk as a basis for paying for the product at creameries. (See CREAMERY; BUTTER MAKING.) This test is made in a special bottle having a narrow graduated neck. A definite quantity of milk is treated in the bottle with sulphuric acid to dissolve the curd and set the fat free. The bottle is then whirled rapidly in a centrifugal apparatus for a few minutes, to aid in separating the fat; hot water is added to bring the fat up into the neck, after which the bottle is whirled a second time and the column of fat read off on the graduated scale. The reading gives the percentage of fat without calculation. A large number of samples may be tested simultaneously, and the method has been shown to be very accurate after a little practice. It shows only the fat content, which is the common measure of richness; but from it and the lactometer reading the total solids and other constituents can be calculated. A bacteriological examination is rarely made in connection with the ordinary milk inspection.

Milk as Food. Milk is peculiarly adapted to be a food for man principally because it contains the four classes of nutrients—protein, fat, carbohydrates, and mineral matter—in more nearly the proper proportions to serve as a complete food than perhaps any other single food material. (See Food.) A quart of milk contains about four ounces of nutritive material, or about the same as three-quarters of a pound of beef or as

six ounces of bread. Although these quantities of milk, beef, and bread supply like amounts of total nutrients, their nutritive values are not the same. In other words, they would not be equally useful as food, owing to the relative proportion in which the nutrients are present. Protein, fat, and carbohydrates occur in milk in about equal proportions. The chief nutrients in bread are carbohydrates and protein, and in meat protein and fat. Either milk or bread eaten alone would make a better balanced food for man than meat. In general, milk and cream together furnish to the diet of average American families about 20 per cent of the total food, 11 per cent of the total protein and also of the total fat, and about 5 per cent of the total carbohydrates. Dairy products (milk, cheese, butter, and cream) furnish over 22 per cent of the total food, 12 per cent of the protein, 32 per cent of the fat, and 5 per cent of the carbohydrates.

As regards the digestibility of all its ingredients, milk is one of the most digestible of animal foods. It has been found that on an average an adult digests about 97 per cent of the protein, 95 per cent of the fat, and 98 per cent of the carbohydrates of milk. According to American experiments, a child one year old eating milk digests on an average only about 90 per cent of the protein, 96 per cent of the fat, and 86 per cent of the carbohydrates of cows' milk. When milk is taken into the stomach it is speedily curdled by the action of the pepsin and acid of the gastric juice. When eaten alone or in large quantities the casein gathers in large lumps, which in some persons may be difficult to digest. This is particularly the case with infants and with adults whose digestion is weak. The casein of human milk is precipitated in more flocculent form than that of cows' milk, and is thus more easily digested and does not cause irritation. Lime, which tends to prevent the curdling of the casein of cows' milk in lumps, is frequently added as lime water to milk that is to be fed to infants or to adults of delicate digestion. The results of experiments upon the effect of cooking milk are conflicting. The more common experience seems to indicate that cooking or heating the milk renders it more difficult to digest. Some persons, however, cannot take fresh milk with comfort, but can digest boiled milk.

Milk is often said to be a perfect food. It is so for the young of the species of animal producing it, but there are three reasons why it cannot be considered a perfect food for adults. 1. The proportion of water is so large that great quantities (from 4 to 5 quarts) would have to be consumed each day in order to obtain the necessary nutrients. 2. The protein is present in rather large quantities as compared with the fats and carbohydrates. Thus, the milk necessary to furnish the 0.28 pound of protein per day, estimated to be required by a man at moderately active work, would yield only 2700 calories of energy, while milk in sufficient quantity to furnish the 3400 calories estimated as necessary would yield 0.34 pound of protein. 3. It is a well-recognized fact that the digestive functions require that food itself, besides the water taken with it, shall have a certain bulk. Cattle cannot generally be maintained in health upon a condensed ration such as grain; they seem to require a certain distention of the stomach, such as is brought about by the fibre (cellulose or woody matter) of grass or hay. In

like manner it seems desirable that man should have a certain amount of bulky material to produce distention or to promote peristaltic action of the intestines, or for other purposes not well understood. Of course, the nutritive constituents of milk, considered separately, are highly concentrated foods. While, therefore, milk alone cannot be considered as a perfect diet for adults, it is of special value as a food for invalids, because it is, as a rule, easily taken, easily digested, and does not generally irritate the alimentary canal. Furthermore, a milk diet is more readily under the control of the physician both as regards quantity and quality than a mixed diet is. If for any reason a child cannot be nourished on mother's milk, the most useful substitute is modified cows' milk. Various infant foods and milk substitutes have been proposed and are sold under divers trade names.

As a food for adults cows' milk is unusually well adapted for use in connection with other foods, either in its uncooked form in tea and coffee, as a beverage, as bread and milk, etc., or incorporated and cooked with other materials. In many culinary products it can be used instead of water. Analysis of bread, rolls, etc., made with milk would show about one-tenth more protein and one-twentieth more fuel value than bread made with water. Milk is very generally used in many kinds of cake and pastry and in custards. Where desirable from economical reasons, or as a means of increasing the proportional amount of protein in a diet, skim milk can be advantageously substituted for whole milk. At the price ordinarily paid in our large cities milk is a food of reasonable cheapness, and at the prices prevailing in small cities and country towns it is an economical food. Condensed milk is a more nutritious food, pound for pound, than fresh milk, since it has been concentrated by evaporation. It is, however, usually diluted before it is used, and then approximates fresh milk more or less closely in composition and food value. If the condensed milk contains added sugar its carbohydrate content is, of course, higher than that of unsweetened condensed milk, and when diluted, proportionally higher than that of fresh milk. Cream, which contains the greater part of the fat of the milk, as well as some protein and carbohydrates, is chiefly valuable in the diet as a source of energy. Curds obtained in the manufacture of cheese are eaten to a limited extent. They consist quite largely of the casein of milk, and hence supply the body with building material as well as energy. Butter and cheese (q.v.), the principal milk products used as food, are of great importance as articles of diet.

There are at least four distinct fermented beverages prepared from milk—kefir (q.v.), kumiss (q.v.), matzoon (q.v.), and leben. They are properly classed as food beverages and are often recommended for the sick and for convalescents. A number of special foods are made from the dry casein of milk and are used to a considerable extent by physicians to supply protein in a readily digestible form. The albuminoids of milk are used in the manufacture of egg substitutes. Milk sugar prepared from whey is an important article of diet for invalids and is used in medicine and in other ways. See MILK PRODUCTION.

Condensed Milk is the fresh milk of cows from which a considerable part of the water has been removed by evaporation to a semifluid

condition, and to which sugar is usually, although not always, added to aid in preserving it. Both the sweetened and the unsweetened products are put up in hermetically sealed tin cans, or in bulk for the use of bakers, confectioners, and ice-cream manufacturers. Originally the unsweetened milk was sold under the name of evaporated cream, but this is forbidden under the pure-food laws.

The process of making condensed milk was invented by an American, Gail Borden, and patented in 1856. In this process the milk was concentrated by heating in a partial vacuum under a low degree of heat, and this principle is still employed in making the great bulk of condensed milk in the United States and Europe, in spite of numerous other processes. The product is made at factories, which require to be equipped with expensive machinery and need a large milk supply, preferably 15,000 pounds a day.

In 1909 the United States Census reported the production of condensed milk at nearly half a billion pounds a year, valued at \$33,563,129. In 1914 the total number of condenseries in the United States was estimated at nearly 250. The industry has made rapid progress in Canada, Austria, New Zealand, Switzerland, Germany, Great Britain, Holland, Sweden, Norway, Russia, Japan, and India. The standard for condensed milk is about 28 per cent of total solids.

Milk Powder, Desiccated Milk, or Dehydrated Milk is made by evaporating milk, whole or skimmed, to dryness. The difference between the product and condensed milk is mainly in degree of concentration. The industry has developed rapidly in recent years. The bulk of the powder is made from skimmed milk, as that from whole milk becomes rancid rapidly. There are several processes. In one of the most successful the milk is condensed in a vacuum pan to about one-third its volume and then sprayed into a current of hot air in an evaporating chamber, where it rapidly parts with its vapor, the milk solids falling to the bottom as a finely divided powder. The powder contains 5 to 8 per cent of water and from 10 to over 20 per cent of fat, according to the process and the kind of milk used. The skim-milk product has about 37 per cent of proteids and 46 per cent of milk sugar. This product will keep indefinitely if not allowed to become moist. Vast quantities of milk powder are used in making milk chocolate and by bakers and confectioners. The proteids must be in soluble form to make the powder a satisfactory substitute for milk when dissolved in water. This is secured by keeping down the temperature of evaporation to prevent change in these bodies.

Bibliography. The literature of milk is extensive. In addition to the publications of the United States Department of Agriculture and the bulletins of the various experiment stations, the following works may be mentioned: C. M. Aikman, *Milk: Its Nature and Composition: A Handbook on the Chemistry and Bacteriology of Milk, Butter, and Cheese* (New York, 1895); W. Fleischmann, *The Book of the Dairy: A Manual of the Science and Practice of Dairy Work*, translated by Aikman and Wright (London, 1896); Hogan, *How to Feed Children* (Philadelphia, 1896); Holt, *Diseases of Infancy* (New York, 1899); Monrad, *Pasteurization and Milk Preservation* (Winnetka, Ill., 1901); De Rothschild, *Bibliographia Lactaria* (Paris,

1901), containing 8375 titles; H. D. Chapin, *Theory and Practice of Infant Feeding* (New York, 1902); H. W. Conn, *Bacteria in Milk and its Products* (Philadelphia, 1903); R. Lezé, *Les industries du lait* (Paris, 1904); E. F. Willoughby, *Milk: Its Production and Uses* (Philadelphia, 1905); L. L. van Slyke, *Modern Methods of Testing Milk and its Products* (New York, 1906); H. Snyder, *Dairy Chemistry* (ib., 1906); Russell and Hastings, *Outlines of Dairy Bacteriology* (9th ed., Madison, Wis., 1910); W. G. Savage, *Milk and the Public Health* (London, 1912); Farrington and Wall, *Testing Milk and its Products* (Madison, Wis., 1912); H. H. Wing, *Milk and its Products* (rev. ed., New York, 1913), containing a bibliography; Levi Wells, "Condensed and Desiccated Milk," in *United States Department of Agriculture, Yearbook, 1912* (Washington, 1913); O. F. Hunziker, *Condensed Milk and Milk Powder* (Lafayette, Ind., 1914); R. T. Mohan, "Manufacture of Condensed Milk, Milk Powders, Casein, etc.," in *Society of Chemical Industry, Journal*, vol. xxxiv (London, 1915).

MILK, CONDENSED. See MILK.

MILK, FERMENTED BEVERAGES. See KEFIR; KUMISS; MATZOON.

MILK CURE. The treatment of disease in the adult by the use of milk as a diet. In the milk cure all other food and drink are suspended for a time. Acting upon the information that milk requires about three hours for complete digestion, four ounces of milk are taken by the patient every three hours, beginning on rising in the morning. In a few days one or two tumblerfuls are taken at a time in place of the smaller quantity. Usually a patient takes two quarts a day; in some cases the total amount reaches five quarts. It is generally administered warm. In cases of stomachic or intestinal disorders the milk is allowed to stand for 24 hours and is then skimmed before being administered. Lime water, in the proportion of one-fourth of the bulk, overcomes the patient's repugnance to the diet and renders it more easy of digestion. Or the milk may be flavored with coffee, cocoa, salt, or caramel. After two or three weeks of strict milk diet it is advised that a little stale bread be added three times a day. A week later about two tablespoonfuls of rice or a little arrowroot is added. At the fifth week a chop is given once a day, and a few days later two chops a day are allowed. At the end of the sixth week full meals of various foods are resumed, milk continuing to be a principal part of the diet. Coffee, or aloes, or laxative mineral water is employed to overcome the constipation attendant upon a milk diet in adults.

The milk cure is successful in some cases of dyspepsia, gastric ulcer, chronic intestinal indigestion, enteralgia, chronic diarrhoea, and dysentery. In the treatment of ascites of hepatic origin it has been used since the days of Hippocrates, who refers to it. It has also proved efficacious in kidney and cardiac diseases and in rheumatic and gouty affections.

MILK FEVER, IN WOMEN. A slight, transient rise in temperature, preceded by chilly sensations, attending the establishment of the milk secretion in parturient women. Antisepsis and rational feeding have largely done away with milk fever, some modern authorities even doubting its existence. The older writers describe a condition in which the breasts become swollen, reddened, and tender, with a diminution in the

lacteal discharge. It is seen occasionally in well-marked form in debilitated women, in whom a distinct chill, followed by a sharp rise in temperature and sweating, occurs. The condition requires no treatment, as a rule, except purgation.

MILK FEVER, PARTURIENT APOPLEXY, or PARTURIENT PARESIS. An afebrile disease of cows, especially good milkers of improved breeds in good condition, which occurs only at or near the time of calving. Parturition and plethora are preëminently the causes of the disease. Predisposing causes include confinement in the stall, high temperature, electrical disturbances, constipation, and mature age. The latest work indicates that the main cause of the disease is the production of poisonous metabolic products by secreting cells of the follicles of the udder, which act on the brain and central nervous system. The disease rarely follows the first and second calvings. One attack seems to predispose towards another. It appears in two forms—congestive and torpid. In the congestive form the cow suddenly becomes dull, allows the head to droop, staggers in attempting to walk, falls, and lies either on the breastbone, with the head turned around to the side and resting on the muzzle, or stretched out on the side. The pupil of the eye is dilated and the head and horns are hot; the bowels and bladder soon become torpid or completely paralyzed and fail to operate unless recovery takes place. In the torpid form there is no marked fever and no congestion of the head. The animal slowly becomes drowsy and weakened, falls down, and, unless relieved, finally succumbs. Insensibility is a pronounced symptom in the later stages of both forms.

Preventive measures include a spare diet for a week before calving and at least four days after, a free access to salt and water, a dose of Epsom salt (one to two pounds) 12 to 24 hours before calving is due, and the postponing of the drawing of any milk from the udder for 12 to 24 hours after calving.

The treatment of milk fever has been completely revolutionized by the investigations of Schmidt of Denmark, which have resulted in the universal adoption of the method of inflating the udder with oxygen or filtered air. Under this treatment the mortality in milk fever in the cow has dropped from 60 to 75 per cent to less than 5 per cent in those cases which are promptly attended and in which no medicine has been administered by mouth. Drenching of cows suffering from this disease should be rigidly abstained from, since the mortality which follows is exceedingly high, due to portions of the drench passing down the trachea into the lungs. As a prophylactic measure, in case there appears to be any danger of an attack of milk fever, it is now uniformly advised that the udder be inflated at once.

MILKFISH. A large, silvery, herring-like fish of the genus *Chanos* and family Hiodontidæ, which inhabits the warmer parts of the Pacific. One well-known species (*Chanos chanos*), from 2 to 5 feet long, is a food fish of some importance in the south Pacific, Japan, Hawaii, and the Gulf of California. Foreign names for it are chani, awa, auge, sabalo, etc.

MILKING MACHINE. An apparatus designed to do away with hand labor in milking cows. Milking tubes, inserted into the milk ducts within the teats, have been tried, but

found unsatisfactory. Several forms of milking machines have been devised which milk a number of cows at the same time. The most successful of these operate on the principle of a vacuum maintained by a hand or power air pump and so arranged as to give a pulsating action. Pipes connected with the apparatus pass to the stalls and terminate in closed cans fitted with hose and cups, which fit over the cows' teats so as to make an air-tight joint. A pulsating action resembling hand milking or the sucking of the calf is imparted by the vacuum apparatus, alternating in pressure from five to fifteen pounds at quite rapid intervals. In recent years the milking machine has been developed to a quite high state of perfection. Several forms are rapid and effective, but are expensive to install and maintain, and must be thoroughly cleaned or they will soon become foul and contaminate the milk. As yet milking machines have come into only limited use either in America or Europe.

MILK LEG. See PHLEGMASIA ALBA DOLENS.

MILKOWSKI, mil-kôf'skê, ZYGMUNT (1824-1915). A Polish novelist, who wrote under the pseudonym Theodor Thomas Jez. He was born at Saracea in Podolia, and was educated at the Odessa Lyceum and at the University of Kiev, where he made a special study of physics and mathematics. He took an active part in the Hungarian uprising of 1848 and then traveled in the East. After identifying himself with the Polish insurrection of 1863 he was obliged to live abroad. He lived in Zurich and was curator of the Polish museums at Rapperswil. Besides romances founded upon Slavic history he wrote stories of contemporary life in which the manners and customs of the south Slavonians and Hungarians are faithfully portrayed. Among the best of these are *Handzia Zahornicka* (1860); *Szandor Kowacz* (1861); *Historja o praprawnuku i prapradziatku* (1864); *Uskoki* (1870). Among his later works are *Ofiary* (1874); *Herceg Slowianski* (1876); *Narzeczona Harambaszy* (1882); *Rycerz chrzescianski* (1890). Less successful than these were his Polish historical novels, such as *Derslarb z Rytwian* (1872); *Za Króla Olbrachta* (1876); *Z ciezkich dni* (1881).

MILK POWDER. See MILK.

MILK PRODUCTION. In a well-conducted dairy farm the following conditions should be enforced: the stable or cow house should be roomy, clean, dry, light, and well ventilated, for only under such conditions can cows be kept in the best of health. The animals themselves should be clean and healthy and should be well fed and contented. There should be an abundance of pure water, to which the cows should have access at least twice a day. The food should be of good quality and the grain and coarse fodder should be free from dirt and decay and not in a musty condition. All utensils which come in contact with milk should be thoroughly washed and sterilized or scalded after using. After the milk has been drawn from the cow it should be taken to a milk room which is free from all stable and other odors, poured through a fine strainer, and run over a cooling aerator (q.v.), to free it of animal and stable odors and cool it quickly. The milk is next transferred to the shipping can and set in cold water, or bottled and stored in a cold place until needed. During transportation from the farm to the town or city the milk should be kept

as cool as possible. Refrigerator cars are provided by some railroads for that purpose. Much of the milk that is brought to large cities by rail is from 24 to 36 hours old before it reaches the consumer. This makes it necessary to exercise every precaution in its handling, in order to prevent spoiling, and cooling immediately after milking is an important factor in this connection.

Not only has the demand for clean, pure milk increased greatly, but it has led to the enactment of more rigid restrictions and closer supervision of dairies and to the production at some dairies of so-called sanitary milk. Such milk is produced under the most sanitary and hygienic conditions as regards the food and care of the animals, the stables, the milking, and the care and handling of the milk. The herds in these dairies are inspected often to determine their freedom from disease, and not infrequently the milk is "certified" or guaranteed to contain a certain fixed percentage of fat, as 5 per cent, this being maintained the year round by the addition of cream when necessary. Such sanitary or certified milk is usually sold at an advanced price, as the cost of its production is greater than that of ordinary market milk. The so-called modified milk is a prepared product used principally for infant feeding, and usually made according to a physician's prescription. Some physicians prescribe a milk with a definite composition, usually resembling mother's milk as closely as possible, but varying according to the apparent needs of the individual. Such prescription milk is generally prepared from cows' milk by reducing the amount of fat, and more particularly that of proteids, and increasing the proportion of sugar. Lime water is frequently added to reduce the acidity, and at times preparations made from cereals are added.

For the preservation of milk pasteurization is now extensively practiced. Pasteurization consists in heating the milk in closed vessels at from 60° to 65° C. (140° to 150° F.) for about half an hour and then cooling it as quickly as possible by cold water or ice. By this means most of the organisms contained in it are killed, and the milk will keep much longer than when it has not been so treated. Continuous pasteurizers are used in many creameries and large dairies, and there are a variety of small pasteurizers for family use. Where there is any doubt as to the purity of the milk it is much safer to pasteurize that used for children at home. To a certain extent, however, pasteurization may be used to cover up the effects of careless methods, and many people prefer the sanitary milk. In sterilizing milk the liquid is heated to boiling; but this changes the character of the milk, making it less suitable for drinking and giving it a cooked taste. Pasteurization is sufficient for household purposes.

Statistics. According to the returns of the census of 1910, over 20,000,000 cows are kept in the United States for the production of milk. These produce annually nearly 6,000,000,000 gallons of milk. The total value of the milk consumed as such was estimated at \$252,436,757, and of the cream, \$37,655,047. The total value of the milk, cream, and butter fat sold and the butter and cheese made in the United States in 1909 was \$596,413,463.

See also BUTTER; BUTTERMILK; CHEESE; CREAMERY; DAIRYING; WHEY.

MILK SNAKE, or House Snake. A com-

mon widely spread North American colubrine snake, classified as an Eastern variety (*triangulus*) of the Southern king snake (*Oseola*, or *Ophibolus, doliiatus*). It sometimes reaches a length of 4 feet, and its general color above is yellowish gray, with a dorsal series of large blotches, normally 55 in number, and separated by narrow intervals, which are dull chocolate bordered with black. There is also a double row of rounded spots along the sides and a dark band from the eye back to the corner of the mouth. The abdomen is yellowish white, with square black blotches alternating with those above them. This subspecies is abundant in the Middle States and southern Ontario, changing

MILK SNAKE.

southward and west of the Mississippi into other forms of this far-extended and highly variable species. (See KING SNAKE.) Everywhere it is an entirely harmless denizen of fields and gardens, and often comes into barns and outhouses in search of the mice upon which it principally feeds, thereby deserving the protection of farmers. It is swift and agile. Its name milk snake comes from the frequency with which it is seen in dairies or places where milk is kept. It is believed to drink the milk, and there seems to be good evidence that it does so. Another popular belief is that this snake sometimes sucks the milk from the teats of cows, and this belief seems to be founded upon fact, although the occurrence is much less common than some persons believe. See PLATE OF SNAKES, AMERICAN HARMLESS.

MILK SUGAR. See SUGARS.

MILK TEST. See MILK; DAIRYING.

MILKWEED. See ASCLEPIAS.

MILKWEED BUTTERFLY. A cosmopolitan butterfly (*Anosia plexippus*) which is found in nearly all parts of the world where milkweeds (*Asclepias*) grow. It is also known as monarch butterfly. It is a large reddish species, with its wing veins blackened, and its larva is striking in color, being grayish white and yellowish, transversely banded with black, giving it a zebra-like appearance. The chrysalis is delicate pale green with bright golden spots, and hangs from the leaves or stems of the food plant. The milkweed butterfly is a famous species for several reasons. It is one of the strongest flyers known among the Lepidoptera; specimens have been taken on vessels many hundreds of miles from the land, and there is in the United States an annual migration northward in the spring from the States bordering on the Gulf of Mexico. (See MIGRATION OF ANIMALS.) These flights, aided by the south winds, may reach up into Canada, the butterflies occasionally alighting and laying their eggs upon the milkweeds. In the autumn there is a return migration south, and the butterflies hibernate only in the Southern States, hidden away beneath the bark of trees and in other protected places.

Ordinarily the butterflies frequent open ground, but when they congregate, as at night and in cloudy weather, they are found resting on the stems of herbaceous plants, usually in the open spaces of forests, and in enormous num-

bers. They will alight upon the lee side of a tree, and particularly on the lower branches, in such vast numbers as almost to hide the foliage and to give their color to the trees. If disturbed, they rise like a flock of birds, but immediately settle again. Sometimes a tree will be so festooned with butterflies that it appears, at a short distance, to be covered with dead leaves.

This butterfly is one of the especially protected species, and is provided with scent scales, "androconia," which are supposed to make the insect distasteful to its natural enemies. It is the commonest and most widespread representative of the large group of butterflies which are thus protected, and is mimicked in coloration by other nonprotected species, e.g., in the United States by *Basilarchia disippus*, or *archippus*. Consult S. H. Scudder, *The Life of the Butterfly* (New York, 1893). See BUTTERFLIES AND MOTHS; MIMICRY; VICEROY.

MILKWORT. A plant common in the north temperate zone. See POLYGALA.

MILKY WAY. See GALAXY.

MILL (AS. *mylen*, *myln*, from Lat. *molina*, mill, from *mola*, millstone, from *molere*, to grind; connected with Eng. *meal*, mold). A name originally given to machinery for grinding grain for food or to the factory where this was done. The term is now applied in a general way to many other kinds of manufactories besides those where raw material is transformed by a grinding process, as a saw mill, planing mill, or cotton mill. It is also applied in a special sense to a steel rotating cutter for shaping raw material or metal stock. See FLOUR; ROLLING MILL; GRINDING, CRUSHING, AND PULVERIZING MACHINERY.

MILL, HUGH ROBERT (1861–). A Scottish geographer, born at Thurso (Caithness) and educated at Edinburgh University, where he received the degree of D.Sc. in 1886. He served as chemist and physicist to the Scottish Marine Station (1884–87), was a university-extension lecturer (1887–1900), and after 1900 edited *British Rainfall* and *Symons's Meteorological Magazine*. In 1901 he was president of Section E of the British Association and in 1907–08 president of the Royal Meteorological Society. He became chairman of the trustees and director of the British Rainfall Organization. His writings include: *Realm of Nature* (1892; new ed., 1913); *The Clyde Sea Area*; *the English Lakes* (1895); *Hints on the Choice of Geographical Books* (1897); *New Lands* (1900); *The Siege of the South Pole* (1905); besides many articles. He became best known perhaps as the editor of *The International Geography* (new ed., 1911).

MILL, JAMES (1773–1836). A British economist and philosopher. He was the son of a shoemaker, and was born near Montrose, Scotland, April 6, 1773. He studied at the University of Edinburgh, where he distinguished himself in Greek and in moral and metaphysical philosophy. He was licensed to preach in 1798, but instead of following this career he went to London in 1802 as tutor to Sir John Stuart's children and there settled as a literary man. He became editor of the *Literary Journal* and of the *St. James's Chronicle* and wrote for various periodicals. Not long after he was established in London he made the acquaintance of Jeremy Bentham, who influenced him greatly in his views. In 1806 he commenced his *History of British India*, which he carried on along with

other literary work and published in the winter of 1817-18. This important work, though containing an attack upon the administration of the East India Company, secured for him in 1819 the post of assistant examiner of Indian correspondence. Before his death he was appointed head of the examiner's office, where he had the control of all the departments of Indian administration—political, judicial, and financial—managed by the secret committee of the court of directors. He contributed many important articles to the *Encyclopædia Britannica* (1814). Some of these essays were printed in a separate form and became widely known. In 1821-22 he published his *Elements of Political Economy*, a work prepared primarily with a view to the education of his eldest son, John Stuart Mill. In 1829 his magnum opus, the *Analysis of the Human Mind*, appeared. The work is almost the Bible of associationism and deserves to be classed among the great English philosophical productions. He attempted to simplify associationism by recognizing only one principle at work—that which was later called association by contiguity. (See ASSOCIATION OF IDEAS.) This principle can so fuse various ideas and feelings that a result may be produced entirely different from the original element. This has been called mental chemistry. In his *Fragment on Mackintosh* (1835) Mill made great use of mental chemistry in support of the doctrine that morality is based on utility. (See UTILITARIANISM.) In this way he furnished a psychological basis for Bentham's ethical and legislative reforms. He took great interest in political questions and was a powerful advocate of an extended suffrage. Much of his influence was due to his strong personality and great conversational powers. In later life he entirely broke away from his early religious views and brought up his son John Stuart in utter religious indifference. He took a leading part in the founding of University College, London. He died at Kensington, June 23, 1836. Consult: J. S. Mill, *Autobiography* (London, 1873; new ed., ib., 1908); Alexander Bain, *James Mill: A Biography* (ib., 1882); Sir Leslie Stephen, *The English Utilitarians*, vol. ii (New York, 1900).

MILL, JOHN (1645-1707). A scholar of the Church of England. He was born at Shap, Westmoreland, studied at Queen's College, Oxford, and was elected a fellow in 1670. He entered the ministry and became distinguished as a preacher; he became rector in 1681 of the college living of Bletchington, Oxfordshire, and chaplain to Charles II. In 1685 he was principal of St. Edmund Hall and in 1704 became prebendary of Canterbury. The work for which he is most distinguished is his new edition of the Greek Testament, on which he spent 30 years and which appeared only 14 days before his death. It was undertaken at the advice and expense of Dr. Fell, Bishop of Oxford, but after the Bishop's death (1686) Mill continued it at his own expense and repaid to the executors what he had received. The text which Mill adopted is that of Robert Stephens of 1550, and his work contains 30,000 various readings collected from manuscripts, commentaries, writings of the fathers, etc. Dr. Daniel Whitby attacked the work in his *Examen Variantium Lectionum Johannis Millii* (London, 1709); but Dr. Richard Bentley approved the labors of Mill, and Michaelis, Marsh, and other critical scholars acknowledged the value of the edition.

MILL, JOHN STUART (1806-73). An English philosopher, the son of James Mill. He was born in London, May 20, 1806, and was educated at home by his father, who gave his precocious son an extraordinary amount of learning at a very early age. He is said to have begun Greek at three. He was never allowed to indulge in the plays of childhood. In 1820 he went to France, where he lived for upward of a year, making himself master of the French language and occasionally attending public lectures on science, but also, now that he was away from his father, getting some physical exercise in fencing and like sports. This stay in France gave him an intense appreciation for the pleasures of travel, and to the end of his days he was an ardent lover of mountain scenery. But the world of men had also its interest for him while he was abroad, for then he laid the foundation of his great familiarity with and interest in the politics as well as the literature of the French nation. On his return he read law, history, and philosophy, and in 1823 entered the India House as a clerk in the examiner's office, where his father was assistant examiner. For 33 years he was in the service of this company, gradually rising till at last he was head of his department, as his father had been before him. When the government of India was transferred to the crown in 1858, he declined a seat on the New Indian Council and retired from office in October of the same year, on a compensating allowance. At the general election of 1865 Mill was returned to Parliament for Westminster, and till he lost his seat at the election of 1868 he acted with the advanced Radicals and urged the extension of suffrage to women. In 1851 he married Mrs. John Taylor, who had been an intimate friend long before her first husband's death. He ascribed to her influence many of his most cherished ideals; she died in 1859, but Mill's devotion to her memory was his religion till his death, which took place May 8, 1873, at Avignon, where he had spent the greater part of the last years of his life.

Mill became an author at a very early age and may be looked upon as one of the foremost thinkers of his time. His first publications consisted of articles in the *Westminster Review*. He took an active part in the political discussions that followed the revolution of 1830 in France and the reform-bill movement in England; and from 1835 to 1840 was editor and, along with Sir W. Molesworth, proprietor, of the *London and Westminster Review*, where many articles of his own appeared. His chief works are: *A System of Logic, Ratiocinative and Inductive* (1843; 9th ed., 1875); *Principles of Political Economy* (1848; ed. by Ashley, 1909); *On Liberty* (1859); *Discussions and Dissertations* (4 vols., 1859-74); *Utilitarianism* (1863); *Comte and Positivism and the Examination of Sir William Hamilton's Philosophy* (1865); *Inaugural Address at the University of St. Andrews* (1867); *England and Ireland* (1868); *The Subjection of Women* (1869); *Chapters and Speeches on the Irish Land Question* (1870). He also edited with copious notes his father's *Analysis of the Phenomena of a Human Mind* (London, 1869). After his death appeared his *Autobiography* (1873) and *Three Essays on Religion* (1874). A collected edition of his works appeared in 1905-10. Two volumes of his *Letters* also appeared in 1910. In philosophy he was an empiricist, sensationalist, and asso-

ciationist. In ethics he was a utilitarian, but departed from the utilitarianism of Bentham by recognizing differences in quality as well as in quantity of pleasures. "It is quite compatible," he says, "with the principle of utility to recognize the fact that some kinds of pleasure are more desirable and more valuable than others. It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied." Experience determines the rank of pleasures in the scale of quality; on this point he, perhaps unconsciously, follows Plato, assuming, contrary to fact, that experience gives the same valuation in all cases. In political theory Mill was a modified individualist, believing that every man should be allowed all liberty compatible with the liberty of his fellows. The tendency of modern thought has been so far away from individualistic standards that Mill's renown has been somewhat obscured, but his influence on his own generation would be difficult to overestimate. In metaphysics he followed the Humean tradition: the mind is "a series of feelings which is aware of itself as past and future," and matter is "the permanent possibility of sensations." His greatest work, however, was in logic, to which he added a fruitful treatment of the subject of induction (q.v.). His work in this science was considerably impaired by his sensationalistic empiricism, but when everything is taken into account, it must stand alongside that of Aristotle and of Hegel. His book was for many years the standard authority among those who shared his general standpoint in questions of philosophy, though it was keenly criticized from the opposite camp by Whewell and W. G. Ward.

Mill*, in Green's *Works*, vol. ii (ib., 1886); Theodor Gomperz, *J. S. Mill* (Vienna, 1889); W. L. Courtney, *Life of J. S. Mill* (London, 1889); Charles Douglas, *John Stuart Mill, a Study of his Philosophy* (ib., 1895); id., *The Ethics of John Stuart Mill* (ib., 1897); John Watson, *Comte, Mill, and Spencer* (New York, 1895; subsequently revised and renamed *An Outline of Philosophy*, Glasgow, 1898); Sir Leslie Stephen, *The English Utilitarians*, vol. iii (New York, 1900); Ernest Albee, *History of English Utilitarianism* (London, 1902); Thomas Whittaker, *Comte and Mill* (New York, 1909); John MacCunn, "The Utilitarian Optimism of John Stuart Mill," in *Six Radical Thinkers* (ib., 1910); S. P. Cadman, "John Stuart Mill," in *Charles Darwin and Other English Thinkers* (Boston, 1911); A. S. Pringle Pattison, *English Philosophers and Schools of Philosophy*, in "Channels of English Literature Series" (New York, 1912). Douglas's two works are especially to be commended to the reader who wishes to get in compact form a statement of Mill's doctrines in his own words. See POLITICAL ECONOMY.

MILLAIS, mil-lä', SIR JOHN EVERETT (1829-96). An English genre, landscape, and portrait painter. He was born at Southampton, June 8, 1829, and was brought up in the Isle of Jersey. In 1837 he received his first instruction in art from Bessel, a drawing teacher in Jersey. In 1838 and 1839 he studied at the School of Henry Sass in Bloomsbury, and the following years at the Royal Academy, in which he carried off

every prize, receiving a gold medal in 1847. In 1848 he became associated with William Holman Hunt, Dante Gabriel Rossetti, and others in the formation of the Pre-Raphaelite Brotherhood (q.v.). His work attracted the attention of Ruskin, for whom he made some architectural designs and whose portrait he painted. In 1855 he married Ruskin's divorced wife. He was made associate member of the Royal Academy in 1853 and member in 1863. From 1860 to 1870 he was employed as illustrator, and among other books illustrated Tennyson's poems and Trollope's novels. He was appointed Officer of the Legion of Honor at the Paris Exposition in 1878 and was an honorary member of the French Institute and of several foreign academies. He was created Baronet in 1885, and a few months before his death, which occurred in London, Aug. 13, 1896, he was made president of the Royal Academy.

Aside from his landscapes and portraits, his subjects include scriptural, historical, and legendary themes, scenes from everyday life, and a few national in character, such as "The Rescue" (1855), painted in honor of the London firemen. From 1847 to 1853 his work was strongly influenced by Pre-Raphaelite theories and aroused much criticism. Works of this period are: "Isabella" (1849, Liverpool Gallery); "Christ in the House of his Parents" (1850) and "Ophelia" (1852, both in the Tate Gallery); "The Proscribed Royalist" (1853); "The Huguenot" (1852). After 1855 his work developed greater individuality and breadth, but lost in intensity, and his composition became more commonplace. His landscapes betray the ardent nature lover; his portraits are painted with masterly characterization. His art is forceful and robust, and his color brilliant. From 1870 on he gave much of his time to portrait painting, his sitters including Gladstone (National Gallery and Christ Church, Oxford); Leech, Lord Beaconsfield, Wilkie Collins, and Carlyle (all in the National Portrait Gallery); John Bright, Irving, Tennyson (Tate Gallery), and others. His landscapes include: "Spring" (1859); "Chill October" (1871); "The Vale of Rest" (1859, Tate Gallery); "Dew-Drenched Furze" (1881). Other important pictures are: "Eve of St. Agnes" (1863, water color, South Kensington Museum); "Effie Deans"; "The Black Brunswicker" (1860); "The Bride of Lammermoor" (1878) and "Portia" (both in the Metropolitan Museum, New York); "The Blind Girl" (1856, Birmingham Gallery); "The Northwest Passage" (1874); "The Order of Release" (1853); "The Boyhood of Raleigh" (1879); "A Yeoman of the Guard" (1877); "St. Stephen" (1895); "Speak! Speak!" (1895), and "A Disciple" (1895, all in the Tate Gallery).

Bibliography. Spielmann, *Millais and his Works* (London, 1898); J. G. Millais, *Millais' Life and Letters* (ib., 1899); A. L. Baldry, *Millais: His Art and Influence* (ib., 1899); Bayliss, *Five Great Painters of the Victorian Era* (ib., 1902); *Masters in Art*, vol. ix (Boston, 1908); T. L. Hare, in *Leaders of English Pre-Raphaelites* (New York, 1909); J. E. Reid, *Sir J. E. Millais* (ib., 1909).

MILLAIS, JOHN GAILLE (1865-). An English artist and naturalist, born in London, a son of Sir John Everett Millais. He was educated at Marlborough and at Trinity College, Cambridge, and from 1886 to 1892, when he retired as first lieutenant, served in the

Seventy-second Highlanders. He shot big game in all parts of the world and made a remarkably large collection of British birds. Besides illustrating books on shooting and natural history, especially the *Encyclopædia of Sport*, to which he contributed, he wrote: *Game Birds and Shooting Sketches* (1892); *A Breath from the Veldt* (1895); *British Deer and their Horns* (1897); *the Life and Letters* (1899) of his father; *The Wild Fowler in Scotland* (1901); *British Surface-Feeding Ducks* (1902); *The Mammals of Great Britain and Ireland* (3 vols., 1904-06); *Newfoundland and its Untrodden Ways* (1907); an elaborate and beautifully illustrated *Natural History of British Game Birds* (1909); *British Diving Ducks* (1913); *Deer and Deer Stalking* (1913).

MILLAR, ANDREW (1707-68). A London publisher and bookseller, of whom Dr. Johnson said: "I respect Millar, sir; he has raised the price of literature." It was he who, with other aid, financed Johnson's *Dictionary* and saw it through the press. Among his notable publications were Thompson's *Seasons*, Fielding's *Tom Jones* and *Amelia*, and the histories of Robertson and Hume. Consult Charles Knight, *Shadows of the Old Booksellers* (London, 1865).

MILLARD, EVELYN (1873-). An English actress, born in London, the daughter of a professor of elocution. She made her début at the Haymarket in 1891 and in the same year played in Sarah Thorne's stock company and in repertoire with Fred Thorne's company. Then she was at the Adelphi (through 1893); played Paula in *Mrs. Tanqueray*; with Comyns Carr as Rosamund in *Sowing the Wind* (1895); at the St. James's (1894-96), playing Cecily Cardew in Wilde's *The Importance of Being Earnest* and Princess Flavia in *The Prisoner of Zenda*; and at Her Majesty's (1896) she created the rôle of Mademoiselle de Belle Isle in 1897. She was Portia in Beerbohm Tree's production of *Julius Cæsar* (1898); Glory Quayle in Hall Caine's *Christian* (1899); Francesca in Stephen Philip's *Paolo and Francesca* (1902); the Countess de Roquelaure in Doyle's *Brigadier Gerard* at the Lyric (1906); and Joanna Rushworth in *The Beloved Vagabond* at His Majesty's (1908). In 1908 she managed the Garrick. She married Robert Porter Coulter in 1900.

MILLAU, mè'yô', or MILHAU. A town in the Department of Aveyron, France, on the Tarn, 74 miles north of Béziers (Map: France, S., G 4). Its chief building is the Romanesque church of Notre Dame, with a sixteenth century tower. There is a large botanical garden and parks. The town is the centre of a cattle-raising and grape-growing section and has a variety of manufactures, particularly of kid gloves, woolen goods, and dyed goods. There are oil wells near by. Millau was the Roman *Æmilianum Castrum*; during the religious wars it was a stronghold of Calvinism, and Louis XIII destroyed its ancient castle and walls in 1629. Pop. (commune), 1901, 18,701; 1911, 17,673.

MILLBANK PRISON. A famous London penitentiary in Westminster, facing the Thames. It was built in 1812 (finished in 1821) in accordance with the plans of Howard and Bentham. It could shelter 1100 inmates and was so constructed that from a central room every cell could be seen. The confinement was solitary. Those sentenced to penal servitude served a term here first. The prison was closed in 1890 and the buildings torn down in 1891. Consult G. P.

Holford, *Account of the General Penitentiary at Millbank* (London, 1828), and A. Griffiths, *Memorials of Millbank* (2d ed., ib., 1894).

MILL-BOY OF THE SLASHES. A popular nickname of Henry Clay, from a tract of swampy land called the Slashes near his birthplace in Hanover Co., Va.

MILLBURY. A town in Worcester Co., Mass., 6 miles southeast of Worcester, on the Blackstone River and on the New York, New Haven, and Hartford and the Boston and Albany railroads (Map: Massachusetts, D 4). It has a public library and is extensively engaged in the manufacture of cotton and woolen goods, edge tools, foundry and machine-shop products, loom harness and heddles, linen cloth and thread, and felt goods. From 1743 to 1813, when it was incorporated, Millbury was the north parish of Sutton. The lyceum lecture system is said to have originated here about 1820. Pop., 1900, 4460; 1910, 4740.

MILLE, mèl, PIERRE (1864-). A French journalist and author, born at Choisy-le-Roi and educated at the Collège Rollin. He was sent to Madagascar on several missions; was war correspondent for the *Journal des Débats* during the Græco-Turkish War in 1897; and traveled widely. He was created a Knight of the Legion of Honor. Among his writings are: *De Thessalie en Crète* (1898); *Au Congo belge* (1899); *Sur la vaste terre* (1906); *La biche écrasée* (1910); *Caillou et Tili* (1911); *Louise et Barnavaux* (1912).

MILLEDGE, JOHN (1757-1818). An American soldier and statesman, born in Savannah, Ga. When the Revolution began he was one of the party which seized Wright, the royal Governor of the Colony. Milledge escaped from Savannah when it was taken by the British in 1778, and he assisted in the unsuccessful siege of the town by the Americans in 1779. In the following year he was made Attorney-General of Georgia. After the war he was several times elected a member of the State Legislature, and was a Representative in Congress from 1792 to 1798 and again from 1801 to 1802, when he resigned to become Governor. In 1802 he was one of the three commissioners who negotiated the cession of Georgia's western territory to the United States. From 1806 to 1809 he was a United States Senator. Milledge took an active part in establishing the University of Georgia, and gave the institution 700 acres of land, upon which the university and a part of Athens now stand. The town of Milledgeville was named in his honor.

MILLEDGEVILLE. A city and the county seat of Baldwin Co., Ga., 32 miles northeast of Macon, on the Oconee River, at the head of navigation, and on the Georgia and the Central of Georgia railroads (Map: Georgia, C 2). It is the seat of the Georgia Military College and the Georgia Normal and Industrial College for Girls and of the Georgia State Sanitarium for the Insane, which accommodates 4000 patients. The prison farm, 3 miles northwest of the city, employs some 400 State convicts. The city is the centre of a cotton-growing region and its industrial interests are mainly in the preparation of this staple for market, and in the manufacture of brick, tile, cement, and sewer pipe. The government, under a charter of 1900, is administered by a mayor, elected every two years, and a unicameral council, of which the mayor is a member, chosen on a general ticket. Mil-

ledgeville, named in honor of Gov. John Milledge of Georgia, was laid out in 1803, was chartered as a city in 1836, and was the capital of the State from 1807 to 1867, the government buildings now being utilized by the colleges. Pop., 1900, 4219; 1910, 4385.

MILLENA'RIANS. See MILLENNIUM.

MIL'LENARY (Lat. *millenarius*, containing a thousand, from *milleni*, a thousand each, from *mille*, thousand). A period of a thousand years, specifically the celebration of the one-thousandth anniversary of any event. The most important millenary was that commemorating the death of Alfred the Great, which was held in Winchester, England, Sept. 18-21, 1901, which culminated in the unveiling of a large bronze statue of King Alfred by Hamo Thornycroft.

MILLENNARY PETITION. A petition presented by Puritan clergy to King James I in April, 1603, when on his way to London to take his throne. It is so called because it was intended to have 1000 signatures, although as a matter of fact it had only 750. The original of the petition is supposed to be lost, but Fuller gives it in his *Church History* (Book x, 27, ed., London, 1837, vol. iii), and it is thence reprinted by Gee and Hardy, *Documents Illustrative of English Church History* (London, 1896; pp. 508-511). It sets forth in firm but respectful language those points connected with the Church service (cross in baptism, baptism by women, public reading of the Apocrypha, unabridged liturgy, etc.), the Church ministry (il-literate ministers, nonresidency, clerical celibacy), the Church revenue (commendams, pluralities, impropriations), and with the Church discipline (excommunications for trifling causes, extortionate fees, protracted ecclesiastical suits, frequency of marriages without banns asked), which the Puritan party would see removed or modified. The King's answer was the calling of the Hampton Court Conference in January, 1604, which resulted in no redress, but rather the confirmation of the abuses complained of, but which led to the preparation of the Authorized Version of the Bible.

MILLEN'NIUM (Neo-Lat., from Lat. *mille*, thousand + *annus*, year). A period of 1000 years preceding the final judgment (q.v.), during which, according to a widely accepted system of Christian eschatology, the Christ and his saints will reign on the earth. The division of the world's course into periods is found among many peoples. Thus, the Hindus divided the history of the world into *kalpas* of hundreds or thousands of years, and the Incas made four great periods. (See ESCHATOLOGY.) A long national existence and a tradition of certain epoch-making events naturally account for such a partition. The Persians counted 12 periods each of 1000 years. It is likely that this division into 12 parts was derived from the Babylonians, and ultimately goes back to calculations of the sun's course through the 12 signs of the zodiac. It is significant that the third, fourth, fifth, sixth, seventh, and eighth thousand years are attributed respectively to Cancer, Leo, Virgo, Libra, Scorpio, and Sagittarius in *Bundahish* 34. The number 1000 may have a different origin, since the great cosmic year would demand a larger figure. According to the Parsi doctrine, 6000 of the 12,000 years are occupied by the history of man. Zarathustra appears at the beginning of the fourth and the Saoshyant will come at the end of the last to raise the dead and

to renew the world. While this doctrine is fully presented only in late Pahlavi writings, such as the *Bundahish* and the *Dinkart*, there are indications of a much higher age, as Mani (c.200 A.D.) was familiar with the Zoroastrian doctrine of a cycle of 12,000 years, and Berosus (c.300 B.C.) seems to have rationalized the doctrine of *Zrvan akarana*, boundless time, and its period. It is altogether probable that the conception that human history would endure 6000 years before the Messianic age came into Jewish thought from a Persian source. The scriptural justification was found in Ps. xc. 4, "A thousand years in thy sight are but as yesterday when it is past," and the length of the Messianic age was inferred from an interpretation of Gen. ii. 2, based on the word of the Psalmist, as is seen by utterances of rabbis living in the second century A.D. (*Midrash Tehillim* to Ps. xc and *Yalkut Shimeoni* to Ps. lxxii.) Before the fall of Jerusalem in 70 A.D. there is no evidence that the expected Jewish world empire, whether with or without a Messiah, was thought of as being of limited duration. That Israel would never yield its supremacy to any other nation was a firm conviction. The Messianic King was probably looked upon as the founder of a dynasty. Towards the end of the first century, however, the conception of the Messiah became more transcendent, and his reign might be thought to last "until the corruption of the world should end," characterized by great prosperity (*Apocalypse of Baruch*, xl. 3, xxix, lxxiii), or, more precisely, 400 years to be followed by seven days of silence, the general resurrection, and the last judgment (q.v.) as set forth in the *Apocalypse of Ezra* (vii. 28, 29). The first mention of the millennium is in the *Slavonic Enoch* (xxxii. 2-xxxiii. 2); but in this book there is no Messiah. A summary of opinions in the Babylonian Talmud (*Sanhedrin* 97a, 99a) shows that it was comparatively seldom that a Jewish teacher estimated at 1000 years the length of Yahwe's reign, 40, 70, 365, 400, 600, 2000, and 7000 years being suggested by different teachers.

In the New Testament the doctrine of a millennium is clearly taught in Rev. xx. After the returned Messiah has conquered the beast, Satan is cast into the abyss in chains for 1000 years, the martyrs are raised from the dead and reign with Christ as kings and priests during the millennium. At the end of the millennium the powers of evil are let loose again for a short time, whereupon follow the resurrection of the rest of the dead, the last judgment, the destruction of death and Hades, which is the second death, and the new heavens and the new earth. Critical exegesis agrees with the Chiliasts of the early Church and the present premillenarians that the author of this passage no doubt believed that Jesus would return upon the clouds before the millennium to reign with some of his saints for 1000 years in visible form. It cannot be proven, however, that other writers in the New Testament cherished this view, or that they all held the same opinion concerning the world's future. The Gnostics rejected this doctrine and their opposition was continued by such teachers of the Alexandrian school as Clement and Origen. On the other hand, Irenæus informs us (*Adv. Haer.*, v, 33) that Papias, Bishop of Hierapolis, had recorded as a saying of Jesus a remarkable description of the fertility of the vine in the millennium; the epistle attributed to Barnabas describes the millennium as a period of

rest following 6000 years of work to be ushered in by the return of Christ (xv, 5); and Justin Martyr likewise expressed his belief in the pre-millennial coming of Christ and the thousand years of his reign in Jerusalem (*Apol.* 52; *c. Tryph.* 45, 49, 113). Irenæus, Tertullian, and Hippolytus were also Chiliasts. An ardent expectation of the millennial kingdom characterized the Montanists, who looked for its establishment at Pepuza in Phrygia. The reaction against Montanism led to a more general rejection of the doctrine of a millennium. Dionysius of Alexandria attacked the very foundation of this doctrine in denying the Johannine authorship of Revelation. Such doubts did not disturb the Western Church, and men like Commodian and Lactantius were Chiliasts. Only through the influence of Jerome and especially Augustine, whose *Civitas Dei* identified the Church with the kingdom of God and the millennium with the history of the Church, did Latin Christianity commit itself to an eschatological programme excluding the premillennial advent, the first resurrection, and the visible reign on earth. During the Middle Ages earnest and spiritually minded men, grieved at the many abuses that spread in the Church, could not but look for divine chastisement. While there does not seem to be sufficient foundation for the current statement that the end of the world was generally expected about the year 1000 A.D., there are many indications of the anxiety that at sundry times filled pious hearts as well as guilty consciences. The great hymn *Dies iræ, dies illa* reveals both a fearful looking forward to the impending judgment and the part that the Sibylline Oracles and similar works played in creating this mood. Millenarian views were held by men like Joachim of Floris and Occam and by numerous religious bodies. In the Reformation era the hope of a speedy establishment of the Messianic kingdom was especially cherished by many of the Baptists. They were led to it by their doctrine of the inner light and the continuance of prophecy, by their sympathy with the oppressed, and by their disapproval of the union of church and state. Looking to God alone for the establishment of the truth and the righting of social wrongs, and expecting a direct revelation from Him, some naturally were led astray by their impulses under pressure of circumstances. But the establishment of the millennial kingdom by John of Leyden (q.v.) at Münster was an error regretted and condemned by the great majority of Baptists. The Fifth Monarchy men of Cromwell's time looked upon the millennium as having actually begun with the overthrow of the royal family in England. Many English mystics looked forward to the second advent in the year 1666, and their faith found a curious reflection even in Judaism. (See MESSIAH.) Chiliastic views were embraced by Comenius, who translated into Latin a number of recent prophecies as to the end of the world, Jurieu, Spener, and other pietists. Swedenborg held that the millennial dispensation began in 1757. Bengel calculated that the millennium would commence in 1836; Miller expected it in 1843; Channing in 1867; Baxter in 1881. While some premillenarians devote much attention to prophetic chronology, assuming a double fulfillment of the predictions in Daniel and Revelation, others refrain from all attempts at fixing the date, but are obliged by the natural interpretation of Rev. xx, with their view of biblical infallibility,

to affirm the visible coming of Christ before the millennium. Among the latter are many learned theologians of recent times. The opinion that this visible coming of Christ will occur after a long period of universal prevalence of Christianity supposed to be vaguely indicated by the thousand years is more widely accepted, but it is further removed from the conceptions of early Christianity and cannot readily find the scriptural support that it demands. The distinction between premillennialism and postmillennialism is rapidly losing its significance, as modern theology has a tendency to look upon the primitive Christian expectation of the return of Jesus as an illusion, historically necessary, but not of permanent worth; to consider the absolute victory of one system of religious faith and practice less desirable than the ascendancy of what is morally most excellent in all creeds and cults; and to expect a gradual improvement of the social conditions and the character of the human race to be wrought by actually operating forces.

MILLEPORE (from Lat. *mille*, thousand + *porus*, passage, pore). A coral-forming hydroid, of the order Hydrocorallina, so named from the numerous minute pores or calices dotting its surface, which are arranged in irregular circular groups. As the single animal is microscopic, and as it grows in compound coral-like masses on reefs in tropical seas, it was at first confounded with the corals, but was eliminated from the corals first by L. Agassiz and afterward by Moseley. The animal is not a coral polyp, being allied rather to *Hydra*, and especially to *Hydractinia* and *Clava*, common on northern coasts. The coral stocks form irregular branching masses, several inches high and sometimes a

foot or more broad. The mass of the coral incrustation consists of fibres (canals or tubes) traversed in all directions by tortuous spaces forming regular branching systems, like a tree, in which *Millepora* differs from the coral stocks (coralla). The animals are of two kinds. Those inhabiting the central cup or pore are short thick zooids. (See POLYMORPHISM.) These are the "feelers"—they take in the food. The zooids in the smaller, outer pores of the circle are the reproductive zooids. That *Millepora* is a true hydroid is proved by the coral stock being at the base provided with canals by which the several zooids are kept in union with one another by the form of the zooids themselves, by the absence of all trace of mesenteries (which characterize coral polyps), and by the presence

MILLEPORA.

Animal of *Millepora nodosa*. a, nutritive zooid; b, reproductive zooid; c, lasso cell; d, the same coiled up in its cell; e, a third form. (All highly magnified.)

of thread cells (see NEMATOCYST) of the form peculiar to hydroids. Finally, the position of *Millepora* as a hydroid has been satisfactorily settled by the discovery, by Duerden in 1899, in Jamaica, of free-swimming female medusae. (See HYDROZOA.) The Floridian and West Indian species is *Millepora alcicornis*. Consult articles by L. Agassiz, Moseley, Duerden, in *Nature* (London, 1899-1900). See Plate of CORAL.

MILLER, ADOLPH CASPAR (1866-). An American economist, born in San Francisco. He graduated from the University of California in 1887 and from Harvard (A.M.) in 1888 and studied at Paris and Munich in 1895-96. He was instructor in economics at Harvard in 1889-90, assistant professor of history and politics at the University of California in 1890-91, associate professor of political economy and finance at Cornell in 1891-92, professor of finance at Chicago from 1892 to 1902, and Flood professor of economics and commerce at the University of California in 1902-13. In the latter year he became assistant to the Secretary of the Interior at Washington and in 1914 he was appointed by President Wilson a member of the newly created Federal Reserve Board. He published *The Monetary Problem in the United States* (1895).

MILLER, CHARLES (1843-). An American capitalist and philanthropist, born at Oberhoffen, Alsace. He came to the United States in 1854; entered the oil business in 1869; and became president of the Galena-Signal Oil Company and director of the American Locomotive Company, the American Steel Foundry Com-

pany, the Railway Steel Spring Company, and about 40 other corporations. He served as mayor of Franklin, Pa., for two terms, as member of the Pennsylvania State Board of Charities for six years, and as major general in the Pennsylvania National Guard in 1900-06. He maintained a night school at Franklin, and was made a Chevalier of the French Legion of Honor.

MILLER, CHARLES HENRY (1842-1922). An American landscape painter, born in New York City. He first studied to be a physician, but gave up this profession for art. After studying in Vienna and Berlin he went to Munich in 1867 and became a pupil of Lieber and of the Bavarian Academy. Afterward he settled in New York, where he became an Academician in 1875 and one of the first members of the Society of American Artists. He belongs to the older school of American painters. His best canvases include "Sunset, East Hampton" (1878, Brooklyn Museum); "Bouquet of Oaks" (Metropolitan Museum, New York); "High Bridge" (Democratic Club, New York). He wrote *The Philosophy of Art in America* (1885) under the pen name of Carl de Muldor.

MILLER, CHARLES RANSOM (1849-1922). An American newspaper editor. He was born at Hanover, N. H., and graduated from Dartmouth College in 1872. He served on the staff of the *Springfield Republican* in 1872-75, and then joined the staff of the *New York Times*, becoming an editorial writer in 1881 and editor in chief in 1883. He also became vice president and director of the *New York Times Company*. In 1913 he was special lecturer at the Columbia School of Journalism. He received the honorary degree of LL.D. from Dartmouth in 1905, and that of Litt.D. from Columbia in 1915. His brilliant leader of Dec. 15, 1914, "For the German People, Peace with Freedom," demanding the overthrow of German militarism, was widely commented on at home and abroad, and, in general, the editorial page of the *Times* was maintained under his direction at a high level of excellence during a long period.

MILLER, CININNATUS HEINE, better known as JOAQUIN MILLER (1841-1913). An American author, born in Wabash District of Indiana, Nov. 10, 1841. In 1854 his parents took him to Oregon. Later he became a gold miner in California. He was a volunteer in Walker's Nicaragua expedition of 1855. From 1855 until 1860 he lived among the Indians of the Pacific coast. He studied law for a while, then edited at Eugene, Oreg., a Democratic paper, which was suppressed by the authorities for disunion sentiments. In 1863 he began to practice law and in 1870 he was appointed county judge of Grant Co., Oreg. After visiting the Eastern States Miller went to England, where (and also in Boston) in 1871 he published his *Songs of the Sierras*, which made him a "lion" in London society. In London he lived up to the British conception of the American Western type by appearing on festal occasions and in general in flannel shirt, sombrero, etc. He afterward settled in New York, but left that city in order to do journalistic work in Washington, D. C., and in Oakland, Cal. At his Oakland home, which was a feature of the city, he entertained many visiting celebrities. He died Feb. 17, 1913. In accordance with his wish his body was cremated and the ashes carried up into the Sierras and thrown to the winds. In addition to the *Songs of the Sierras* above mentioned, his

work includes: *Songs of the Sunlands* (1873); *Songs of Italy* (1878); *Songs of the Mexican Seas* (1887); *Building of the City Beautiful* (1893); in prose, *The Danites in the Sierras* (a novel, 1881). Miller's play, *The Danites*, taken from his novel, had considerable success, and his poetry received some favorable notice, more for genuinely romantic content and brilliant if crude color, than for artistic excellence. A collective edition of his verses appeared in 1897. The name Joaquin is supposed to have been taken from Joaquin Murietta, a Mexican bandit, of whom Miller wrote a defense. In the *Poems* (6 vols., San Francisco, 1909-10) will be found (in volume i) an introduction and an autobiography.

MILLER, EDWARD (1760-1812). An American physician, born in Dover, Del. He graduated from the medical department of the University of Pennsylvania in 1784 and in 1797, associated with Dr. Samuel L. Mitchell (q.v.) and Dr. Elihu H. Smith, he founded the *Medical Repository*, the first American journal of medicine. He was professor of the practice of medicine in the University of the City of New York in 1807-12. His report on "Yellow Fever in New York in 1805" remains a notable contribution to medical science. He enjoyed a high reputation both in the United States and abroad. Consult Samuel Miller, *Memoir and Writings of Edward Miller* (New York, 1814).

MILLER, FERDINAND, BARON VON (1842-). A German bronze founder and sculptor. He was born in Munich and studied under his father, Ferdinand von Miller (q.v.), and later with Hähnel in Dresden. For purposes of work and study he traveled extensively in France, Italy, and America. As lieutenant he served in the Franco-German War of 1870-71. In 1900 he was appointed director of the Bavarian Academy of Fine Arts and in 1912 he was made Baron. He cast upward of 70 colossal monuments, scattered throughout the world. His own work in sculpture includes statues of Humboldt, Shakespeare, and Columbus for St. Louis; figures for a large fountain at Cincinnati; the statue of a soldier for the Soldiers' Monument in Charleston; the equestrian statue of Emperor William I at Metz (1892); and, among many others in Bavaria, the army monument in the Feldheerenhalle at Munich and the equestrian statue of King Louis I at Regensburg (1902).

MILLER, FERDINAND VON (1813-87). A German bronze founder, born at Fürstenfeldbruck. He studied at the Munich Academy and learned his trade under his uncle, Stiglmayer, and in Paris with Soyer. His reputation was won by his castings from the designs of Schwanthaler, and especially by his monumental works, including the colossal statue of "Bavaria" in Munich and of the "Germania" of the Niederwald monument. His best-known work in America, where he executed over 80 commissions, is the bronze door of the Capitol in Washington. His sons, Ferdinand (q.v.) and Ludwig (1850-1912), also became bronze founders and sculptors.

MILLER, FRANK AUGUSTUS (1859-). An American art collector and antiquarian, born in Tomah, Wis. He removed in 1872 to California and in 1879 founded at Riverside the Glenwood Mission Inn. This he subsequently enlarged from time to time, using always and with rare artistic taste distinctive architectural

features of the mission buildings erected in that region during the eighteenth and early nineteenth centuries by Franciscan padres. The resulting edifice has been considered the most consistent and beautiful example of mission architecture in existence. Here Miller gathered from Spain, and elsewhere in Europe, as well as from California and Mexico, a large and interesting collection of bells and other objects of artistic worth and historic significance, reminiscent chiefly of the old Spanish missions in America.

MILLER, GEORGE ABRAM (1863-). An American mathematician, born at Lynnvill, Pa. He graduated from Muhlenberg College (Pa.) in 1887 and from Cumberland University (Ph.D.) in 1893 and studied later at Leipzig and Paris. He was principal of schools at Greeley, Kans. (1887-88); taught mathematics at Eureka (Ill.) College (1888-93), the University of Michigan (1893-95), Cornell (1897-1901), and Leland Stanford (1901-06). In 1906-07 he was associate professor and thereafter professor of mathematics at the University of Illinois. He taught also in the summer schools of the universities of Chicago (1912) and California (1913); became editor of the *American Mathematical Monthly* and of *School Science and Mathematics*; was coeditor of the *Encyclopédie des Sciences Mathématiques*; and is author of *Determinants* (1892) and coauthor of *Mathematical Monographs* (1911).

MILLER, HENRY (1800-74). An American physician, born at Lexington, Ky. After a short residence in Glasgow and Harrodsburg (both in his native State) he removed to Louisville upon the organization there of a new school of medicine. In this institution he held the chair of obstetrics and diseases of women and children until 1869. In 1859 he was president of the American Medical Association. Miller is author of *Treatise on Human Parturition* (1849) and *The Principles and Practice of Parturition* (1858).

MILLER, HENRY (1860-). An American actor and theatrical manager. He was born in London, but when 11 came to America with his parents and settled in Toronto, Canada, where he received a public-school education and made his first appearance on the stage in 1879. After a brief experience in Modjeska's company he came to New York in 1880 and appeared in minor Shakespearean rôles at the Booth Theatre with Adelaide Neilson. Six years later he joined Daniel Frohman's Lyceum Company and became leading juvenile. His best-known early rôles were Clément Hale in *Sweet Lavender* (1888), Colonel Kerchival West in *Shenandoah* (1889), and Claude Melnotte in *The Lady of Lyons* (1890). In 1893 he became a member of Charles Frohman's Empire Theatre Stock Company and remained there as leading man till 1896, playing among other parts John Worthing in *The Importance of Being Earnest* and Michael Faversham in *Michael and his Lost Angel*. After leaving the Empire company he made his first appearance as a star at the Garden Theatre, New York, in 1897. In 1903 he joined Margaret Anglin in a series of co-star performances, playing Dick Dudgeon in *The Devil's Disciple*, Armand Duval in *Camille*, and (in 1906) Stephen Ghent in William Vaughan Moody's *The Great Divide*. After touring America he made his first appearance in England in this last play in 1909. Thereafter he appeared in vari-

ous plays under his own management, including *The Rainbow* (1912) and *Daddy Long-Legs* (1915). Jointly with J. Hartley Manners (q.v.) he wrote *Zira*, and in it played the leading part (1906).

MILLER, HUGH (1802-56). A Scottish geologist and writer, born in Cromarty. He was brought up by two uncles, his father having been drowned when Hugh was five. From his seventeenth to his thirty-second year he worked as a stonemason and from 1834 to 1840 was a bank accountant. In 1829 he published a volume entitled *Poems Written in the Leisure Hours of a Journeyman Mason*. He also made researches in Scottish antiquities, contributed to John M. Wilson's *Tales of the Borders* (1834), and wrote *Scenes and Legends of the North of Scotland* (1835; 3d ed., 1853). However, his studies were mainly geological. His series of articles in this field, collected as *The Old Red Sandstone, or New Walks in an Old Field* (1841; 7th ed., 1907), first appeared in the *Edinburgh Witness*, a paper of which Miller had become editor a year earlier. These articles discussed the author's discovery of fossils in a formation where they had not been thought to exist. His editorial labors during the heat of the disruption struggle so seriously injured his health that for the larger part of 1845-46 he had to give up all literary activity. He resumed the editorship of the *Witness*, which, from 1845, when Robert Fairby and he became joint owners, ceased to represent the Free church. Miller killed himself while insane. His services to science were important, his observation being keen and exact. He was a pioneer in the popularizing of geology. His principal works, besides those already mentioned, are: *First Impressions of England and its People* (1846; 3d ed., 1853), containing many fine specimens of English descriptive prose; *Footprints of the Creator, or the Asterolepis of Stromness* (1847; 3d ed., 1850), designed as a reply to the *Vestiges of the Natural History of Creation*; *An Autobiography: My Schools and Schoolmasters, or the Story of my Education* (1852); *Testimony of the Rocks* (1857), an attempt to reconcile the geology of Genesis with that of nature. Consult Peter Bayne, *Life and Letters of Hugh Miller* (2 vols., Boston, 1871).

MILLER, JAMES (1776-1851). An American soldier and politician, born at Peterboro, N. H. He was educated for the bar, but in 1808 entered the United States army as major and took part in the frontier warfare, where he displayed great skill and courage. In 1812 he was brevetted colonel for gallantry in the engagement at Brownstown, where he commanded, and in 1814 took part in the Canadian invasion as colonel of the Twenty-first Infantry. In the battles of Chippewa and Lundy's Lane he did substantial service. A gold medal was presented to him by Congress and he was promoted to the rank of brigadier general. In 1819 he resigned from the army. From 1819 to 1825 he was Governor of Arkansas, then a Territory; and from that time until 1849 was collector of the port of Salem, Mass.

MILLER, JOAQUIN. See **MILLER, CINCINATUS HEINE**.

MILLER, JOHANN MARTIN (1750-1814). A German poet, member of the Göttinger Bund. He was born at Ulm, studied theology at Göttingen, and there made the acquaintance of Voss, the idyllist and translator of Homer, and

of Hölty, the lyricist. He contributed to the Göttingen *Almanach* poems which became very popular, especially "Was frag' ich viel nach Geld und Gut." But he is better known for *Siegwart, eine Klostergeschichte* (1776), a sentimental novel, the best of the imitations of Goethe's *Werther*, largely autobiographic and very didactic. His other fiction includes: *Beitrag zur Geschichte der Zärtlichkeit* (1776); *Briefwechsel dreier Freunde* (1776-77); *Geschichte Karls von Burgheim und Emiliens von Rosenau* (1778-79). A collected edition of Miller's poems appeared in 1783 and an autobiography in 1803. Consult Kraeger, *Johann Martin Miller* (Bremen, 1893), and Erich Schmidt, *Charakteristiken*, vol. i (2d ed., Berlin, 1902).

MILLER, JOHN FRANKLIN (1831-86). An American soldier and politician, born in South Bend, Ind. He took a course at the New York State Law School, graduating in 1852, and was elected a Republican member of the Indiana Senate in 1860, but resigned in order to enter the army on the outbreak of the Civil War. He was made colonel of the Twenty-ninth Indiana Volunteers and fought in many of the most important battles in the Mississippi region. For gallantry at the battle of Stone River he was made a brigadier general of volunteers. At Liberty Gap he was severely wounded, but he commanded a division at Nashville and was soon afterward brevetted major general of volunteers. Soon after the war he removed to San Francisco and was for four years collector of the port. He then entered business and was one of the originators and also president of the Alaska Commercial Fur Company. He took an active part in politics, was several times a presidential elector on the Republican ticket, in 1879 assisted in framing a new State constitution, and in 1881 was elected United States Senator from California and served until his death.

MILLER, JOSEPH, or JOSIAS, commonly known as **JOE MILLER** (1684-1738). An English comedian. With slight interruption he was connected with Drury Lane from 1714 to his death. Great favorites with the town were his Teague in Sir Robert Howard's *Committee* and Sir Joseph Wittol in Congreve's *Old Bachelor*. He was also popular in a score of other rôles. So ignorant that he was unable to read, he married that he might have some one to read his parts to him. Though he had no great reputation as a wit off the stage, yet the year after his death appeared a volume of jests ascribed to him under the title *Joe Miller's Jest*s. This pamphlet of 72 pages, containing 247 jests, was compiled by John Mottley for the publisher, T. Read. Why it was fathered upon a poor and illiterate actor is not clear; perhaps by mere accident. The jests are taken in part from earlier collections and in part from current witticisms that had not previously found their way into print. Only three are related of Miller himself. As a whole they are flat; their only piquancy is in their coarseness. But they were exceedingly popular, as is shown by the numerous editions that immediately followed (1st, 2d, 3d, 1739; 4th, 1740; 5th, 1742; 6th, 1743; 7th, 1744; 8th, 1745). The original number of jests, which had increased to 587 in the edition of 1745, continued to grow, until by the middle of the nineteenth century it had reached 1546. Consult the facsimile reprint of the first editions by Bellars (London, 1861) and Hazlitt, *Studies in Jocular Literature* (ib., 1890).

MILLER, JOSEPH NELSON (1836-1909). An American naval officer, born in Ohio. Entering the navy in 1851, he became commander in 1870, captain in 1881, commodore in 1894, and rear admiral in 1897. As executive officer on board the ironclad *Passaic* he was present at the attack upon Fort Sumter in 1863, and for bravery in this and the action against Fort Fisher was highly commended. He represented the Navy Department at the Queen's Jubilee in 1897, in 1898 raised the flag of the United States over Hawaii, and at the time of the Spanish-American War organized the Pacific naval reserves. In November, 1898, he was placed on the retired list.

MILLER, LEWIS (1829-99). An American philanthropist and inventor, born at Greentown, Ohio. He invented and manufactured a mower and reaper and other agricultural machines, which brought him a large fortune. He devised an auditorium for Sunday schools and introduced into Sunday-school services new instrumental music, such as that of piano and cornet. His experience and ideas in the development of religious organization in 1873 suggested to Bishop John H. Vincent the plan of the Chautauqua Assembly, which was adopted, and Miller became president of the Assembly after its foundation the next year. He gave largely to the support of the Assembly and to other enterprises.

MILLER, OREST FEDOROVITCH (1833-89). A Russian literary historian and critic, born in Reval. He studied at the University of St. Petersburg (1851-55) and was professor of early Russian literature there until 1888. His important lectures on *Russian Literature after Gogol* were published in 1874 and his *Slav World and Europe* in 1877. Though a prominent Slavophil, he was less radical than some writers, as is shown by his book on the Slav question (1865). He also wrote *Lomonosov* and *Peter the Great* in the following year, but became most widely known through his work on the national mythology, entitled *Ilia Muro-mets i Bogatyrsvo Kievskoe* (1870).

MILLER, PATRICK (1731-1815). A Scottish inventor, who is asserted by some first to have invented the steamboat. He was born in Glasgow, became a banker, and having accumulated a considerable property, interested himself in maritime inventions. In 1785 he bought the estate Dalswinton in Dumfriesshire and there conducted some experiments with a steamboat of his construction which was propelled by a Symington (q.v.) engine. In 1787 he published a description of one of his vessels under the title *The Elevation, Section, Plan, and Views of a Triple Vessel with Wheels, etc.* Miller was a close friend of Robert Burns. Consult Major General Miller, *A Letter to Bennet Woodcroft Vindicating the Right of Patrick Miller to be Called the First Inventor of Practical Steam Navigation* (London, 1862).

MILLER, RICHARD E. (1875-). An American figure painter. He was born in St. Louis and studied at the School of Fine Arts there (1885-89) and in Paris under Constant and Laurens (1899-1901). The first picture which he exhibited in the Paris Salon (1901) won a gold medal, and he continued to achieve distinction at the Salon. He made Paris his residence; became a Chevalier of the Legion of Honor (1908), a member of the International Society of Painters, Sculptors, and Gravers and

of the Society of American Painters, Paris, and was elected an associate of the National Academy of Design, New York. He is represented in the Luxembourg Gallery, Paris, by the "Old Maiden Ladies" and "Portrait of an Old Woman"; in the Metropolitan Museum of Art, New York, by "The Chinese Statuette"; the Gallery of Modern Art, Rome, "Lady with Fan"; Corcoran Gallery, Washington, "The Boudoir"; and also in the permanent collections of St. Louis, the Carnegie Art Institute, Pittsburgh, the Antwerp Museum, Musée du Petit Palais, Paris, Museum of Christiania, and the modern galleries of Florence and Venice. Among his more recent works are "Springtime," "Before the Mirror" (1913), "La Toilette" (1914), "The Open Window" (1914). Miller became one of the most prominent and influential among American painters residing abroad. His highly modern technique shows impressionistic influence, with delightful color schemes and very subtle and interesting treatment of light and shadow. He excels especially in figure compositions, depicted either out of doors or in rooms flooded with light. Quaint eighteenth-century costumes often add to the charm of his paintings.

MILLER, SAMUEL FREEMAN (1816-90). An American jurist. He was born in Richmond, Ky., graduated in medicine at Transylvania University in 1838, and afterward studied law and removed in 1850 to Iowa, where he became conspicuous in his profession. He ardently supported emancipation of the slaves and became a prominent member of the newly founded Republican party. In 1862 he was appointed an associate justice of the United States Supreme Court by President Lincoln. His decisions gave him a national reputation, and he was especially noted for his opposition to the encroachments of railroad corporations. In 1877 he was a member of the Electoral Commission and in 1887 was the orator of the Centennial Constitution celebration held at Philadelphia.

MILLER, WARNER (1838-1918). An American politician and manufacturer, born at Hannibal, Oswego Co., N. Y. He graduated at Union College in 1860. At the beginning of the Civil War he enlisted in the Fifth New York Cavalry and was promoted to be lieutenant. After leaving the army he became a paper manufacturer at Herkimer, N. Y., and in this business he accumulated a fortune. In 1872 he was elected a delegate to the National Republican Convention, and served as a Republican in the New York Legislature in 1874-75 and in the Forty-sixth and Forty-seventh Congresses (1879-81). He was elected to the United States Senate to fill the place of Thomas C. Platt, who resigned in 1881 as a result of the Conkling-Platt-Garfield fight concerning New York patronage, and served until 1887. As Senator, he was the author of bills granting increased pensions to disabled war veterans, of an eight-hour labor law for letter carriers, and of the "head money" immigration law. He incurred the bitter political enmity of Platt, as was evinced in the Republican National Convention when Harrison was nominated and when Miller was nominated, but defeated, for Governor of New York in 1888. After retiring, Miller gave his attention to his business, becoming an inventor of a wood-pulp process. He was also interested in an effort to construct an interoceanic canal by the Nicaragua route.

MILLER, WILLET GREEN (?1869-). A

Canadian geologist. He was born in the township of North Walsingham, Norfolk Co., Ontario, and was educated at Toronto, Chicago, Harvard, and Heidelberg universities. He was assistant in field geology, Canadian Geological Survey (1891-93); was lecturer and later professor of geology and petrography in Queen's University (1893-1902); and in 1902 was appointed provincial geologist and inspector of mines for Ontario. From 1897 to 1901 he was in charge of the field work in eastern Ontario for the Bureau of Mines. He was elected a member of the Canadian Mining Institute, the American Institute of Mining Engineers, and the Geological Society of America. In 1906 he was a delegate to the International Geological Congress, Mexico City; in 1908-10 he was president of the Canadian Mining Institute; in 1911 he became a fellow of the Royal Society of Canada; and in 1915, for distinguished work, he was awarded the gold medal of the Institution of Mining and Metallurgy, London, England. A large number of his contributions on geological and mining subjects appear in the annual reports of the Ontario Bureau of Mines. He published *Minerals and how they Occur* (1906).

MILLER, WILLIAM (1782-1849). An American religious leader, founder of the sect called Millerites or Second Adventists. He was born in Pittsfield, Mass., but when he was four years old his parents removed to Low Hampton, N. Y., which continued to be his home during most of the remainder of his life. He served as a captain in the American army during the War of 1812, but soon after its close became deeply interested in religion and devoted himself to the study of the Bible. As early as 1818 he came to the conclusion that Christ's second advent had been prophesied for the year 1843, and during the succeeding years became the author of a creed founded on this basis. In 1833 he was licensed to preach, though never ordained, by the Baptist church in Hampton and Whitehall, and in the same year issued a pamphlet entitled *Evidence from Scripture and History of the Second Coming of Christ about the Year 1843; and of His Personal Reign of One Thousand Years* (1833). Soon afterward he began to lecture on the same subject to large audiences in the New England and Middle States. As the year 1843 drew near his followers awaited the second coming with intense excitement. When the year ended he wrote to them confessing his error and acknowledging his disappointment. Later he set Oct. 22, 1844. Even after this second failure many of his disciples remained faithful to him and continued so till the day of his death. The name Adventist was agreed upon in 1845 as the proper designation of his creed. Consult Sylvester Bliss, *Memoirs of William Miller* (Boston, 1853), and James White, *Sketches of the Christian Life and Public Labors of William Miller* (Battle Creek, 1875).

MILLER, WILLIAM (1795-1861). An English soldier, born at Wingham, Kent. Entering the British artillery, he served under Wellington in the Peninsular campaigns of 1811-14 and took part in the operations in Chesapeake Bay (1814). Returning to England, he traveled in Europe for two years and then went to Argentina. Later he joined the Patriot army in Chile and distinguished himself in many battles in the struggle for the independence of that country. In 1821 he went to Peru, where he rendered valuable service to the Patriot cause and rose to the

rank of general of division. He became intimate with Bolívar, was made Governor of Potosí in 1825, and the following year returned to Europe, where he was received with many marks of distinction. In 1843 he was appointed British Consul General in the Pacific, in which post he served till his death. Consult John Miller, *Memoirs of General Miller in the Service of the Republic of Peru* (2d ed., 2 vols., London, 1829).

MILLER, WILLIAM (1834-1912). A Canadian statesman, born at Antigonish, Nova Scotia, and educated at the academy there. Called to the bar in 1860, he became queen's counsel in 1872 and took rank as one of the leaders in his profession. He was elected a Liberal-Conservative member of the Nova Scotia Assembly in 1860 and was prominent in the debates on the Confederation of Canada. Although opposed to the financial part of the scheme, he rendered important service by carrying a resolution authorizing Nova Scotia delegates to frame a Confederation plan in London, England. Thus were secured, under Imperial auspices, changes which made the federal union acceptable to the Nova Scotia Legislature at a time when all appearances were adverse. Miller was called to the Senate in 1867, was Speaker thereof in 1883-87, and remained a member of that body until his death. He was chairman of the standing committees on private bills, railways and canals, and banking and commerce, and also of the joint committee of both Houses of Parliament on the codification of the criminal law. In 1891 he was sworn a member of the Queen's Privy Council for Canada.

MILLER, WILLIAM HALLOWES (1801-80). An English mineralogist. He was born at Vellindre, near Llandoverly, and was educated at St. John's College, Cambridge, where, after graduating in 1826, he became fellow and tutor. In 1832 he was appointed professor of mineralogy and in 1838 was elected a fellow of the Royal Society. In 1838 appeared his famous system of crystal notation in *A Treatise on Crystallography*, the most consistent and adaptable devised up to that time and still in common use. From 1843 to 1854 he was engaged as member of a government commission in replacing the standard of weights and measures, which had been destroyed by fire. In 1870 he served on the Commission Internationale du Mètre and from 1856 to 1873 was foreign secretary of the Royal Society. He contributed frequently to the scientific press and published *The Elements of Hydrostatics and Hydrodynamics* (3d ed., 1843).

MILLER, WILLIAM HENRY HARRISON (1840-1917). An American lawyer and cabinet officer. He was born in Augusta, Oneida Co., N. Y., and graduated at Hamilton College in 1861. He removed in the same year to Ohio, taught school at Maumee for six months, and then enlisted as a private in the Eighty-fourth Ohio Volunteers and was promoted to a lieutenantancy. When his term of enlistment was completed he read law for some time at Toledo in the office of Judge Waite, and in 1863 settled in Peru, Ind., as superintendent of schools. There he was admitted to the bar in 1865. In 1866 he removed to Fort Wayne, where he practiced his profession until 1874, when, having established his reputation, he went to Indianapolis to become the law partner of Benjamin Harrison (q.v.). Their association lasted until the death of the latter, continuing throughout Harrison's administration as President, during which period (1889-93) Miller served as Attorney-General of

the United States, retiring to private practice in 1893. Perhaps his most prominent act while in the cabinet was in connection with the famous Terry case, in which he claimed that it was the constitutional duty of the executive to protect the judiciary.

MILLER, WILLIAM LASH (?1866–). A Canadian chemist. He was born at Toronto and was educated at Toronto and Munich universities. For several years he was a demonstrator of chemistry in Toronto University and in 1907 was appointed professor of physical chemistry. He was elected a member of the American Association for the Advancement of Science, vice chairman of the Canadian section, Society of Chemical Industry (1909), and a fellow of the Royal Society of Canada. He published many scientific papers.

MILLERAND, mēl'rān', ALEXANDRE (1859–). A French statesman and for long a Socialist leader, born in Paris, where he was educated at the Lycée Vanves and the Lycée Henri IV and, in law, at the university. He began to practice in Paris in 1881, was counsel to the striking miners of Montceau-les-Mines in 1882; was elected to the municipal council in 1884; and as a Radical Socialist, to the Chamber of Deputies in 1885. In 1889 he became proprietor of *La Voix*, which he made the organ of his personal views. In the Chamber of Deputies Millerand urged many reforms, especially relating to social legislation. He also gained prominence as editor in chief of the *Petite République* (until 1896) and as an impassioned orator. In 1899, as leader of the Parliamentary or Opportunist Socialists, he was made Minister of Commerce in the Waldeck-Rousseau cabinet against the wishes of the Marxian Socialists led by Guesde (q.v.). In this office he did much to pass laws in favor of the working classes. Some of the most important of these were the establishment of one day's rest a week, and a law making 10 hours the maximum day for women and children; he also made many attempts to procure the adoption of compulsory arbitration in industrial disputes. In 1902, just before the cabinet went out of office, a bill was passed making eight hours the maximum day for French miners. Millerand was expelled from the Socialist party because he had taken office in a non-Socialist cabinet. In 1909 he was Minister of Commerce and Postal and Telegraph Service. In the first Briand ministry (1909–10) he held the portfolio of Public Works and in 1912 entered Poincaré's cabinet as War Minister. He won great distinction in this office because of his energy in reorganizing the army and infusing it with enthusiasm. On Aug. 26, 1914, Millerand was again entrusted with the War portfolio under Viviani. On Sept. 23, 1920, he was elected President of France. See SUPPLEMENT.

MILLERITE (named in honor of W. H. Miller). A native nickel sulphide that crystallizes in the hexagonal system, has a metallic lustre, and is of a yellowish color. It occurs usually in capillary crystals in cavities with crystals of other minerals, especially in Bohemia, in Saxony, and in Cornwall, England; in the United States it is found at Antwerp, N. Y., in Lancaster Co., Pa., and especially in geodes in limestone near St. Louis, Mo., and Milwaukee, Wis. Millerite has been made artificially in groups of needle-like crystals.

MILLERSBURG. A village and the county

seat of Holmes Co., Ohio, on Killbuck River, 86 miles south of Cleveland, on the Cleveland, Akron, and Columbus and the Baltimore and Ohio railroads (Map: Ohio, G 4). It has manufactures of foundry and machine-shop products, glassware, flour, brick, lumber, etc. Millersburg is surrounded by a rich agricultural region, carries on a considerable trade in draft horses, and has in its vicinity deposits of coal, iron ore, clay, and shale. The village owns and operates its water works. Pop., 1900, 1998; 1910, 2020.

MILLER'S TALE, THE. One of Chaucer's *Canterbury Tales*. It is the familiar story of an old husband deceived by a young wife. In this case the husband is a rich old simpleton, a carpenter of Oxford. The source is unknown, but is supposed to be one of the rude jesting stories of the time.

MILLER'S-THUMB (so called from the shape of the head), or RIVER BULLHEAD. A small, spiny-rayed fish (*Cottus gobio*) common in the streams of England and northern Europe and Asia. It rarely reaches 5 inches in length. It is brown above, varying in intensity, as in many fishes, with the color of the bottom, and white beneath. Its disproportionately large, flattened head compared to its body, and the entire absence of scales, give it an ugly appearance. The flesh is reddish when boiled, is said to be of excellent flavor, and is much sought after in some countries. In the United States a related species (*Cottus ichtalops*) is sometimes called miller's-thumb. It occurs in all clear streams of the Northern and Middle States. These fishes live on small organisms and on fish eggs and are considered a destructive pest by fish culturists, especially in respect to trout eggs. The English fish is a favorite among anglers. Consult T. N. Gill, *Miller's Thumb and its Habits*, *Smithsonian Institution, Miscellaneous Collections* (Washington, 1910).

MILLES, mil'ēs, VILHELM KARL EMIL ANDERSSON (1875–). A Swedish sculptor, born near Upsala and educated in Stockholm and Paris. His father's name was Andersson, Milles being the name of a related family. His works include the Sten Sture monument (near Upsala), the polychrome statue of Gustavus Vasa, seated (Nordiska Museum, Stockholm), portrait busts of J. Kronberg (bronze, Göteborg Museum), O. Lev-ertin (wood, National Museum), Mittag-Leffler (bronze), F. Boberg (bronze, National Museum), and G. Stridsberg (granite, National Museum); studies in animal life, as "Playing Elephants" (National Museum) and "Playing Bears" (granite, entrance to Berzelii Park, Stockholm). Later works are "Vingarna," boy with eagle (1910, bronze, National Museum), and the Scheele statue (1912, Köping). Milles is to be placed in the front rank of Swedish sculptors of his time.—His sister RUTH ANNA MARIA MILLES (1873–), also a sculptor, was born at Valentuna and studied in Stockholm and (1898–1904) in Paris. She is best known for her statuettes, groups, and reliefs of types from Brittany and later Sweden, as: "Redcap and Wolf," "Fisherman's Wife," "Wild Flower," "Young Mother," "Bouquet-Lisa" (Thiels Gallery), "On the Way from Church," "Yvonne," "After Waiting" (National Museum), and "Wood from the Woods."

MIL/LET (Fr. *millet*, dim. of *mil*, OF. *mil*, *meil*, It. *miglio*, from Lat. *milium*, millet). A name applied to certain cereal and forage grasses of several distinct genera and species. Millets

are extensively used as forage crops in many countries and it has been estimated that they furnish food for about one-third of the inhabitants of the globe. They are widely cultivated for food in India, Japan, and other parts of Asia. In the United States the cultivated varieties of millet may be divided into three groups, viz., foxtail millets, barnyard millets, and broom-corn millets. The foxtail millets, perhaps the most important group, are of very ancient cultivation. They are believed by some writers to have been included in the order of Chinnong, 2700 B.C., requiring certain plants to be sown each year by the Emperor of China in a public ceremony. De Candolle considers this kind of millet a native of China, Japan, and the Indian Archipelago. The most common varieties of this group all belong to one species, *Setaria italica*, and are grown in North America, Europe, India, China, Japan, and north Africa. The barnyard millets include the cultivated varieties of the widely distributed species *Panicum Crusgalli*, or barnyard grass, and also the varieties belonging to other species of the genus *Panicum*, especially *Panicum colonum* and *Panicum frumentaceum*. The varieties derived from *Panicum Crusgalli* are considered the true barnyard millets, and among them a variety of Japanese barnyard millet and the Ankee grass of the southwestern United States are the most important. Shama or Sanwa millet, or jungle rice (*Panicum colonum*), a tropical plant, closely allied to true barnyard grass, is a valuable food and forage plant in many tropical and subtropical regions and extensively grown in southern and eastern Asia, but little in the United States. The third group, or broom-corn millets, comprises the varieties of *Panicum miliaceum*. This species, universally known to agriculture, has been in cultivation in Europe since prehistoric times and is still the common millet of the Old World. Its origin is very uncertain, but it is probably a native of the warmer regions of Asia. The classification of varieties of this species is based mainly upon the color of the ripe seed—yellow, white, and red. The term Indian or African millet is often loosely applied to certain of the nonsaccharine sorghums, such as durra, Kafir corn, and pearl millet (*Pennisetum typhoides*), which last is also called Egyptian or cat-tail millet. Efforts have been made to develop the production of the class known as Kafir corn in certain sections of the United States having an insufficient rainfall to insure a reliable maize crop. The quantities produced have been satisfactory but the domestic market has thus far been extremely limited, considerable quantities having been exported to Europe where it is used as food for animals and domestic fowls. See ANDROPOGON; SORGHUM.

Millets are not well adapted to heavy clay or wet soils, but succeed best on fertile friable loams. The preparation of the soil is the same as for other grass crops. In the United States the seed is usually sown late in the spring to prevent the harvest of the millet from interfering with the harvest of the cereals. The seed is usually sown broadcast at the rate of one-half bushel to the acre. It is, however, often drilled. For hay, millet is usually harvested with a mower when the crop has just finished heading, and for the seed with a reaper like cereals a little before it is fully ripe. If harvested when fully ripe there is usually a heavy loss of seed in handling. Where the self-binder is used in har-

vesting this crop the sheaves are bound loosely and put up in shocks to cure. The yield of cured hay per acre ranges from four to six tons and the yield of seed from 40 to 50 bushels. According to the thirteenth census the United States produced, in 1909, 1,743,887 tons of millet hay and 588,270 bushels of seed, a decrease in the crop of about 25 per cent compared with 1899. This crop is practically free from attacks of insects and plant diseases.

Feeding Value. Millet is valuable principally as hay and as a soiling crop. It is also useful for silage. The ripened seeds are seldom fed to stock, but are much used as food for poultry and birds. If used as stock food they should be crushed or ground. The seed of broom-corn millet has found more favor in the United States as a cattle feed than that of other varieties. German millet cut when the heads are well filled but the seeds still soft has the following percentage composition: water, 71.7; protein, 2.7; fat, 0.5; nitrogen-free extract, 14.3; crude fibre, 9.3; and ash, 1.5. German millet hay: water, 7.7; protein, 7.5; fat, 2.1; nitrogen-free extract, 49; crude fibre, 27.7; and ash, 6. Other millets fresh and cured resemble in composition the examples quoted more or less closely. The average percentage composition of millet seed follows: water, 14; protein, 11.8; fat, 4; nitrogen-free extract, 57.4; crude fibre, 9.5; and ash, 3.3. In the case of barnyard millet hay 57.4 per hundredweight, of the protein 63.7 per hundredweight, of the nitrogen-free extract 51.6 per hundredweight, and of the crude fibre 61.6 per hundredweight were on the average found to be digestible. Millet hay is a useful coarse fodder for cows, but not more than six or eight pounds should be fed daily. When fed to lambs care should be exercised, as millet hay causes scours unless fed in small quantities. It has been observed that when horses were fed millet hay exclusively as coarse fodder, painful conditions called millet disease were induced. It is believed that the trouble may be avoided by using this hay in limited quantities, and not continuously. It is also possible that millet grown in some regions is harmless, while that grown in others is harmful. The plant has been used for farm animals since very early times, and generally speaking has proved a satisfactory feeding stuff. See Colored Plate of CEREALS.

MILLET, mè'là', AIMÉ (1819-91). A French sculptor and painter. He was born in Paris, received his first instruction in painting from his father, and studied sculpture with David d'Angers, and after 1852 gave up painting entirely. For his work in sculpture he won a gold medal at the exposition of 1889. His most ambitious work was the erection for Napoleon III in 1865 of a colossal copper statue of Vercingetorix at Alise-Sainte-Reine. His statues adorn several public buildings in Paris, among them an "Apollo" in bronze at the New Opéra. His mythological statues and groups include "Bacchante" (1885); "Narcissus" and "Ariadne," acquired by the state. Among his portrait statues are those of Denis Papin at Blois, Chateaubriand at St. Malo, Gay-Lussac at Limoges, and Edgar Guinet at Bourg. He executed many portrait busts and statues in marble and bronze. Although realistic in character, his art is theatri-

cal in pose. Consult Dumesnil, *Aimé Millet* (Paris, 1891).

MILLET, FRANCIS DAVIS (1846-1912). An American mural and genre painter, war correspondent, illustrator, and author. He was born at Mattapoisett, Mass., Nov. 3, 1846, took part in the Civil War as a drummer and assistant surgeon, and graduated at Harvard (A.B., 1869; A.M., 1872). He was a pupil at the Royal Academy of Fine Arts at Antwerp (1871-72), and also studied in France and Italy, at the same time writing illustrated articles for American periodicals. During the Russo-Turkish War (1877-78) he was engaged by the *New York Herald*, the *London Daily News*, and the *London Graphic* as war correspondent, attached to General Skobelev's staff. His stories from the front were accompanied by sketches. He was director of the decorations and functions of the World's Fair at Chicago in 1893. The year 1898 saw him in the Philippines as the correspondent of the *London Times* and *Harper's Weekly*. Millet is now best known for the mural paintings to which he devoted the latter years of his life. The greatest of these is probably the "Evolution of Navigation" in the Custom House at Baltimore, Md.; but there are other important examples of his work in this field in the Post Office, Cleveland, Ohio; the Governor's room of the Minnesota State Capitol; the Hudson County Court House, Jersey City; the Essex County Court House, Newark, N. J.; the Supreme Court at Madison, Wis. The same strong synthetic sense, accuracy of detail, and harmonious grouping displayed in his decorative works also distinguishes his highly finished genre paintings of England in the eighteenth century and of classic Rome and Greece, in which costume and interior are studied with much detail, showing the influence of the Dutch school. His chief easel paintings include: "At the Inn," Union League Club, New York City; "A Cozy Corner" and "An Old-Time Melody," both in the Metropolitan Museum; "Between Two Fires," Tate Gallery, London; portraits of Mrs. Millet and President Butler of Columbia University (1906). He was prominently identified (1905-06) with the organization and endowment of the American Academy at Rome (q.v.), of which he was the first secretary. He was elected a member of the National Academy of Design (1885) and of the American Academy of Arts and Letters and an honorary member of the American Institute of Architects; was decorated with Russian and Rumanian military orders and medals for bravery; and received medals for paintings shown at Paris (1889), Chicago (1893), and Buffalo (1901). His literary works include: *Capillary Crime and Other Stories* (1892); *The Danube* (1892); *The Expedition to the Philippines* (1899). Millet lost his life in the sinking of the *Titanic*, April 15, 1912. For many years he had lived in Worcestershire, England. In 1913 a fountain was erected in Washington, D. C., in memory of Millet and of Archibald W. Butt (q.v.). Consult Beckwith, Baxter, Maynard, Blashfield, and Coffin, *Art and Progress*, vol. iii (Washington, 1912).

MILLET, mé'lá', JEAN FRANÇOIS (1814-75). A French genre and landscape painter of the Barbizon group, the greatest of all peasant painters. He was born at Gruchy, near Gréville (Manche), Oct. 4, 1814, the eldest son of a Norman peasant. His father, who exercised a great influence upon Millet's life and character,

was a man of refined and deeply religious nature and of musical tastes, being cantor in the village church. Under the tuition of the village priest he received an elementary education, even mastering Greek, but his early years he spent on the farm, trying, during hours of rest, to draw the familiar scenery and life about him. His father took him to the neighboring town of Cherbourg, where he studied under Mouchel, a pupil of the school of David, and Langlois. In 1837, aided by a small gift of money from the council general of the department and by a small pension granted by the town council of Cherbourg, Millet went to Paris. He entered the studio of Delaroche, but, unable to endure his master's conventional methods, and constrained by poverty, he soon withdrew. With Marolle, a friend, he opened a little studio, giving his evenings to study and his days to painting cheap portraits and pastel imitations of Boucher and Watteau. He won some recognition with a portrait in the Salon of 1840, but soon returned to Normandy, where he married (1841). There he supported himself by painting signboards, and also produced "Sailors Mending a Sail" and other genre works. In 1842 he returned to Paris and in 1844 attracted the favorable attention of artists by his "Milkwoman" and "Riding Lesson." On the death of his wife he returned to Normandy, but remarried and came again to Paris in 1845. After a series of religious and classical subjects, none of which attained success, he at last found himself in the "Winnower" (1848, Louvre), his first important picture, bought by Ledru-Rollin, the Minister of State during the revolution of 1848, in which Millet took part.

In 1849 he abandoned Paris for the village of Barbizon, which he made his permanent home. Here the Norman peasant, as he called himself, was surrounded by scenes he loved, with incomparable models for the peasant pictures to which he henceforth devoted himself. "The Sower" (1850, Vanderbilt collection, Metropolitan Museum, New York) was followed by "Man Spreading Manure" (1852); "The Reapers" (1853); "A Peasant Grafting a Tree" (1855); "The Gleaners" (1857, Louvre), one of his very best works; "The Angelus" (1857, Louvre); "Death and the Woodcutter" (1859, Copenhagen Gallery); "Woman Feeding her Children" (La Bequée, 1860), in the Lille Museum; and others, all produced while he was hampered by illness and debts. In 1860 he bound himself by contract to give all his work for three years for 1000 francs a month, but the contract was dissolved in six months. To this period belong "The Sheep Shearing" (1860); "Woman Feeding Child," "The Sheep Shearer," "Waiting" (all in 1861); "Potato Planters" (1862); "The Wool Carder" (1863); and "The Man with the Hoe" (1863, San Francisco Museum). From 1860 his reputation was regarded as established, and after 1863 he no longer suffered want. In 1864 he exhibited "The Shepherdess" (Louvre) and "Peasants Bringing Home a Calf"; in 1865 he produced some decorative work. At the Paris Exposition of 1867 he received a medal of the first class and in 1868 the ribbon of the Legion of Honor. Driven from Barbizon by the Franco-Prussian War, Millet repaired to Cherbourg and did not return until late in 1871. He was deeply affected by the death, in 1867, of his friend Rousseau, with whom, of all others, he was most intimate. Although the state of his health,

which had been failing for some time, curtailed the hours of work, he continued to paint until December, 1874, when fever set in and he died on Jan. 20, 1875.

He was one of the artists selected by the government to decorate the Panthéon, but did not live to complete the commission. A number of important works are owned in the United States, among which are: "The Sower" and the "Water Carrier," "The Shepherdess," "At the Well," "The Knitting Lesson," "Hunting in Winter," the water color "Shepherd and Dog," and "Girl Raking Hay," all in the Metropolitan Museum, New York; "The Grafter," "Shepherdess," and "Water Carrier" (all three belonging to William Rockefeller); "The Turkey Keeper" (C. A. Dana, New York); "A Shepherdess Seated," "Homestead at Gréville," "Harvesters Resting," "Portrait of himself" and others in the Boston Art Museum; the "Planters" (Quincy Shaw collection, Boston); "Potato Harvest," "Sheepfold," "Breaking the Flax," and five other works in the Walters collection, Baltimore. Although Millet's paintings began to increase in value before his death, his family was left in straitened circumstances and was pensioned by the government. His principal pictures have been etched and engraved. Himself a peasant, living the peasant's life, he painted his class as has never been done before or since. Omitting the accidental, he rendered only the typical, and his great shadowy figures seem inevitably a part of the earth. It was the master's custom to paint from memory, using his admirable sketches but no models, and to this is partially due the simplicity and breadth with which he treated his subjects.

Equally famous with Millet's paintings are many of his drawings, such as his own portrait (1848); "Woman Feeding Chickens"; "Shepherd with Flock"; "The Newborn Lamb"; "Laundresses on the Shore"; "First Steps." His pastels, too, are much prized; good examples are the "Vine Dresser Resting" and "Woman Churning." All show a good draftsman, with a fine feeling for form. His color is sad in tone, gray and brown usually prevailing; and he achieved harmony by a masterly treatment of light and atmosphere. The landscape background and the animals of his paintings are the equals of those done by the greatest specialists in these branches. Among the best of his pure landscapes are "Church of Gréville," "Spring," and "Winter"; the first two are in the Louvre, which, since the acquisition of the famous Chauchard collection, contains in all 21 paintings by Millet. He was also an etcher of great power, as is evident from his 13 original plates of subjects of peasant life, as well as from a number of others after his paintings. His designs for woodcuts, generally engraved by his two brothers, show great originality, being executed in bold, coarse outlines, more like those of the old German masters than nineteenth-century etchings. Monuments to Millet have been erected in Cherbourg and Gruchy, and a bronze plaque attached to a rock at the entrance to the forest of Fontainebleau is dedicated to him and Rousseau.

Bibliography. Much the best biography of Millet was written by his friend Alfred Sensier, *La vie et l'œuvre de Jean François Millet* (Paris, 1881; abridged Eng. trans., Boston, 1896). Consult also: Alexandre Piedagnel, *Jean François Millet: souvenirs de Barbizon* (Paris, 1876);

MILLET, PIERRE (1635-1708). A Canadian pioneer missionary. He was born in Bourges, France, was educated for the Roman Catholic priesthood, and came to Canada in 1667. The following year he went to New York as a missionary to the Onondaga Indians. In 1672 he undertook a mission to the Oneidas in that colony, where he labored devotedly. He returned to Canada, met Governor Denonville at Cataragui in 1686 and, in consequence of the Governor's expedition against the Iroquois, was suspected, though unjustly, of instigating it. At first the Oneidas, one of the Iroquois tribes, were hostile and sent a war party which captured him at Cataragui in 1689 and took him back a prisoner to their country. They tortured him and threatened to kill him, but he was finally set free and adopted into their tribe, where he remained until 1694. In that year he returned to Quebec, where he died.

MILLET BEER. See BEER.

MILLI, mĕl'ĕ, GIANNINA (1825-88). An Italian poetess. She was born at Terama and when but a child of five years is said to have composed verses. When 17 or 18 years of age she became a pupil of the poet Regaldi, the greatest of Italian improvisators, and soon developed considerable power in improvising popular religious and amatory verses. Medals were awarded her, and after her trips through the principal Italian cities (1857-60) a pension was bestowed upon her. She was appointed inspector of elementary schools for girls and superintendent of the normal school for young women in Rome. Her poems appeared in two volumes in 1862-63.

MILLIGAN, EX PARTE. The title of an important decision rendered by the Supreme Court of the United States in 1866, growing out of the events of the Civil War. The precise question raised was whether a citizen domiciled in a State where peace prevails, but which is adjacent to the theatre of war, may be deprived of the right of trial by jury and be subjected to trial before a military commission composed of army officers. The case grew out of the arrest of one Milligan, a citizen of Indiana, by a United States military officer in 1864 on charges of conspiracy, disloyal practices, inciting insurrection, and giving aid and comfort to the enemy. He was tried before a military commis-

MILLET

"THE GLEANERS," FROM THE PAINTING IN THE LOUVRE, PARIS

sion at Indianapolis, was found guilty, and was sentenced to be hanged. His counsel thereupon filed in the Circuit Court of the United States a petition for a writ of habeas corpus, denying the jurisdiction of the military commission on the ground that the civil courts in Indiana were open and unobstructed in the performance of their duties, that a United States grand jury which was then in session failed to find a bill of indictment, that the plaintiff was a civilian in no way connected with the military service, and that he was not a resident of a rebel State. The case was finally carried to the Supreme Court of the United States, where it was held that a military commission organized during the war in a State not invaded or in rebellion, and where the Federal courts were open and unobstructed, had no jurisdiction to try, convict, or sentence for a criminal offense a citizen who was neither a resident of a State in rebellion nor a prisoner of war nor a person in the military or naval service, and that Congress had no power to confer such authority on it. This opinion was rendered by a bare majority of the court, a vigorous dissenting opinion being delivered by Chief Justice Chase, in which three other justices concurred. The decision is given in *Wallace's Reports*, vol. iv. See MILITARY LAW; MARTIAL LAW.

MILLIGAN, GEORGE (c.1861–). A Scottish biblical scholar, son of William Milligan. He was educated at Aberdeen, Edinburgh, Göttingen, and Bonn; was minister of St. Matthew's, Morningside, and of Caputh; and in 1910 became regius professor of divinity and biblical criticism in Glasgow University. He published: *History of the English Bible* (1895); *The Lord's Prayer* (1895); *The Theology of the Epistle to the Hebrews* (1899); *The Twelve Apostles* (1904); *St. Paul's Epistles to the Thessalonians* (1908), Greek text, introduction, and notes, with special study of syntax and style; *Selections from the Greek Papyri* (1910); *The New Testament Documents: Their Origin and Early History* (1912), the Croall lectures for 1911–12; *The Vocabulary of the Greek Testament* (1914 et seq.), with J. H. Moulton.

MILLIGAN, ROBERT WILEY (1843–1909). An American naval officer. He was born in Philadelphia, entered the United States navy as third assistant engineer in 1863, and was regularly promoted to chief engineer in 1892, commander in 1899, and captain in 1902. During the Civil War he participated in both battles of Fort Fisher, and in the capture of Petersburg and Richmond, and during the Spanish-American War he was chief engineer of the *Oregon* on her famous run from the Pacific to the Atlantic coast and in the battle of Santiago. He served as chief engineer of the Norfolk Navy Yard from 1899 to 1905, when he was advanced to the rank of rear admiral and retired.

MILLIGAN, WILLIAM (1821–93). A minister of the Established church of Scotland, born in Edinburgh. In 1839 he graduated from St. Andrews University. He stood by the "Auld Kirk" at the disruption (1843), and was ordained minister to the Parish of Cameron, Fife, the following year. He studied in Germany from 1845 to 1846 and was placed at Kilconquhar from 1850 until 1860, when he was asked to occupy the newly created chair of biblical criticism in Aberdeen University. He assisted in the revision of the New Testament in 1870 and published works on the *Higher Education of*

Women (1878); *The Resurrection of Our Lord* (1881; new ed., 1905); *Commentary on the Revelation* (1883); *Baird Lectures on the Revelation of St. John* (1886); *Elijah* (1887); *The Resurrection of the Dead* (1890); *Aims of the Scottish Church Society* (1892); besides a notable article for the *Encyclopædia Britannica* on the Epistle to the Ephesians (1879). He was sent to the United States Presbyterian General Assembly (1872) as a delegate from the corresponding body in Scotland.

MILLIKIN UNIVERSITY. See JAMES MILLIKIN UNIVERSITY.

MILLIN, mé'lân', AUBIN LOUIS (1759–1818). A French archaeologist, born in Paris. His first literary attempts were translations from the German and English, which were published in the *Mélanges de littérature étrangère* (1785–86). His protest against the excesses of the Revolution made it necessary for him to flee from Paris, and he was imprisoned for a year in St. Lazare on his return. In 1795 he was placed in charge of the cabinet of antiques and medals in the National Library, was instrumental in the creation of a chair of antiquities, and the same year undertook the direction of the *Magazin Encyclopédique*. Much of his voluminous writing on his special subject appeared in this periodical, which, in 1817, became the *Annales Encyclopédiques*, and he published also *Antiquités nationales* (1790–98); *Introduction à l'étude des médailles* (1796); *Monuments antiques inédits* (1802–04); *Dictionnaire des beaux-arts* (1806); *Histoire métallique de la révolution française* (1806). His travels in Italy and the south of France in search of antiques provided material for *Voyage dans les départements du midi de la France* (1807–11); *Peintures de vases antiques* (1808–10; new ed., 1891); *Voyage en Savoie, au Piémont, dans le Milanais* (1816–17).

MILLING MACHINE. See METAL-WORKING MACHINERY.

MILLINOCK'ET. A village in Penobscot Co., Me., 83 miles by rail north of Bangor, on the Bangor and Aroostook Railroad (Map: Maine, D 3). The manufacture of paper constitutes the chief industry. Some timber is found in the surrounding region. Pop., 1910, 3368.

MILLIPEDE. A myriapod of the order Chilognatha (or Diplopoda) having a dorsally convex body composed of many segments, all of which, except the first four, bear each two pairs of legs, and lacking maxillipes. See CENTIPEDE; MYRIAPODA.

MILLIS, JOHN (1858–). An American officer of engineers, born at Wheatland, Mich. He graduated, with first rank, from the United States Military Academy in 1881, and served at Willets Point, N. Y. (1881–83), and on lighthouse duty, especially in experiments with electric lighting (1883–90). Millis was charged with the preparation of the lighting of the Bartholdi Statue in New York harbor. From 1890 to 1894 he managed Federal improvements in the Mississippi levees and New Orleans harbor; then for four years was chief engineer of the Lighthouse Board; and in 1900 was delegate to electrical, physical, and navigation congresses in Paris during the Exposition, and was sent to Egypt to report on the Assuan Dam. After his return to America he was ordered to Seattle to construct fortifications in Puget Sound and government improvements in Washington, Idaho, and Montana. In 1905–07 he had charge of all

fortification construction in the Philippine Islands, conducted the river and harbor improvements in Indiana and Ohio and on Lake Erie in 1908-12, and was then detailed for special duty under the Bureau of Lighthouses. He was promoted to colonel of engineers in 1910.

MILLÖCKER, mil'le-kër, KARL (1842-99). An Austrian composer of light opera. He was born in Vienna and received his musical education in the conservatory of that city. In 1864 he was appointed kapellmeister at the Graz Theatre and from 1869 to 1883 occupied a similar position at the Theater an der Wien in Vienna. His music is marked by its spontaneous melodiousness and sprightly instrumentation. The principal published works include: *Der todte Gast* and *Die beiden Binder* (1865); *Diana* (1867); *Die Fraueninsel* (1878); *Der Regimentstambour* (1869); *Drei Paar Schuhe* (1870); *Die Musik des Teufels* (1870); *Das verunschene Schloss* (1878); *Apajune, der Wassermann* (1880); *Die Jungfrau von Belleville* (1881); *Der Bettelstudent* (1881); *Gasparone* (1884); *Der Viceadmiral* (1886); *Die sieben Schwaben* (1887); *Der arme Jonathan* (1890); *Das Sonntagskind* (1892); *Der Probekuss* (1895); *Das Nordlicht* (1897).

MILLOM. A town in Cumberland, England, 9 miles northwest of Barrow. It is situated on the west coast of Duddon estuary and has a shallow tidal harbor. It numbers among its antiquities an early Norman church and the eleventh-century Millom Castle. The most productive mines of red hematite ore in England are worked in the vicinity, and it has numerous blast furnaces. The town owns its markets, water and gas works, and maintains a library, technical schools, recreation grounds, and isolation hospital. Pop., 1901, 10,426; 1911, 8612.

MILLO MAIZE. See ANDROPOGON; SORGHUM.

MILL ON THE FLOSS, THE. A novel by George Eliot (q.v.), published in 1860.

MILLS, ALBERT LEOPOLD (1854-1916). An American soldier, born in New York City. He graduated at the United States Military Academy in 1879, was appointed second lieutenant of the First Cavalry, was stationed at Fort Walla Walla, Washington Territory (1879-82), and engaged in frontier duty elsewhere. He saw active service against the Crows in 1887 and against the Sioux in 1890. He became first lieutenant in 1889. He was professor of military science and tactics at the State Academy, Charleston, S. C., for a year (1886-87), held an appointment at the United States Infantry and Cavalry School, Fort Leavenworth, Kans., from 1894 until 1898, and in the Spanish-American War participated in the Santiago campaign as captain and assistant adjutant general of volunteers. He was voted a medal by Congress in 1898, for his services near Santiago. In August, 1898, he was made superintendent of the United States Military Academy, West Point, with the rank and pay of colonel, and in October of the same year was promoted to the regimental rank of captain. In 1904 he was made brigadier general and in 1906 was detached from the command of the Military Academy, the scope and general efficiency of which had broadened considerably under his administration, and was assigned to duty in the Philippine Islands. In 1909 he returned to the United States to take command of the Department of the Gulf, and in 1912 was for part of a year president of the Army War College. After

September of 1912 he served as chief of the division of militia affairs on the general staff.

MILLS, CHARLES KARSNER (1845-). An American neurologist, born in Philadelphia and educated at the Central High School and the medical department of the University of Pennsylvania. He began to practice in 1869; was professor of diseases of the mind and nervous system at the Philadelphia Polyclinic (1883-98) and clinical professor of nervous diseases at the Women's Medical College of Pennsylvania. At the University of Pennsylvania he served as professor of mental diseases and medical jurisprudence (1893-1901), clinical professor of nervous diseases (1901-03), and professor of neurology after 1903. He attained a high reputation as an alienist. Besides monographs on mental and nervous strain, he published: *Practical Lessons in Nursing* (new ed., 1904); *Physiology and Hygiene* (rev. ed., 1904); *The Nursing and Care of the Nervous and Insane* (new ed., 1912); and edited a valuable *Treatise on the Nervous System and its Diseases* (1898).

MILLS, CLARK (1815-83). An American sculptor, born in Onondaga Co., N. Y. In his youth he followed the trade of a plasterer, at the same time modeling ideal heads in clay. Although entirely self-taught and without knowledge of professional methods, in 1846 he completed a marble bust of John C. Calhoun, which was purchased by the city of Charleston for the city hall. In 1848 he furnished a design for an equestrian statue of General Jackson, to be placed in Lafayette Square, Washington. There being no bronze foundry for such work in the United States, Mills erected in Washington an experimental foundry, where in 1852 he succeeded in producing a perfect cast. It was formally accepted Jan. 8, 1853, and, although without artistic value, is interesting as the first equestrian statue in American sculpture. He was next engaged on the colossal equestrian statue of Washington, which was formally unveiled in the national capital Feb. 22, 1860. Mills's last work was the casting (1863) of Crawford's colossal statue of Liberty, which crowns the dome of the Capitol at Washington. Compared with present-day sculpture the work of Mills seems inferior and mechanical, but it marks a stepping-stone in the advance of American art.

MILLS, DARIUS OGDEN (1825-1910). An American financier and philanthropist, born at North Salem, N. Y. He was a clerk in New York City and served as a bank cashier at Buffalo, N. Y., in 1847-49. In 1849 he went to California, where he became a merchant and dealer in exchange at Sacramento and founded the bank of D. O. Mills & Co. In 1864-67 he was president of the Bank of California, San Francisco; and after the failure of that institution under his successor Mills reestablished it on a sound basis. In 1880 he moved to New York City, where he erected the Mills Building on Broad Street and where he became identified with a variety of interests, as trustee of the Metropolitan Museum of Art, the American Museum of Natural History, and the American Geographical Society, and as president of the New York Botanical Gardens. In 1868-80 he was regent and treasurer of the University of California, in which he endowed a chair of philosophy; and he was also trustee of the Lick estate and Observatory. Mills gave extensively to philanthropic objects. The three Mills hotels

in New York, where poor but self-respecting men may obtain meals and lodgings at a nominal price, stand as a monument to his wise benevolence. They proved especially successful and attracted wide attention among charity workers and social investigators. At the time of his death Mills possessed a fortune of \$35,000,000. His daughter married Whitelaw Reid (q.v.).

MILLS, DAVID (1831-1903). A Canadian statesman and jurist. He was born in the township of Orford, Kent Co., Ontario, was educated at the local schools, and graduated in law at the University of Michigan in 1855. After teaching for a time he was school superintendent for Kent County until 1865. Entering political life at Confederation in 1867, he was elected Liberal member for Bothwell in the first Dominion Parliament and, with the exception of one legislative session (1882), retained his seat in the House of Commons until 1896. He edited the London (Ontario) *Daily Advertiser* in 1882-87, was called to the Ontario bar in 1883, and was soon afterward employed by the Ontario government in several important cases. He became an authority on constitutional and international law and in 1888-1900 was professor of these subjects in Toronto University. He was Minister of the Interior (1876-78) in the administration of Alexander Mackenzie (q.v.), was called to the Senate in 1897, and was Minister of Justice (1897-1901) in the administration of Sir Wilfrid Laurier (q.v.). In 1901 he was appointed a judge of the Supreme Court of Canada, which position he retained until his death. As a private member of Parliament (1879-96) Mills advocated measures for better securing the independence of the electorate, and in 1895 made a motion in the House of Commons to reform the Senate. He published: *Report on the Boundaries of Ontario* (1873); *The Canadian View of the Alaskan Boundary Dispute* (1899); *The English in Africa* (1900); and many magazine articles on political and economic subjects.

MILLS, HIRAM FRANCIS (1836-). An American hydraulic and sanitary engineer, born at Bangor, Me. After graduating C. E. from the Rensselaer Polytechnic Institute in 1856 he was engaged in engineering work on the Bergen (N. J.) tunnel of the Erie Railroad (1858), on the Brooklyn water works (1859), at Cohoes, N. Y. (1859), and, under the noted hydraulic engineer, James B. Francis, at Lowell, Mass. (1860-63). For the next six years he was employed on important railroad, dam, and water-power works, including the Hoosac Tunnel on the Fitchburg Railroad, Massachusetts. In 1869 he began a long career in the control of water power on the Merrimac River, first at Lawrence and later at Lowell as well. He served as chief engineer of the Essex Company at Lawrence after 1869, and as consulting engineer of the Proprietors' Locks and Canals at Lowell in 1893, becoming chief engineer in 1894. In 1901 he was appointed consulting engineer of the Boston Metropolitan Water and Sewerage Board. From 1886 to its dissolution in 1914 he was engineer member of the Massachusetts State Board of Health, chairman of its committee on water supply and sewerage, and directed the Lawrence Experiment Station investigations of water and sewage purification, known throughout the sanitary world. In 1892-93 he designed and built the slow sand filters of the water works of Lawrence, Mass.; these marked a new

era in water purification. After 1868 he served as consulting engineer on various other works in the United States and Mexico.

MILLS, JAMES (1840-). A Canadian educator and railway administrator. He was born near Bond Head, Ontario, and was educated at Victoria University, where he graduated at the head of his class in 1868. He taught successively at Stanstead (1868-69), Cobourg (1869-72), and Brantford (1873-79), gaining high rank in his profession. He was appointed president of the Ontario Agricultural College at Guelph in 1879, in which position he remained for 25 years, bringing the college to a high state of efficiency. As its president and the organizer for 10 years of farmers' institutes he did eminent service for agricultural education in Ontario. He was a member of the San José Scale Commission (1899). In 1904 he was appointed a member of the Board of Railway Commissioners for Canada. He was a member of the board of regents, Victoria University (1890-1910), and was also appointed a senator of Toronto University. With Thomas Shaw he wrote *First Principles of Agriculture* (1890).

MILLS, LAWRENCE HEYWORTH (1837-1918). An English Orientalist. He was born in New York City and graduated at the University of the City of New York (now New York University) in 1857. He then studied for orders at the Fairfax County Episcopal Seminary near Alexandria, Va., and was ordained in 1861, after which he held a charge in Brooklyn until 1867. Retiring from the ministry, he went to Europe in 1872, where he devoted himself first to a study of Gnosticism and then to the Avesta, which was to prove his life work. In 1887, at the request of Max Müller, he went to Oxford, where in 1898 he was made professor of Zend philology. Mills's researches were concerned mainly with the older portion of the Avesta texts, the Gâthâs (q.v.), which he studied exhaustively, adhering in the main to the system of the traditional school of interpretation. He also published many contributions on the early phases of Zoroastrianism, and must be regarded as one of the foremost of Iranian scholars. Among his works are: "Zend Avesta, part iii," in Müller, *Sacred Books of the East*, vol. xxxi (Oxford, 1887); *Study of the Five Zarathushtrian (Zoroastrian) Gâthâs* (1894); *Gâthâs of Zarathushtra (Zoroaster) in Metre and Rhythm* (1900); *Dictionary of the Gâthic Language of the Zend-Avesta* (1902-14); *Zoroaster, Philo, the Achæmenids, and Israel* (2 vols., 1904-06); *Avesta Eschatology Compared with the Books of Daniel and Revelations* (1908); *Yasna I, with Avesta, Sanskrit, Pahlavi, and Persian texts* (1910); *Our own Religion in Ancient Persia*, lectures delivered at Oxford (1913); *Lore of Avesta in Catechetical Dialogues* (1914).

MILLS, ROBERT (1781-1855). An American engineer and architect. He was born in Charleston, S. C., and studied under Benjamin H. Latrobe. He erected several customhouses and marine hospitals, and in 1820 was appointed State architect and engineer of South Carolina. In 1836 President Jackson made him the official architect of the United States government and supervising architect of the Capitol; this office he held until 1851. Under this and the next administration Mills designed and had charge of the erection of the Treasury Building, the General Post Office, the Patent Office Building, and the National Washington Monument.

MILLS, ROGER QUARLES (1832-1911). An American soldier and statesman, born in Todd Co., Ky. He removed to Palestine, Tex., in 1849, studied law while acting as clerk in the post office, and at 20 was admitted to the bar. He was elected to the Texas House of Representatives in 1859, but entered the military service of the Confederacy at the outbreak of the Civil War and took part in the battles of Arkansas Post (Jan. 11, 1863), Chickamauga (Sept. 19-20, 1863), where he commanded a brigade, New Hope Church (May 27, 1864), and Atlanta (July 22, 1864). In 1873 he was elected to Congress, where he continued as a member of the House until 1892, when he was chosen to fill an unexpired term in the Senate, and the next year was reelected for the full term. As a Representative, he bitterly opposed the Electoral Commission resolution, claiming that Tilden was constitutionally elected. In 1884-88 he was chairman of the House Committee on Ways and Means, in which capacity he drafted in 1888 the Cleveland administration tariff act, the so-called Mills Bill, which made important reductions in existing rates and was famous as a party measure. Since the Republicans controlled the Senate, it failed of enactment, as was expected.

MILLS, SAMUEL JOHN (1783-1818). An American missionary. He was born at Torrington, Conn., April 21, 1783, and graduated at Williams College in 1809. While in college he first suggested to a group of students the project of foreign missions, at a meeting for prayer by a haystack near the college. After spending a short time in the study of theology at New Haven he entered Andover Theological Seminary in 1810. With Judson, Hall, Newell, and Nott he united in a memorial to the General Association of Massachusetts (Congregational), which resulted in the formation of the American Board of Commissioners for Foreign Missions. He was licensed to preach in 1812 and spent two years in mission work in the Southern and Western States. He suggested the formation of a national Bible society, which resulted in the organization of the American Bible Society. To him was due the formation of the United Foreign Mission Society. Through his exertions in conjunction with Dr. Finley the American Colonization Society was formed in 1817 and he was appointed with Dr. Burgess to visit England in behalf of the society and to explore the west coast of Africa for a suitable site for a colony of colored people from America. He sailed in November, 1817, and arrived on the coast March 12. He embarked for the United States, May 22, 1818, and died at sea June 16. He is called the "father of foreign missions in America." Consult the memoir by Spring (New York, 1854), and T. C. Richards, *Samuel J. Mills* (Boston, 1906).

MILLS, SEBASTIAN BACH (1838-98). An Anglo-American piano virtuoso and teacher, born at Cirencester in England. He was trained by his father and under Potter and Sterndale Bennett and was regarded as the most precocious child musician in Great Britain. He completed his musical education under Moscheles, Plaidy, and the other distinguished teachers of the Leipzig Conservatory. After leaving Leipzig he studied for a period under Liszt, who held him in high estimation. He returned for a little while to England, where he held the appointment of organist at the Roman Catholic cathedral at Sheffield (1855). Three

years later he returned to Germany and played at a Gewandhaus concert (Dec. 2, 1858). The following year he appeared in New York under the auspices of the Philharmonic Society and thereafter made his home in America. He was very successful as a teacher and as a concert pianist was as popular in Germany as in the United States. His compositions are few and comparatively unimportant. He died at Wiesbaden.

MILLS, THOMAS WESLEY (1847-1915). A Canadian physiologist and educator. He was born at Brockville, Ontario, and was educated at Toronto University, and in medicine at McGill University, afterward studying in England and Germany. At McGill University he was successively demonstrator of (1882-84), lecturer in (1884-86), and professor of (1886-1910), physiology. In 1910 he was made professor emeritus of physiology in the same university. He was one of the founders of the Society for the Study of Comparative Physiology (1885). Among his publications are: *A Text-Book of Animal Physiology*, etc. (1889); *A Text-Book of Comparative Physiology* (1890); *How to Keep a Dog in the City* (1891); *The Dog in Health and Disease* (1892); *The Nature and Development of Animal Intelligence* (1898); *Voice Production in Singing and Speaking on Scientific Principles* (1906).

MILLS COLLEGE. A college for women, with a campus of 150 acres, in the suburbs of Oakland, Cal. It was founded as a seminary in 1865 and chartered as a college in 1885. In May, 1911, the seminary department was discontinued. Its entrance requirements are those of any standard college, and the degrees granted are A.B., B.L., and B.S. In addition to the regular departments of liberal culture it offers special opportunity for work in home economics, physical education, music, and fine arts. In 1914-15 the students numbered 137 and the faculty 32. The endowment of the college is \$500,000 and the value of the property \$500,000. The president in 1915 was Luella C. Carson, LL.D.

MILL SPRINGS, BATTLE OF. A battle fought at Mill Springs, Ky., about 10 miles west of Somerset, on Jan. 18, 1862, between a Federal force of about 4000 men under Gen. George H. Thomas and an approximately equal Confederate force under Gen. George B. Crittenden. The Confederates attacked with great energy, but were finally driven in some confusion from the field. The engagement is also sometimes called the battle of Fishing Creek and the battle of Logan's Crossroads. On the battleground a national cemetery was subsequently established, where 718 soldiers lie buried, 352 known and 366 unknown.

MILL/STONE. A wheel or circular mass of rock used in grinding wheat and other grains. For good millstones the rock must be tough, hard, and possess a cellular structure so as to maintain a rough grinding surface. Several varieties of rocks have been found to possess these qualities in a greater or less degree and have been extensively employed for millstones. In the United States the rock most commonly used is a coarse granular sandstone, which is obtained in Ulster Co., N. Y., in Lancaster Co., Pa., and in Montgomery Co., Va. The celebrated French buhrstones consist of a cellular chert occurring in the Tertiary of the Paris basin. The German millstones are largely quar-

ried from a sheet of basaltic lava found near Cologne. The foreign stone is imported into the United States in small pieces and is then built up into wheels, while the domestic stone is quarried and dressed to form a solid wheel. The introduction of the roller process for the manufacture of flour has curtailed the use of millstones to a great extent. In 1913 the production of millstones in the United States was valued at \$56,163. See ABRASIVES.

MILLSTONE GRIT. A hard siliceous conglomerate with quartz pebbles. Its geological position is at the base of the Pennsylvanian (Coal Measures) series of the Carboniferous system. The beds along the Appalachian Range in Pennsylvania are very coarse and are over 1200 feet thick. The rock here is a light-colored siliceous conglomerate known as the Pottsville Conglomerate, interstratified with some sandstone and thin beds of carbonaceous shells. The formation is represented also in New York and as far south as Alabama. Thin beds of coal are found in it in Pennsylvania, and in the southern Appalachians the coal beds are very important. See CARBONIFEROUS SYSTEM.

MILLVALE. A borough in Allegheny Co., Pa., on the Allegheny River, opposite Pittsburgh, with which it is connected by bridge, and on the Pennsylvania and the Baltimore and Ohio railroads (Map: Pittsburgh, F 2). It has iron manufactures, saw works, stone works, lumber mills, breweries, etc. The government is vested in a burgess, elected every three years, and a borough council. The water works and electric-light plant are owned by the municipality. Pop., 1900, 6736; 1910, 7861.

MILL VALLEY. A town in Marin Co., Cal., 12 miles north of San Francisco, on the Northwestern Pacific and the Muir Woods and Mt. Tamalpais Scenic railroads (Map: California, C 5). It is situated in a region of remarkable scenic beauty and adapted to fruit growing. Mill Valley owns its water works. Pop., 1910, 2551.

MILLVILLE. A city in Cumberland Co., N. J., 40 miles south of Philadelphia, on the Maurice River, at the head of deep-water navigation, and on the Pennsylvania Railroad (Map: New Jersey, B 5). It has city and high-school libraries, a fine high-school building, a hospital, and a large public park at Union Lake, a beautiful sheet of water 3 miles long and $1\frac{1}{2}$ in width. Millville is essentially a manufacturing centre, having extensive glass factories, iron foundries, cotton mills, wrapper and shirt-waist factories, and bleach and dye works. The city has adopted the commission form of government. Millville was incorporated as a town in 1801 and was chartered as a city in 1866. Pop., 1900, 10,583; 1910, 12,451; 1914 (U. S. est.), 13,246; 1920, 14,691.

MILMAN, HENRY HART (1791-1868). An English poet and ecclesiastical historian. He was the youngest son of Sir Francis Milman, physician to George III, and was born in London, Feb. 10, 1791. He was educated at Eton and afterward at Brasenose College, Oxford, where he obtained the Newdigate prize with an English poem on the Apollo Belvedere in 1812 and graduated B.A. in 1814. He published *Fazio, a Tragedy*, which was successfully brought upon the stage at Covent Garden in 1815; took orders in 1817, and in 1818 was appointed vicar of St. Mary's, Reading. In 1818 appeared his *Samor, Lord of the Bright City, an Heroic*

Poem, which was followed in 1829 by the *Fall of Jerusalem*, a dramatic poem with some fine sacred lyrics interspersed. In 1821 Milman was chosen professor of poetry at Oxford and held the position for 10 years. He published three other dramatic poems, *The Martyr of Antioch* and *Belshazzar*, both in 1882, and *Anne Boleyn* in 1826. His Bampton lectures on *The Character and Conduct of the Apostles Considered as an Evidence of Christianity* appeared in 1827 and his *History of the Jews* (3 vols.) in 1830. The last of these works did not bear the author's name. Its weak point was a want of adequate learning, especially in the department of biblical criticism, but its fresh, natural treatment of biblical history was a novelty and was severely attacked as heresy. A new edition, greatly improved and more critical, was published in 1863, and another, with further improvements, in 1867. He became a canon of Westminster and rector of St. Margaret's, Westminster, London, in 1835, and the same year he published certain translations of Sanskrit epic poetry. In 1840 appeared a collected edition of his *Poetical Works*, containing some other pieces besides those already mentioned. The same year witnessed the publication of his *History of Christianity from the Birth of Christ to the Abolition of Paganism in the Roman Empire* (3 vols.). In 1849 he was made dean of St. Paul's and discharged the duties of the office in such a manner as to win the title of "the Great Dean." In 1854-56 he published his masterpiece, *History of Latin Christianity, Including that of the Popes to the Pontificate of Nicholas V* (6 vols.), a work whose candid, sympathetic scholarship made an era in the study of ecclesiastical history in England. Milman edited Gibbon (1838) and an edition of Horace (1849), and published translations of the *Agamemnon* and *Bacchæ* (1865). He contributed extensively to the *Quarterly Review*. He died in Sunninghill, near Ascot, Sept. 24, 1868. A posthumous work contains his *Annals of St. Paul's Cathedral* (1868) and another *Essays on St. Paul, Savonarola, Erasmus, etc.* (1870). His historical works were republished in 15 volumes (1866-67). Consult his biography by A. Milman (London, 1900).

MILMORE, MARTIN (1844-83). An American sculptor. He was born at Sligo, Ireland, and in 1851 was taken to Boston. His first instruction was in wood carving, but in 1860 he began his studies in sculpture with Thomas Ball in Boston. His first work to receive notice was his ideal alto-relievo "Phosphor" (1863). In the same year he executed the statuette "Devotion" and later an ideal child statue and cabinet busts of Longfellow and Charles Sumner. In 1864 he was commissioned to execute statues of Ceres, Flora, and Pomona for Boston Horticultural Hall (Tremont Street). One of his most effective pieces is his soldiers' monument for Forest Hills Cemetery, Roxbury (1867), which ranks high among American works of art for conception and execution. The Soldiers' and Sailors' Monument on Boston Common, unveiled in 1874, is his greatest and most elaborate work and gives proof of an unusual sense of the monumental. While preparing designs for this work he resided at Rome, where he made busts of Pope Pius IX, Wendell Phillips, and Ralph Waldo Emerson. He died in Roxbury, Mass. Among other works are his life-size bust of Charles Sumner, Metropolitan Museum, New

York City; a statue of General Thayer, West Point, N. Y.; busts of General Grant, Lincoln, Daniel Webster, and others; war monuments at Keene, N. H., Erie, Pa., and Charlestown and Fitchburg, Mass. With his brother he executed the great granite Sphinx in Mount Auburn Cemetery, Cambridge, Mass. It was in commemoration of Milmore that Daniel Chester French modeled his celebrated bronze relief "Death and the Young Sculptor."

MILNE, miln, JOHN (1850-1913). An English mining engineer and seismologist, born in Liverpool. He was educated at King's College and the Royal School of Mines in London and subsequently went to Newfoundland and Labrador, where he worked as a mining engineer. Later he was the geologist of Dr. Beke's expedition into northwestern Arabia, and was then for 20 years in the service of the Japanese government. During that period he established the seismic survey of Japan, which comprises more than 900 stations and which may be said to have inaugurated the systematic study of earthquake phenomena. In the course of his investigations he traveled over a great part of the world, visiting the United States, Russia, Siberia, Mongolia, Korea, China, the Kuriles, the Philippines, Borneo, and Australasia, and finally devoted himself to the establishment of a seismic survey of the world. He invented seismographs and instruments to record vibrations on railways, and published important works on seismology and geology, including *Earthquakes and Other Earth Movements* (1883; 6th ed., 1913); *Seismology* (1888); *The Miner's Handbook* (1894; 3d ed., 1902); *Crystallography*.

MILNE-EDWARDS, miln-éd'wardz, *Fr. pron. mēlnā'dwār*, ALPHONSE (1835-1900). A French zoologist, son of Henri Milne-Edwards, born in Paris. Though he took the degree of M.D. in 1860 he devoted his life to the study of zoology and, after holding various minor positions, was appointed professor of zoology in the Museum of Natural History, Paris, in 1876, becoming director in 1892. His earlier publications were in physiological medicine, but the greater part of his work was done in zoology, paleontology, and deep-sea exploration. His work on fossil Crustacea appeared in 1865; an extensive and valuable treatise on the fossil birds of France was published in 1866-72. He also described the extinct birds of the Mascarene Islands and of Madagascar. He worked long and patiently on the Crustacea, preparing elaborate reports on the deep-sea forms. His publications include: *Histoire des crustacés podophthalmes fossiles* (1865); *Recherches anatomiques et paléontologiques pour servir à l'histoire des oiseaux fossiles de la France* (2 vols., 1867-72); *Expéditions scientifiques du travailleur et du talisman* (1888).

MILNE-EDWARDS, HENRI (1800-85). A French naturalist, born at Bruges. His father was an Englishman. He studied medicine, but after taking his degree in 1823 turned to the study of zoology and began his scientific career by publishing, in 1828, his *Recherches anatomiques sur les crustacés*. In 1841 he was appointed professor of entomology at the Museum of Natural History, Paris. In 1862 he succeeded Geoffrey St. Hilaire in the chair of zoology and in 1864 became director. From 1837 on he edited the zoological portion of the *Annales des sciences naturelles* and contributed extensively to this journal. He was the first to describe the

important biological principle of the physiological division of labor. His most important works besides the *Recherches* above mentioned were: *Éléments de zoologie ou leçons sur l'anatomie, la physiologie, la classification, etc., des animaux* (1834-35; republished as a new edition with the title *Cours élémentaire de zoologie*, 1851); a completion and revision of Lamarck's *L'Histoire naturelle des animaux sans vertèbres* (1836-45), with Deshayes; *Leçons sur la physiologie et l'anatomie comparées de l'homme et des animaux* (1855-84).

MILNER, ALFRED, first VISCOUNT (1854-). An English colonial Governor, born at Bonn, Germany, March 23, 1854. He studied at Tübingen, at King's College, London, and at Balliol College, Oxford, studied law, and from 1882 to 1885 devoted himself to journalism, serving under John Morley and W. T. Stead. His service as private secretary to G. J. (afterward Lord) Goschen, Chancellor of the Exchequer (1887-89), began his public career. He proved an able Undersecretary for Finance in Egypt (1889-92), publishing his observations as *England in Egypt* (1892; 12th ed., 1915), and was chairman of the Board of Inland Revenue in 1892-97. In 1897 Milner was appointed High Commissioner for South Africa and Governor of the Cape of Good Hope. He held the former post through the difficult period preceding and succeeding the South African War; was created Viscount in 1902, and in 1901 was appointed Governor of the Transvaal and Orange River Colonies. He resigned as High Commissioner and Governor in March, 1905, and returned to England. Regarded by many as coauthor with Cecil Rhodes and Mr. Chamberlain of the South African War, he was subjected to much criticism in Liberal circles, especially after the fall of the Unionist ministry in December, 1905. In March, 1906, the House of Commons expressed in an indirect way its disapproval of his action in permitting the flogging of a Chinese coolie in the Transvaal. In reply the House of Lords, by an overwhelming vote, placed on record its high appreciation of Lord Milner's services, and in August he was presented with an address of the same nature signed by more than 370,000 names. He published *The Nation and the Empire* (1913). Consult: E. B. Iwan-Müller, *Lord Milner and South Africa* (London, 1902); W. B. Worsfold, *Lord Milner's Work in South Africa* (ib., 1906); id., *The Reconstruction of the New Colonies under Lord Milner* (2 vols., ib., 1913).

MILNER, JOHN (1752-1826). An English Roman Catholic scholar, born in London. He was ordained priest in 1777; settled at Winchester in 1779; became titular Bishop of Castabala in 1803, and was made Apostolic Vicar of the Midland District in England. In 1804 he moved to Wolverhampton and entered into the agitation which finally led to the removal of the right of veto on appointment of Roman Catholic bishops as part of Peel's Catholic Relief Act passed in 1829. His firmness and courage in the controversy won him the sobriquet "the English Athanasius." He wrote: *Antiquities of Winchester* (2 vols., 1798-1801; 3d ed., with memoir by Husenbeth, 1839); *Treatise on the Ecclesiastical Architecture of England during the Middle Ages* (1811; 3d ed., 1835); *The End of Religious Controversy* (1818). Consult: F. C. Husenbeth, *Life of John Milner* (Dublin, 1862); Ward, *Dawn of the Catholic Revival in England, 1781-1803* (2 vols., ib., 1909).

MILNER, JOSEPH (1744-97). An English ecclesiastical historian. He was born at Leeds in Yorkshire. He studied at Catharine Hall, Cambridge, where he took the degree of B.A. in 1766, and afterward became head master of the grammar school at Hull. In 1768 he was appointed lecturer at Holy Trinity or High Church, Hull, and later became also vicar at North Ferriby, near Hull. Milner's principal work is his *History of the Church of Christ*, of which he lived to complete three volumes, reaching to the thirteenth century (1794-97); vols. iv and v (1803-09) were edited from his manuscripts by his brother, Dr. Isaac Milner, dean of Carlisle, who also published a complete edition of his brother's works in eight volumes (1810). The principles on which the *History of the Church of Christ* is written are of the narrowest kind of evangelicalism. An improved edition by Grant-ham appeared in 1847. A life of Milner by his brother Isaac is prefixed to the first volume of Milner's *Practical Sermons* (London, 1804-23).

MILNER-GIBSON, THOMAS. See GIBSON, THOMAS MILNER.

MILNES, miln'z, RICHARD MONCKTON, BARON HOUGHTON (1809-85). An English poet and politician, son of Robert Pemberton Milnes, of Fryston Hall, near Wakefield, Yorkshire, born in London, June 19, 1809. He was educated at Trinity College, Cambridge, where he was a member of the famous society called the Apostles, which included Hallam and Tennyson. Soon after receiving the degree of M.A. (1831) he traveled in Germany and Italy and visited Greece. He returned to London in 1835. In 1837 he entered Parliament for Pontefract, which he continued to represent till 1863, when he was raised to the peerage as Baron Houghton. In politics he was at first a Conservative, but on Peel's conversion to free trade he became an Independent Liberal. He was an advocate of public education and religious equality; labored for copyright laws and the establishment of reformatories for juvenile offenders; and took a decided stand on the side of Italy against Austria. A friend of literary men, he secured a pension for Tennyson, helped Hood, and was one of the first to recognize the merits of Swinburne. In 1842-43 he visited the East and in 1875 Canada and the United States. He died at Vichy, Aug. 11, 1885. He is more memorable as a man of influence in the worlds of society and letters than as an original writer, though the delicacy and refinement of his meditative poetry has a narrow appeal. Among Lord Houghton's works are: *Memorials of a Tour in Some Parts of Greece, Chiefly Poetical* (1834); *Poems of Many Years* (1838); *Poems Legendary and Historical* (1844); *Palm Leaves* (1844). He edited *The Life, Letters, and Literary Remains of Keats* (1848). Consult his interesting *Monographs, Personal and Social* (London, 1873); *Collected Poetical Works* (ib., 1876); the character of Vavasour in Disraeli's *Tancred*; T. W. Reid, *Life, Letters, and Friendship of R. M. Milnes* (London, 1890).

MILLO. A town in Piscataquis Co., Me., 34 miles north-northwest of Bangor, on the Bangor and Aroostook Railroad (Map: Maine, D 3). The town is engaged largely in farming, and there are also manufactories of spools, long lumber, and the repair shops of the Bangor and Aroostook Railroad. Pop., 1900, 1150; 1910, 2556.

MILO. See MELOS.

MILO, or MILON (Lat., from Gk. Μίλων, *Mílōn*) of Croton, in Magna Græcia. A Greek athlete famous for his great strength, who lived, according to Herodotus, about 520 B.C. He won the prize as wrestler in six Olympian, seven Pythian, ten Isthmian, and nine Nemean games. Among other displays of his strength he is said to have on one occasion carried a live ox upon his shoulders through the stadium of Olympia and afterward to have eaten the whole of it in one day; and on another to have upheld the pillars of a house in which Pythagoras and his scholars were assembled, so as to give them time to make their escape when the house was falling. He lost his life through too great confidence in his own strength, when he was getting old, in attempting to rend a tree which woodcutters had partly split with a wedge; as the result of his first effort the wedge fell out, but when he relaxed his muscles for a fresh effort the tree closed upon his hands and held him fast until he was devoured by wolves.

MILO, TITUS ANNIUS PAPIANUS (95-48 B.C.). A Roman politician. He was born at Lanuvium and belonged to a distinguished family. Few details of his life are known till his election as tribune of the people in 57 B.C. He was then a partisan of Pompey and attempted to bring about the recall of Cicero from exile. This measure was bitterly opposed by Clodius, who, as tribune of the people, had been instrumental in passing the law condemning Cicero to exile. Milo attempted to have Clodius condemned as a violator of the public peace, but the proceedings were quashed. Both Milo and Clodius now hired a bodyguard of gladiators, and armed collisions between their retainers became almost everyday occurrences. About this time Milo married Sulla's daughter, Fausta, for her fortune. In 56 Clodius was elected curule ædile and accused Milo of being a violator of the public peace by keeping a force of armed retainers. Pompey conducted the defense of Milo, but no decision was ever reached. In 53 Milo offered himself as a candidate for the consulship. Clodius opposed the candidature of Milo, who was defended in the Senate by Cicero in a speech of which some fragments are still extant. On January 18 of the next year Milo was on his way to Lanuvium from Rome, accompanied by 300 persons, many of whom were women and children. Clodius, also with an armed company, met him near Bovillæ. Milo and Clodius passed each other without trouble; but some of Milo's followers picked a quarrel with the slaves of Clodius, who attempted to interpose and was stabbed in the shoulder by one of Milo's men. Clodius was taken to a tavern in Bovillæ, but was dragged out by the slaves of Milo and put to death. The corpse of Clodius was placed on the rostra of the Forum in Rome and a mob set fire to the Senate house. These acts of popular violence created a reaction in favor of Milo, who ventured to return to Rome. He was, however, tried for the murder of Clodius. Cicero defended him, but, intimidated by the violence of Clodius' partisans, failed to do justice to himself or to his client; Milo was condemned to exile and went to Marseilles. Later Cicero rewrote his *Oratio pro Milone*; the latter speech, still extant, has been justly admired both in ancient and in modern times. For a good account of the speech, of the death of Clodius, and the trial of Milo, consult R. W. Husband, "The Prosecution of Milo: A Case of

Homicide, with a Plea of Self-Defense," in *The Classical Weekly*, vol. viii, pp. 146-150, 156-159 (New York, 1915). In his absence he was tried and condemned on charges of violence, of bribery, and conspiracy.

In 48 he went back to Italy, without permission, to join Marcus Caelius, an expelled Senator, who was attempting to excite a rebellion in south Italy.

He was killed before a fort near Thurii. See **CLODIUS PULCHER**.

MILO, VENUS DL. See **MELOS**; **VENUS OF MILO**.

MILORADOVITCH, mē'lō-rā'dō-vīch, MI-KHAIL ANDREIEVITCH, COUNT (1771-1825). A Russian general, born in St. Petersburg. After active service in the war with Turkey and in that with Poland he distinguished himself under Suvarov in the campaign of the Austro-Russian army against the French in Italy (1799) and made the famous passage of the Alps by way of the St. Gotthard Pass into Switzerland. In 1805 he was a division commander at Austerlitz and in 1812 he fought at Borodino. In 1813 he played a prominent part at Lützen. He was made Governor of St. Petersburg in 1819, but six years afterward, as he strove to quell the Decembrist rising, he was shot dead.

MILOSH, mē'lōsh, OBRENOVITCH (1780-1860). A prince of Serbia, born in Dobrinia. He was the son of a peasant and spent his youth and early manhood as a swineherd in the service of his rich half brother Milan, who was one of the leaders in the revolt of 1804. Milosh was his lieutenant and his successor (1810), took his patronymic in place of his own, Todorovitch, and became a leader in the opposition against Kara George. After the latter fled into Austria Milosh stood his ground against the Turks for a time, then surrendered, and was made commandant or "knez" of Rudnik (1813). In 1815, as a result of brave fighting and clever diplomacy, he practically made Serbia independent. Two years afterward, having killed Kara George, he was named hereditary and supreme Prince of Serbia, a title conferred in 1827 by the National Assembly and recognized by the Porte in 1830. Several revolts came to nothing, but in 1839 he was forced to abdicate in favor of his son, Milan. The next nine years he spent in Vienna and later he settled on his estates in Serbia. In 1858 he was recalled to power by the National Assembly and recognized by the Porte in 1859. He was a man of no education, energetic, headstrong, and rather cruel; but he gave Serbia a place in European politics. For this he is known as the "father of his country." He was succeeded by his son Michael Obrenovitch III.

MILREIS, mil'rās, or **MILREA**, mil'rā (Portug., from *mil*, thousand + *reis*, pl. of *real*, small coin). Portuguese and Brazilian coins and money of account, containing 1000 *reis*. The Portuguese gold milreis is equivalent to the escudo, the monetary unit of Portugal, of which the value in United States currency is \$1.08. The Brazilian milreis, the monetary unit of Brazil, is a gold coin equal to 54.6 cents value in United States currency, but is not in general circulation. There are silver coins and paper currency of the same name, which fluctuate in value, the paper milreis being quoted by the United States Treasury Department in October, 1914, at about 25 cents United States currency.

MIL'ROY, ROBERT HUSTON (1816-90). An

American soldier, born in Washington Co., Ind. He graduated at Norwich University, Northfield, Vt., in 1843, and took part in the Mexican War as captain in an Indiana volunteer regiment. While studying law he served as a member of the Indiana Constitutional Convention in 1849-50 and in 1851 was made judge of the eighth judicial circuit of Indiana. At the outbreak of the Civil War he was made captain, in 1861 was made colonel of volunteers, and finally brigadier general in 1862. In the same year he was promoted to be a major general of volunteers after his service in West Virginia under Generals McClellan and Rosecrans. At Winchester, Va., he opposed for three days a large part of Lee's army, then attempted the invasion of Pennsylvania, and lost heavily. Though he claimed that this detention of Lee was of great advantage to General Meade, enabling him to fight at Gettysburg instead of farther north, an investigation was ordered into his conduct. The charges, however, were dismissed; but he resigned from the army. In 1868 he was trustee of the Wabash and Erie Canal, was superintendent of Indian affairs in Washington Territory from 1868 to 1874, was Indian agent from 1875 to 1885, was reappointed in the latter year, but soon lost his position by the accession to power of the opposite political party.

MILTIADES (Lat., from Gk. Μιλτιάδης). 1. A prominent Athenian of the sixth century B.C., son of Cypselus, political adversary of Pisistratus. Herodotus states (vi, 36-37) that, at the request of the Dolonians, as an aid to them against their foes, Miltiades conducted a colony to the Thracian Chersonese. Modern scholars, however, have held rather that Pisistratus, seeking trade in Thrace and along the Hellespont, sent out the colony and put Miltiades in charge to remove a rival from Athens. 2. A famous Athenian general, son of Cimon (q.v.). He became "tyrant" of the Chersonesus after his brother Stesagoras, and accompanied Darius Hystaspis in his expedition against the Scythians, about 508 B.C. (See **DARIUS I.**) He was one of those who were left by Darius in charge of the bridge over the Danube, and, when Darius failed to appear at the expected time, he advised that the bridge be destroyed and Darius left to his fate. This story, told by Herodotus, vi, 40, modern scholars doubt. Consult W. W. How and J. Wells on Herodotus, l.c. (Oxford, 1912). Afterward he took Lemnos from the Persians, but, when the Persian fleet came near the Chersonesus, fled to Athens. Being chosen one of the 10 generals of the year 490 B.C., he defeated the Persians in that year in the great battle of Marathon (q.v.). Later he was intrusted by the Athenians with a fleet of 70 ships, with which he proceeded against Paros for the purpose of avenging a private grudge. The expedition having failed, he was, on his return to Athens, condemned to pay a fine of 50 talents. Being unable to do this, he was thrown into prison, where he died of an injury received at Paros. The biography of this Miltiades by Cornelius Nepos (q.v.) is extant.

MILTIADES, SAINT, less correctly called **MELCHIADES**. Pope 311-314. He was born in Africa and his pontificate covers the eventful period of Constantine's conversion. Under him a synod was held in Rome in 313 and a decision was rendered against the Donatists (q.v.). His day is December 10.

MIL'TITZ, KARL VON (c.1480–1529). A German ecclesiastic of the Roman Catholic church, the son of a Saxon noble. He was canon at Mainz, Treves, and Meissen before he became papal chamberlain and notary in 1515. Three years afterward he was sent by Pope Leo X to Saxony on the mission to confer with Martin Luther and his protector, the Elector Frederick the Wise, in the matter of indulgences. An able and politic advocate for a compromise, Miltitz so far succeeded that Luther promised future submission, if not recantation; but though later meetings took place between the two at Liebenwerda and Lichtenberg, the hope of reconciliation was definitely abandoned on the arrival of a denunciatory papal bull. Miltitz was charged also with an investigation into the conduct of Tetzels, whom he condemned. Consult his biography by Creutzberg (Freiburg, 1907).

MIL'TON. A town and the capital of Halton County, Ontario, Canada, on the Canadian Pacific and Grand Trunk railways, about 30 miles southwest (direct) of Toronto (Map: Ontario, E 6). It has manufactories of lumber, flour, wire nails, cream, pressed brick, boots and shoes, crushed stone and lime, wood screws and rivets, carpets, nickel and silver plating, and electric motors. The town possesses two parks and owns its electric-lighting and water works. Pop., 1911, 1654.

MILTON. A town, including the villages of East Milton, Lower Mills, and Mattapan, in Norfolk Co., Mass., 7 miles south of Boston, on the Neponset River and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 3). It is an attractive residential suburb of Boston and has a public library, Milton Academy, and other institutions. In proportion to its size it is a very wealthy town, its valuation in 1914 being \$31,602,839. The crest of the highest hill (635 feet) of the Blue Hills is the site of a meteorological observatory, conducted by Harvard University. A fine view is afforded. The town has granite quarries and chocolate and cracker factories. The government is administered by town meetings. There are municipal water works. Pop., 1900, 6578; 1910, 7924. Settled in 1637, Milton was a part of Dorchester until, in 1662, it was incorporated as a separate township. It was the home for many years of Jonathan Belcher, a Colonial Governor of both Massachusetts and New Jersey, and of Thomas Hutchinson, the historian and Colonial Governor of Massachusetts. It is also the site of the famous Suffolk Resolves house. Consult Teele (editor), *History of Milton, Mass.* (Milton, 1887).

MILTON. A borough in Northumberland Co., Pa., 50 miles north of Harrisburg, on the Susquehanna River, on the Pennsylvania Canal, and on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, H 4). Its extensive manufacturing plants include car and woodworking machinery shops, rolling, flour, knitting, planing, and saw mills; washer, nut, and bolt works; and furniture, shoe, couch, nail, fly net, bamboo novelty, and paper-box factories. The borough has a public park with picturesque scenery; and a fine bridge spans the Susquehanna at this point. Settled in 1770, Milton was incorporated first in 1817. It is governed, under a revised charter of 1890, by a chief Burgess, elected every four years, and a unicameral council. Pop., 1900, 6175; 1910, 4460.

MILTON, JOHN (1608–74). An English poet. He was born in Bread Street, London, Dec. 9, 1608. His father, also named John Milton, belonged to a Roman Catholic family of yeomen living in Oxfordshire. The elder John Milton was converted to Protestantism while a student at Oxford, and as a result was promptly disinherited by his father, Richard Milton. The poet's father settled in London, where he prospered as a scrivener. The younger John Milton received instruction from his father in music, was taught by a private tutor, and was sent to St. Paul's School (about 1620), where he learned Latin, Greek, French, Italian, and some Hebrew, and read English literature. Spenser's *Faerie Queene* and Sylvester's translation of Du Bartas, which came into his hands at this time, exerted much influence on the formation of his style. In February, 1625, he proceeded to Christ's College, Cambridge. He was of less than the middle height, yet well made, with light brown or auburn hair. In bearing he was courteous and stately, though sometimes sarcastic. Owing to a quarrel with his first tutor he was rusticated for a short time in 1626, but he returned and completed the course, graduating B.A. in 1629 and M.A. in 1632. From childhood Milton had been destined for the Church, but the policy of Laud led him first to postpone taking orders and then to abandon all thought of it. He retired to his father's estate at Horton, Buckinghamshire, where he passed nearly six years (1632–38) in reading the classics and writing at intervals his choicest poems. Believing that he had it in him to write something that would live, he set out for Italy in April, 1638, wishing to fit himself still more for his future work. Probably at Bologna, which he visited in 1639, Milton wrote in excellent Italian five sonnets and a canzone wherein he expresses love for a beautiful lady of Bologna. For some time he stayed in Florence, where he visited in prison the blind Galileo. Thence he went on to Rome and Naples. As he was about to pass over to Sicily and from there to Greece, news reached him of "the civil commotions in England." He turned homeward, reaching England towards the end of July, 1639. He took a house in Aldersgate Street, London, where he received as pupils two nephews, children of an elder sister, and occupied his leisure with plans for future poems. From these pursuits he was drawn into ecclesiastical controversies, writing pamphlet after pamphlet. In June, 1643, he married, after a brief courtship, Mary Powell, then only 17 years old, the daughter of an Oxfordshire squire and Royalist. After a month the bride returned to her father's house. In the summer of 1645 they were reconciled, and he moved to the Barbican, a more commodious house for the increasing number of his pupils. His wife died in 1652, after bearing four children, of whom the one son died in infancy. A fortnight after the execution of Charles I (Jan. 30, 1649) Milton issued a memorable defense of the deed, and this led to other pamphlets which gave him European fame as a controversialist. On the establishment of the Commonwealth Milton was appointed Latin secretary to the Council of State (March 15, 1649). For this office, involving the duty of turning into Latin all foreign dispatches, he was eminently fitted. In 1652 he lost his eyesight, already long impaired, but with the aid of assistants—one of whom was Andrew Marvell—he performed the duties of his

post till the abdication of Richard Cromwell (1659). In the meantime (November, 1656) he had married a Catharine Woodcock, who died in February, 1658. She was honored by one of Milton's most beautiful sonnets (xxiii). The Restoration put an end to his active career. In 1661 he settled in Jewin Street, Aldersgate, from which he removed about two years later to a house in Artillery Walk, Bunhill Fields, his last residence. Here he fulfilled the literary task he had long ago planned and since begun. In 1663 he married a third wife, 30 years his junior, named Elizabeth Minshull. His relations with his daughters were most unhappy. Brought up in ignorance, they revolted from the service that he demanded of them—reading to him Latin, Greek, and Hebrew, which of course they could not understand. Towards the end Milton stood aloof from religious sects and services. He died Nov. 8, 1674, and was buried in St. Giles's, Cripplegate.

Milton's literary career is clearly divided by the outbreak of the Civil War and by the Restoration into three periods: (1) 1626–40; (2) 1640–60; (3) 1660–74.

First Period. Milton began writing English and Latin verse while a schoolboy. The earliest extant specimens of these exercises are paraphrases of the 114th and 136th Psalms, composed at the age of 15, and some Latin verses. To his Cambridge period belong a group of Latin poems (1626–28); "On the Death of a Fair Infant" (1626); "At a Vacation Exercise" (1628); "Hymn on the Morning of Christ's Nativity" (1629); the fragment "The Passion" and "Song on May Morning" (both probably 1630); "On Shakespeare" (1630); and sonnets "To the Nightingale" (probably 1630) and "On Arriving at the Age of Twenty-three" (1631). The Latin verses are undoubtedly the best ever written by an Englishman, and the best of the English poems display high poetical genius. While at Horton, Milton composed four perfect poems: the two descriptive lyrics, "L'Allegro" and "Il Penseroso" (probably written in 1632); "Comus," a masque performed at Ludlow Castle on Michaelmas night, 1634, in honor of Lord Bridgewater's appointment to the wardenship of the Welsh marches; and "Lycidas," a pastoral elegy in memory of his college friend Edward King, drowned on his passage to Ireland (Aug. 10, 1637). Of these poems, which by themselves would give Milton a high place in English literature, only a few had been published. The lines on Shakespeare appeared in the second folio of the dramatist's works (1632); Henry Lawes, who composed the music for "Comus," published the masque anonymously (London, 1637), and "Lycidas" formed one in a collection of memorial poems (Cambridge, 1638). To this period belong five sonnets and a canzone in Italian and Milton's two finest Latin poems: "Mansus" (1638), addressed to the Marquis of Manso, the friend of Tasso, who in his old age hospitably received Milton at Naples; and "Epitaphium Damonis," an elegy on the death of his college friend Charles Diodati.

Second Period. For full 18 years Milton was distracted from poetry by the revolutions in church and state, and doubtless also by his own domestic perplexities. The separation from his wife led to pamphlets on divorce, of which the most important are "The Doctrine and Discipline of Divorce" (Aug. 1, 1643) and "The Tetrachordon" (1645). Against episcopacy he

launched, in 1641–42, five tracts, of which the best known is "The Reason of Church Government Against Prelaty." In 1644 appeared the valuable letter "Of Education" and a noble plea for the freedom of the press under the title "Areopagitica." The execution of Charles I and the establishment of the Commonwealth were defended against continental criticism in "The Tenure of Kings and Magistrates" (1649), "Eikonoklastes" (1649), "Pro Populo Anglicano Defensio" (1651), and sequels. These tracts, vehement and often scurrilous in style, contain autobiographical passages of interest. Throughout this period Milton wrote almost no verse. He composed, however, at intervals his magnificent sonnets, as "On his Blindness," "To Fairfax," "To Cromwell," and "The Massacre in Piedmont"; and the first edition of his collected poems was published, probably early in January, 1646, though dated 1645. Besides this he wrote some Greek and Latin verse and made a few translations. In 1648 there appeared a romance in Latin, in mixed prose and verse, and entitled "Nova Solyma," which was translated (New York, 1902) by the Rev. Walter Begley, and by him attributed to John Milton—an attribution which has not been generally sanctioned, however, by scholars.

Third Period. The great epic that Milton now composed is the spiritual summary of his life of lost ideals. As early as his return from Italy, he had meditated the production of some great poem. By 1642 his mind was turning towards a play on the loss of paradise. When he resumed the subject in 1658, it took the form of an epic. "Paradise Lost," in 10 books, completed by 1665, perhaps even by 1663, was first published in 1667. After several reprints with slight changes, it was enlarged to 12 books (1674). For this poem, of which 1300 copies were sold in 18 months, Milton received from his publisher £5 down, and an agreement to pay the poet £15 more in three installments on condition of the sale of a certain number of copies. At the suggestion of Thomas Ellwood, a Quaker friend of the poet, Milton wrote "Paradise Regained," which was published with "Samson Agonistes," a lyrical drama, in 1671.

Once Milton was known mainly as the author of "Paradise Lost." Since the romantic revival, the minor poems, touchstones of poetic taste, have taken a secure place beside this epic. The glow and romance of the imaginative state in which the early lyrics were conceived certainly departed from Milton during the civil conflict. But as years went on his imagination became invested with sublimity. Had "Paradise Lost" been written in 1642, it would have been a perfect mystery play, as "Comus" is a perfect masque. Delayed 20-odd years it became a sonorous epic, which, though barren in places, abounds in the noblest English poetry.

Bibliography. For his biography, consult: Edward Phillips's (Milton's nephew) memoir in his *Letters of State* (London, 1694); David Masson, *Life of John Milton, Narrated in Connection with the Political, Ecclesiastical, and Literary History of his Time* (new and rev. ed., 7 vols., London, 1877–96), exhaustive and authoritative; Mark Pattison, in the "English Men of Letters Series" (New York, 1880); Richard Garnett, in the "Great Writers Series" (London, 1890); Masterman and Mullinger, *The Age of Milton* (ib., 1897); "The Earliest Life of Milton," written by a contemporary of the poet and

For works, consult: *The Poetical Works of Mr. John Milton* (London, 1695), the first complete edition of his poetry; *Poetical Works*, edited by H. J. Todd (6 vols., ib., 1801), by J. Mitford (Aldine edition, 3 vols., ib., 1832); *Prose Works*, edited by St. John, Bohn's Library (5 vols., ib., 1848-53); *Poetical Works*, edited by Keightley (2 vols., ib., 1859); *Poetical Works*, edited by Masson (Cabinet edition, with memoir and excellent and complete editorial equipment, 3 vols., ib., 1890); John Bradshaw (comp.), *Concordance to the Poetical Works of John Milton* (ib., 1894); *Facsimile of Milton's Minor Poems*, from manuscripts in Trinity College, Cambridge, edited by Wright (Cambridge, 1899); *Poetical Works after the Original Texts*, i.e., reprints, edited by Beeching (Oxford, 1900). For estimate, consult: essays by Dr. Johnson (London, 1779), T. B. Macaulay (ib., 1840), J. R. Lowell (ib., 1845); W. P. Trent, *A Short Study* (New York, 1899); Hiram Corson, *An Introduction to Works*, containing the prose autobiographical pieces (ib., 1899); the notable *Study*, by Sir Walter Raleigh (ib., 1900). The student will find of much value C. G. Osgood, *The Classical Mythology of Milton's English Poems* (New York, 1900), and L. E. Lockwood, *Lexicon to the Poetical Works of John Milton* (ib., 1902). A valuable study is that of Robert Bridges, *Milton's Prosody* (London, 1893). Concerning sources and other questions there is good matter in Marianna Woodhull, *The Epic of Paradise Lost* (New York, 1907). In 1908, on the tercentenary of Milton's birth, an exhibition of editions and portraits of Milton was held, and the *Catalogue* (London, 1908) of this exhibition is bibliographically and iconographically valuable. There is matter of interest in S. G. Spaeth, *Milton's Knowledge of Music* (New York, 1913); in J. M. Bailey, *Milton and Jakob Boehme* (Oxford, 1914); and in E. N. S. Thompson, *Essays on Milton* (New York, 1915).

MILTON COLLEGE. A coeducational institution for higher education, founded at Milton, Wis., under the auspices of the Seventh Day Baptists. The college was incorporated under its present name in 1867, and it succeeded Du Lac Academy, founded in 1844 and in 1848 renamed Milton Academy. There are on the campus four buildings devoted to educational purposes, the last of these being a gymnasium, also used as an auditorium, erected in 1911 at a cost of \$22,000. The college includes collegiate and academic departments and a school of music. In 1914-15 the total attendance in all departments was 145, with 14 members in the faculty. The value of the property owned by the college was \$200,000, the buildings and grounds being valued at \$65,000 and the equipment at \$12,000. There is an endowment of \$135,000, and the annual income is about \$12,000. In the library are about 9500 volumes and 500 pamphlets. The president in 1915 was W. C. Daland, A.M., D.D.

MILUTIN, mil-yō'tin, DMITRI ALEXEIEVITCH, COUNT (1816-1912). A Russian general and military reformer. He was born in Moscow, entered the army in his youth, and was appointed chief of staff in the Caucasus in 1856. In 1862, after submitting his programme for a reform of the Russian army, he was made Minister of War, a place he held till 1881. In 1898 he was made field marshal. Milutin wrote

on the campaign of 1839 in northern Daghestan and on Suvarov's campaign of 1799 against France—*A History of the War of 1799 between Russia and France in the Reign of Czar Paul I* (1853). The latter ranks very high among military annals.

MILUTIN, NIKOLAI (1818-72). A Russian statesman, brother of Count Dmitri. In Alexander II's reforms he took a prominent part, especially in the reorganization of credit, in the introduction of provincial institutions centring on the *mir*, in the emancipation of the serfs, and in agrarian commissions in Lithuania in 1863 and in Poland in 1864. He was Secretary of State for Poland from 1866 to 1868. He wrote on Russian military statistics. Consult Leroy-Beaulieu, *Un homme d'état russe* (Paris, 1884).

MILVIAN, or MULVIAN BRIDGE. An ancient bridge over the Tiber at Rome, built in 109 B.C. by Marcus Æmilius Scaurus, on the famous Flaminian Way (q.v.). At this bridge, in 63 B.C., Cicero caused the arrest of the ambassadors of the Allobroges, who were conspiring with Catiline, and Maxentius was drowned there after his defeat by Constantine in 312 A.D. On the foundations of the ancient bridge stands the modern Ponte Molle. Consult S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., New York, 1911).

MILWAUKEE, mil-wō'kē. The largest city in Wisconsin, a port of entry, and the county seat of Milwaukee County. It is situated in the eastern part of the State, on the west shore of Lake Michigan, 85 miles north of Chicago, and 82 miles east of Madison, the State capital (Map: Wisconsin, F 5). The city occupies an area of about 26 square miles, trisected by the Milwaukee River and its affluents, the Menominee and Kinnickinnic, all of which have been dredged and widened to permit passage into the heart of the city of large freight and passenger vessels. Much of the residence section of Milwaukee is upon a bluff rising 150 feet above Lake Michigan and 650 feet above sea level. Upon this bluff and ranging northerly and westerly from the business quarter are broad well-paved streets, characterized by shade trees and detached houses. The park and boulevard system, the graceful sweep of the bay with its prongs—North Point and South Point—projecting far into the lake, the city's proximity to well-known health and pleasure resorts, and its cluster of busy and beautiful suburbs all combine to make Milwaukee one of the most attractive of American cities. Among its suburbs are St. Francis, the seat of Pio Nino College and other Catholic institutions; West Allis, containing the State fair grounds and the immense machinery plant of the Allis-Chalmers Manufacturing Company; and Wauwatosa, the seat of a group of county institutions: almshouses, hospital, chronic insane asylum, hospital for the insane, and a children's home; here also is a national soldiers' home, occupying 400 acres of ground. A little further removed are the suburbs South Milwaukee and Cudahy, abounding in large manufacturing establishments. The park and boulevard system is a recent and rapid development. The city owns 940 acres of parks, under the control of commissioners, appointed by the mayor. The largest of these parks are Evergreen (180 acres), Washington (150 acres), Lake (125 acres), Jackson (80 acres), Mitchell (63 acres), Humboldt (46 acres), and Kosciusko (37 acres). All are beautifully laid out,

and most either include or are bordered by bodies of water. They are rendered more attractive by golf links, tennis courts, play grounds, a zoo (in Washington Park), and statues of distinguished men—Goethe, Schiller, Kosciusko, Robert Burns, Leif Ericson, Henry Bergh, and Solomon Juneau, the founder of Milwaukee. There is also a soldiers' monument on a slightly situation on Grand Avenue. Forest Home cemetery abounds in monuments of taste and beauty. Store and residence buildings were formerly constructed for the most part of cream-colored bricks, from which Milwaukee became known as "The Cream City." Vitrified brick, however, is rapidly superseding this type of block, and new and ample structures arise in marble. The Wells, Pabst, Majestic, and First National Bank buildings are instances of the city's handsome business edifices. The Marshall and Ilsley Bank building, occupied in 1913, and the Northwestern Mutual Life Insurance Company building, completed in 1914, are particularly noteworthy—the former of Ionic architecture, and the latter a stately structure with Corinthian columns and pilasters. St. Paul's church (Protestant Episcopal), the Immanuel Presbyterian church, and the Jesuit church of the Gesù are also of great beauty. A Roman Catholic archbishopric and a Protestant Episcopal bishopric have sees in Milwaukee. The United States contributes to the architecture of Milwaukee by means of a large granite post-office building; the county of Milwaukee by a brown sandstone court and records building; and the city by its municipal house or city hall, situated on a triangular plat and surmounted by a commanding tower. Other prominent features are the public library and museum, containing 288,360 volumes, and among other rarities, the notable Nunnemacher collection of fire arms; and the art gallery, founded and endowed by Frederick Layton, and containing a choice collection of modern canvases, including *The Departure of the Mayflower*, by George H. Boughton, R.A. The public schools of Milwaukee are controlled by a board of school directors, 15 in number, elected by popular vote for a term of six years. Connected with the system are schools for the blind and deaf, vocational schools, and a fresh-air school. A fine State normal school is situated in the outskirts of the city. In addition to these there are a number of parochial schools, and Concordia College (Lutheran), established in 1881; Marquette University (Jesuit), founded in 1881; and Milwaukee-Downer College and Milwaukee-Downer Seminary, founded in 1849, both for women. Milwaukee's finest hospital is St. Mary's, with a new and splendidly equipped building, situated upon a slightly bluff of Lake Michigan's shore. In its immediate vicinity is a group of eleemosynary institutions, conspicuous among which are the Wisconsin Industrial School for Girls and the Milwaukee Protestant Home for the Aged. By the water of the lake, near the foot of these buildings, begins the Lake Shore Drive, which is to be a portion of the boulevard and park system, and which will surround practically the entire urban district. Pop., 1840, 1712; 1850, 20,061; 1860, 45,246; 1870, 71,440; 1880, 115,587; 1890, 204,468; 1900, 285,315; 1910, 373,857; 1914 (U. S. est.), 408,683; 1920, 457,147. In population Milwaukee ranks as the thirteenth city in the United States.

Its executive officer is a mayor, its legislative body a board of 37 aldermen, one chosen from

each of the 25 wards and 12 at large. A treasurer, a comptroller, an attorney, seven civil judges of limited jurisdiction, and constables are also elected by the voters of the city. Various administrative boards are appointed by the mayor, subject to confirmation by the aldermen. Minor positions are filled upon examination by civil-service boards. The tax assessment is made by ward assessors, who, with the mayor, city clerk, and tax commissioner, constitute a board of review of assessment rolls.

In 1914 the bonded debt of Milwaukee was \$10,577,500 and its floating debt \$1,714,600. The statutes limit the borrowing power of the city to 5 per cent of the average assessed valuation of property for five years. While the basis of assessment prescribed by law is the full value of real and personal property, practice has fixed it at about 90 per cent of the full value. The rate in 1914 was \$13.79. During 1913 the receipts of the city from all sources were \$16,881,587. Of this amount, \$6,859,937 came from general property taxes and \$6,774,437 from sales of investments. The expenditures during the same year amounted to \$10,369,505, of which \$2,344,697 was expended for schools, \$618,142 for the police department, \$725,186 for the fire department, \$468,968 for interest on the city's debt, and \$801,074 for water works. In 1913 the assessed valuation of all property was \$460,548,763, of which \$368,664,865 was real property and \$91,883,898 personal. The water works of the city, begun in 1872, and now including 505 miles of mains, have cost Milwaukee \$7,485,000.

Milwaukee is favorably situated with reference to extensive resources of farm, mine, and forest. It enjoys the advantages of water transportation afforded by the Great Lakes, in addition to excellent railroad facilities. Among the railways that enter the city are the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the Minneapolis, St. Paul, and Sault Ste. Marie, and, by lake ferry, the Grand Trunk and the Pere Marquette. The city has become important both as a collecting and a distributing centre, and is noted also for its manufacturing enterprises. There is an excellent harbor protected by a breakwater. In the shipments eastward there is competition between the lake system of transportation and the railroads, while a considerable traffic crosses Lake Michigan and finishes its transit east by rail. In the lake commerce the shipments far exceed the receipts. The principal commodity received from the East is coal, which reaches Milwaukee by way of the lakes. The following table shows the receipts and shipments of the principal articles for the year 1913.

COMMODITIES	Receipts	Shipments
Flour..... barrels	3,161,287	3,490,922
Wheat..... bushels	7,372,650	3,986,911
Corn..... "	13,140,650	8,956,897
Oats..... "	15,972,900	13,599,348
Barley..... "	18,897,700	5,017,218
Rye..... "	3,081,100	2,397,700
Lumber..... feet	*301,830,000	*81,854,000
Coal..... tons	*5,860,263	*1,000,599

* Lake traffic only.

With respect to corn and oats the city is primarily a distributing rather than a consuming centre. It will be noted, however, that there is a marked difference between the receipts and

the shipments of barley and wheat, Milwaukee being a large consumer of these products in the milling and brewing industries. Barley is used principally in the manufacture of beer, which is one of the most notable industries of the city. No other American city enjoys so high a reputation for its beer, although the manufacture of this product is not the most important industry. In 1913 the product of Milwaukee's chief manufacturing industries, according to local figures, was valued as follows: iron, steel, and metal products, \$46,519,509; leather and shoes, \$40,569,000; meat and packing-house products, \$30,500,000; beer, \$25,381,615; and flour and mill products, \$8,412,100. The value of all manufactured products in that year was \$420,116,266.

History. Lieut. James Gorrell, an English officer who visited the site in August of 1762, writes of "Milwacky" as an Indian town with an English trader residing there. This trader may have been Alexander Henry, a native of New Jersey, who made yearly visits to Milwaukee from about 1760 to 1765. Henry was followed by Alexander La Framboise, who in 1784 had substantial holdings at the mouth of the Milwaukee River. In about 1789 two French Canadians, Jean Baptiste Mirandeau and Jacques Vieau, visited the place. Mirandeau's stay was practically continuous until his death in March, 1819. Vieau made annual visits until about 1805, when he established himself permanently. On Sept. 12, 1818, Laurent Solomon Juneau (q.v.) arrived in Milwaukee and became Vieau's clerk and later his son-in-law. Juneau is considered the first permanent white settler of Milwaukee and, with his wife, exerted a vast influence over the neighboring Potawatami and Menominee tribes. From the Indians Juneau received extensive grants of land, but in subsequent treaties with the Indians these passed to the general government. The practical extinction of the Indian titles made Milwaukee an attractive place for settlers from eastern States. Moreover, the close of the Black Hawk War in 1832 directed attention to the west shore of Lake Michigan and in 1836 settlers came in considerable numbers. At an election for local officers held Sept. 17, 1835, 39 persons voted. On Jan. 16, 1838, Milwaukee was incorporated as a village by the Territorial Legislature and eight years later was granted a city charter. Juneau was elected the first mayor.

Consult: Wheeler, *Chronicles of Milwaukee* (Milwaukee, 1861), and Buck, *Pioneer History of Milwaukee* (3 vols., ib., 1876-84), the third volume of which is entitled *Milwaukee under the Charter*.

MILYUKOV, mil'yōō-kōf', PAVEL NIKOLAEVITCH (1859-). A Russian historian and political leader, born near St. Petersburg. He studied in Moscow and was tutor in history at the university (1886-95). Banished from Russia because of his liberal views, he served as professor of history at the university of Sofia, Bulgaria, in 1897-98, traveled extensively both in Europe and in America in 1902-05, and from 1901 to 1905 was a member of the faculty of the University of Chicago. There he delivered lectures on historical and political subjects, among them a course on *Russia and its Crisis* (published 1905). He returned to Russia in that year, on the outbreak of the revolutionary movement following the St. Petersburg massacre of January 22, was imprisoned for some time, was active in forming the powerful Union of Unions

comprising the professional classes in the Empire, and was elected to the first Duma as a Constitutional Democrat. His election was annulled and he was even arrested while the Duma was in regular session, but was liberated after a month's confinement in prison. Despite this governmental reprobation, he remained the most prominent representative of the Constitutional party in that Duma and for long afterward. He was a member of the Balkan Committee of Inquiry which investigated the conduct of the War of 1913. He edited the Constitutional-Democrat organs the *Free Nation* and *Popular Rights* until they were stopped by Russian censorship, and later he became editor of the influential St. Petersburg newspaper *Retch*. Milyukov was a prolific writer. Besides contributions to magazines, he published: *Main Currents of Russian Historical Thought* (1893-95); *Sketches of the History of Russian Culture* (1895-96); *Russia and its Crisis* (1905); *Democracy and the Second Duma* (1905); *A Year of Struggle* (1907); *The Balkan Crisis and Politics* (1910).

MILYUTIN, DMITRI and NIKOLAI. See MILUTIN.

MIMAMSA, mē-mām'sā (Skt. *mīmāṃsā*, investigation, discussion). The collective name of two of the six orthodox systems of Hindu philosophy. The two Mimamsa divisions are: first, the *Pūra-mīmāṃsā*, "Prior Inquiry" or *Karma-mīmāṃsā*, "Inquiry concerning Works"; the second is *Uttara-mīmāṃsā*, "Later Inquiry" or *Brahma-mīmāṃsā*, "Inquiry concerning the Supreme Spirit," or, more commonly, simply *Vēdānta* (see VEDĀNTA). The former deals chiefly with the Vedic ritual and its significance, the latter with speculations as to the nature of the Supreme Spirit.

The reputed founder of the system is Jaimini, and the principles are embodied in a series of *Sūtras*, or aphorisms, in 12 books, discussing the sacred ceremonies of the Veda and the merit accruing from their proper performance. The oldest extant commentary on this obscure work is the *Bhāṣya* of Čabara-Svāmin, whose date is placed long after the birth of Christ. This composition in turn was critically annotated, about 700 A.D., by the great Mimamsa authority, Kumārila. An early treatise on the subject was an essay on the Mimamsa by Colebrooke in 1826, reprinted in his *Miscellaneous Essays* (London, 1873). Consult: Cowell and Gough, *The Sarva-Darśana-Samgraha of Madhava Achārya* (London, 1894); R. K. von Garbe, *Philosophy of Ancient India* (2d ed., Chicago, 1889); Max Müller, *The Six Systems of Ancient Indian Philosophy* (New York, 1903); Macdonell, *Sanskrit Literature* (London, 1913).

MIMBAR, mīm'bār. See MOSQUE.

MIME, mīm (Lat. *mimus*, from Gk. *μῖμος*, *mimos*, imitator, actor, sort of drama). A species of popular comedy among the ancients, in which scenes of common life were represented with imitative gestures and dancing, and with jocose dialogue more or less freely improvised. It was said to have been invented by Sophron of Syracuse, who wrote in the Doric-Greek dialect. Mimes were a favorite amusement of convivial parties, the guests themselves being commonly the performers. In the hands of such writers as Laberius and Publius Syrus the mime included much homely wisdom in the shape of

familiar saws and proverbial lines. In the theatres mimes came to be used later as afterpieces. The actors, themselves called mimes (*mimi*), appeared in front of the stage, without buskins or masks, but attired in patchwork cloaks (*centunculi*), as were the harlequins (q.v.) of a later day. Consult: C. J. Gysar, *Der römische Mimus* (Vienna, 1854); Patin, *Etudes sur la poésie latine* (Paris, 1875); Friedländer, *Sittengeschichte Roms*, vol. ii (Leipzig, 1890); Teuffel and Schwabe, *History of Roman Literature* (Eng. trans., London, 1900); Edmond Faral, *Mimes français du XIII^e siècle* (Paris, 1910).

MIM'ETITE. A lead arsenate and chloride closely resembling pyromorphite, occurring in yellow, brown, or white hexagonal crystals.

MIM'ICRY (from *mimic*, from Lat. *mimicus*, mime). A form of protective resemblance by which one species so closely resembles another in external form and coloring as to be mistaken for it, although the two may not be really allied and often belong to distinct families or orders. As early as 1746 Rösel von Rosenhof in his *Insekten-Belustigungen* drew attention to the resemblance which geometric caterpillars, and also certain moths when in repose, present to dry twigs, and thus conceal themselves; and afterward Erasmus Darwin, in his *Zoönomia* (1794), sketched out the subject.

Bates's Theory of Mimicry. These facts received little attention, however, until 1862, when Bates proposed a general theory to account for them. He found during many years' residence in Brazil strikingly colored butterflies belonging to the brilliantly colored family Heliconidæ, and associated with them and indistinguishable, except on close examination, certain butterflies belonging to the structurally very different family of Pieridæ; also certain swallowtail butterflies and day-flying moths. None of the mimicking insects were as abundant as the Heliconidæ they resembled. The Heliconidæ have an offensive taste and odor, in consequence of which they are immune from attacks by insectivorous animals; they fly deliberately, and they make no attempt

theory assumes that some of the Pieridæ happened at the start to resemble the primitive Heliconidæ and received a partial immunity as a result; that such Pieridæ alone survived and produced descendants of like character; and that a selection of the most heliconid-like of these followed. By a continuation of this process the pierids and the other Lepidoptera gained their present close resemblance to the Heliconidæ. The theory is a broad one and accounts for cases of mimicry in other groups of Lepidoptera as well as in other orders of animals. It is not necessary, however, to go to South America for examples of mimicry. In North America, as well as in Asia and Africa, occurs the genus *Danais*, which is also a protected form. The common American species *Anosia pleicippus* is closely mimicked by *Basilarchia disippus*, a butterfly of rather remote affinities. Three genera of Danaidæ in tropical Asia, *Euplexa*, *Danais*, and *Hestia*, are very different, but are all protected. In each genus certain species are mimicked with extraordinary accuracy by species of the genus *Papilio*.

But mimicry is not confined to the Lepidoptera. Especially well protected wasps and bees have many imitators, and there are cases of mimicry even in vertebrates.

Müller's Theory of Mimicry. In 1879 Fritz Müller, as the result of many years' observation in southern Brazil, proposed a modification of and addition to the foregoing explanation of Bates. Bates himself, when first describing the cases he observed, had suggested that they might be due to some forms of parallel variation dependent on climatic influences, and Wallace (*Island Life*, p. 255) adduced other cases of coincident local modifications of color, which did not appear to be explicable by any form of mimicry. Müller's theory is founded on the assumption that insect-eating birds only learn when young and by experience to distinguish the edible from the inedible butterflies, and in doing so necessarily sacrifice a certain number of distasteful butterflies. "Now," says Müller, "if two distasteful species are sufficiently alike to be mistaken for one another, the experience acquired at the expense of one of them will likewise benefit the other; both species together will only have to contribute the same number of victims which each of them would have to furnish if they were different. If both species are equally common, then both will derive the same benefit from their resemblance—each will save half the number of victims which it has to furnish to the inexperience of its foes. But if one species is commoner than the other, then the benefit is unequally divided, and the proportional advantage for each of the two species which arises from their resemblance is as the square of their relative numbers." Wallace, who fully accepts Müller's theory, in his statement of the theory (*Darwinism*, p. 253) adds: "But if the

at concealment, although their bright distinctive colors permit them to be recognized and avoided as obnoxious. If any other butterflies in the same region were to become indistinguishable from the Heliconidæ they would profit by a corresponding immunity from attack. The

theory assumes that some of the Pieridæ happened at the start to resemble the primitive Heliconidæ and received a partial immunity as a result; that such Pieridæ alone survived and produced descendants of like character; and that a selection of the most heliconid-like of these followed. By a continuation of this process the pierids and the other Lepidoptera gained their present close resemblance to the Heliconidæ. The theory is a broad one and accounts for cases of mimicry in other groups of Lepidoptera as well as in other orders of animals. It is not necessary, however, to go to South America for examples of mimicry. In North America, as well as in Asia and Africa, occurs the genus *Danais*, which is also a protected form. The common American species *Anosia pleicippus* is closely mimicked by *Basilarchia disippus*, a butterfly of rather remote affinities. Three genera of Danaidæ in tropical Asia, *Euplexa*, *Danais*, and *Hestia*, are very different, but are all protected. In each genus certain species are mimicked with extraordinary accuracy by species of the genus *Papilio*.

But mimicry is not confined to the Lepidoptera. Especially well protected wasps and bees have many imitators, and there are cases of mimicry even in vertebrates.

Müller's Theory of Mimicry. In 1879 Fritz Müller, as the result of many years' observation in southern Brazil, proposed a modification of and addition to the foregoing explanation of Bates. Bates himself, when first describing the cases he observed, had suggested that they might be due to some forms of parallel variation dependent on climatic influences, and Wallace (*Island Life*, p. 255) adduced other cases of coincident local modifications of color, which did not appear to be explicable by any form of mimicry. Müller's theory is founded on the assumption that insect-eating birds only learn when young and by experience to distinguish the edible from the inedible butterflies, and in doing so necessarily sacrifice a certain number of distasteful butterflies. "Now," says Müller, "if two distasteful species are sufficiently alike to be mistaken for one another, the experience acquired at the expense of one of them will likewise benefit the other; both species together will only have to contribute the same number of victims which each of them would have to furnish if they were different. If both species are equally common, then both will derive the same benefit from their resemblance—each will save half the number of victims which it has to furnish to the inexperience of its foes. But if one species is commoner than the other, then the benefit is unequally divided, and the proportional advantage for each of the two species which arises from their resemblance is as the square of their relative numbers." Wallace, who fully accepts Müller's theory, in his statement of the theory (*Darwinism*, p. 253) adds: "But if the

two species are very unequal in numbers, the benefit will be comparatively slight for the more abundant species, but very great for the rare one. To the latter it may make all the difference between safety and destruction."

The facts of mimicry are very remarkable; as to causes there is much difference of opinion. The theory of Bates is accepted by many; also that of Müller. Others, like Eimer, Elwes, and Piepers, deny that the mimicry is due to natural selection, but rather to definitely directed evolution, the result of "outward influences such as climate, nutriment, etc., acting on a given constitution." Others, rejecting the Müllerian theory, accept Bates's facts, but ascribe more to the influence of the local environment, such as the action of light, heat, dryness or moisture, etc., yet allowing that in the end natural selection may act as a preservative agent.

The objections to the Müllerian theory are the following: neither Bates nor Wallace himself, though each lived for several years and collected butterflies in the American tropics, ever actually saw a bird chase and devour a butterfly, although insectivorous birds are said by them to be abundant in Brazil and the Eastern Archipelago. Piepers, Pryor, Skertchley, and other tropical naturalists of long and intelligent experience agree that very rarely has any bird been seen even to chase a butterfly; while Judd concludes from an examination of stomachs of insectivorous birds that none of the American birds feeds upon butterflies "during any month of the year to the extent of one-tenth of 1 per cent of its food." Ornithologists confirm this abstinence from eating butterflies. From these and numerous other cases it appears that butterflies enjoy a peculiar immunity from the attacks of birds.

It is sometimes the case that it is difficult to tell which is the model and which the mimic. On the Solomon Islands a dark-brown *Euplœa* and a *Danais*, both inedible, were accompanied by a *Hypolimnas* butterfly, also inedible, all three genera being avoided by birds both in the larva and imago stages. The fact, says Packard, that the mimickers belong to more primitive groups than the models, and that they are as a rule rare and apparently on the verge of extinction, indicates that they are the relics of an earlier geological period, and having been exposed to the same local and modifying changes in the environment as the models, have thus been preserved. Most of the cases of mimicry are really cases of convergence produced by similar conditions of life. Moreover, the ground colors of butterflies are restricted in range to reds, shades of brown, yellow, white, and more rarely blue and green. Also the patterns are limited; nature has repeated them over and over again. It is no wonder that there should be apparent cases of mimicry, in regions so similar as the hot and damp forest-covered plains of Brazil or the upland hot plains of southern Africa and the deep forests of the East Indies. On the other hand, Poulton heads the defenders of the theory and in many ways makes out a most excellent case.

As authorities differ so greatly in their interpretations of the facts, the subject may be considered an open one. That the bad-tasting butterflies are not eaten by birds any more than hairy and bad-tasting caterpillars, is an acknowledged fact; that the edible species mimicking and flying with them are in very rare cases de-

voured by birds, may be allowed, but its importance as a factor in evolution has been in some quarters unduly magnified. For other cases of mimicry, see PIGMENT; PROTECTIVE COLORATION AND RESEMBLANCE.

Poulton, *Essays on Evolution* (ib., 1908); also for the most recent discussions the several papers of Poulton and Punnett in *Bedrock* (London and New York, 1912-14).

MIMIR, mē'mir. A water giant of Norse mythology, who dwelt beneath the world ash Yggdrasill and guarded a spring, considered the source of memory and wisdom and called Mimir's well. Odin in his wanderings asked for a drink from the well and was obliged in exchange to give one of his eyes, the moon, which Mimir sank deep in the spring.

MIMNERMUS (Lat., from Gk. Μίμνερμος) OF COLOPHON (or Smyrna). A Greek elegiac poet, who lived in the latter half of the seventh century B.C. His work *Nanno*, in two books, was so named from a flute player whom he had loved in vain; it is a collection of elegies that were models for later poets in sustained calmness and tender sentimentality as opposed to the political elegiac verse previously in vogue. Mimnermus is credited with having brought the elegy back to its original design of expressing personal grief, and to have been the first to make the elegy (q.v.) an expression of love; his musical temperament found the elegy a fitting medium. For the fragments, consult: Theodor Bergk, *Poetæ Lyrici Græci* (new ed., Leipzig, 1914); W. C. Wright, *A Short History of Greek Literature* (New York, 1907).

MIMOSA, mī-mō'sā (NL., from Gk. μῖμος, *mimos*, imitator). A genus of Leguminosæ (pea family) comprising about 300 species, trees, shrubs, and herbs, with bipinnate leaves, natives of the warmer and more arid regions of America, Africa, and Asia. In general, the species are called "sensitive plants," on account of their motile leaves, the leaflets of which change position rapidly if touched. The motility of the leaves is thought to be related to protection against excessive loss of water, and is an adjustment to dry regions. This remarkable power enables the plant to reduce its leaf exposure according to the needs. The species of *Mimosa* belonging to the United States are chiefly natives of the States bordering upon Mexico. The name is also applied popularly to species of the related genera *Acacia* and *Albizia*. See SENSITIVE PLANT.

MIMS, FORT. See FORT MIMS, MASSACRE OF. **MIMUS**. The Roman name for the mime (q.v.).

MIN, mēn. An Egyptian deity, the local god

of Panopolis or Akhmim (q.v.) and of Koptos (q.v.). He was the god of agriculture, typifying the generative forces of nature, and annual harvest festivals were held in his honor. He is generally represented as an ithyphallic human figure wearing a headdress of two enormous feathers and holding in his right hand a flail. Behind him is a shrine with trees upon it or near it. His sacred animal was the ram. In later times he was often identified with Ammon-Ré. The Greeks identified him with their god Pan. Consult: Adolf Erman, *Life in Ancient Egypt* (London, 1894); Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); E. A. Wallis Budge, *The Gods of the Egyptians* (London, 1904).

MINA, or **MNA** (Lat. *mina*, from Gk. *μνά*, *mna*, measure of weight, sum of money, from Heb. *māneh*, weight, from *mānāh*, to divide, measure out). A Greek weight and denomination in silver money, equal to 100 drachmas (q.v.), and the sixtieth part of a talent (q.v.). The value varied according to the talent used. The Attic mina was worth about \$18. It was used for purposes of account, and was never minted as a coin. See NUMISMATICS, *Ancient Coins—Origin—Classification*, first two paragraphs.

MINA, mē'nā, FRANCISCO ESPOZ Y (1781-1836). A Spanish guerrillero and general, born at Idocfn (Navarra), uncle of Francisco Javier Mina (q.v.), and a member of the class of yeomen. As such, and because of his democratic and radical principles, he disliked the hidalgos, but he was brave and honest, and conducted his warlike operations in as humane a manner as possible. When his nephew was captured by the French in 1810 Mina took his place as leader of a band of guerrilleros and shortly afterward he was appointed by the Junta de Aragón to the command of all the guerrilleros of Navarra. His first act was to shoot a man who was pretending to be a patriotic guerrillero but was only a bandit. The next year the government at Cadiz recognized him and in 1812 he was made commander in chief in upper Aragon. His position here made it possible for him to confiscate large quantities of war supplies that were imported by the French authorities and to levy duty on all other materials imported. With this money he paid his troops regular wages and avoided levying heavy contributions on the country, while he maintained an excellent morale among his men. In the campaigns of 1813-14 he did good service under the Duke of Wellington and was frequently wounded. Having fallen from favor when Ferdinand VII was restored, he made an unsuccessful attempt at a liberal uprising and went into exile. In 1820 he returned and served the Liberal party throughout northern Spain, offering the only serious resistance to the French, who intervened in Ferdinand's favor. In 1823 the French forced him to capitulate and allowed him to escape. Despite his having made in 1830 another attempt against Ferdinand, when the latter died Cristina recalled Mina to Spain and gave him command against the Carlists in 1835. His health was already broken, however, and he died in December of the next year, after forcing the Regent in August to grant a constitution to the country. Consult his *Memorias*, published by his widow (Madrid, 1851-52).

MINA, FRANCISCO JAVIER (1789-1817). A Spanish soldier. He was born at Idocfn, in

Navarra, took part with his uncle, Francisco Espoz y Mina, in the guerrilla warfare of 1808-09 against the French, but was taken prisoner in 1810 and detained four years at Vincennes. In 1814 he was in arms against Ferdinand VII, but was forced to flee to France. Thence he went to England, where he interested himself in the cause of the Mexican patriots, and with the aid of some prominent Englishmen organized an expedition and sailed for America. In the United States he received sympathy and substantial support, and took 200 volunteers with him, arriving at Galveston in November, 1816. Soon afterward, crossing over to New Orleans, he obtained more assistance, and after being reinforced by 100 Americans at Galveston, landed at Soto Marina, Province of Tamaulipas, April, 1817. At the head of 300 men he defeated Generals Armiñán and Ordóñez, and took the towns of León and Guanajuato with the fortress of Sombrero. Deserted by most of his followers, he was surprised on October 17 by an overwhelming force, taken to Mexico and shot, Nov. 11, 1817.

MINA BIRD. See MYNA.

MINÆANS. A Yemenite people who played an important part in the early history of Arabia. The native name was *Ma'in*; hence the Greek *Μαϊνῶν* or *Μαϊνῶν*. It is possible that the name was originally *Ma'an*, which has been identified by some scholars with *Magān*, a country southeast of Babylonia, referred to as early as the inscriptions of Naram Sin of Agade in the fourth millennium B.C. and Gudea of Lagash c.3000 B.C. But the identification is doubtful. There is good reason for supposing that the Minæans are mentioned in Judg. x. 12; in 1 Chron. iv. 41, in connection with the Amalekites against whom the tribe of Simeon made a raid in the time of Hezekiah; in 2 Chron. xxvi. 7, in connection with Philistines and Arabs in the days of Uzziah; and in Job ii. 11, where the Greek rendering suggests that Zophar was a Minean. While there are many references in the Assyrian inscriptions to Kedar, Nebayoth, Aribi, and Sheba (q.v.), there is no mention of a kingdom of *Ma'in*. Among classical writers, Eratosthenes (c.275-195 B.C.), Agatharchides (c.120 B.C.), Strabo (died c.24 A.D.), Pliny (23-79 A.D.), the *Periplus Maris Erythræi* (c.100 A.D.), and Ptolemy (second century A.D.), speak of the Minæans as one of many peoples in southwest Arabia, but have no knowledge concerning the earlier history of this nation. The fact that there was an extensive and flourishing Minæan kingdom in Arabia is known only through the native inscriptions. These have been secured chiefly through the personal efforts of Halévy, Doughty, Euting, and Glaser. Many of these inscriptions still remain unpublished. Most of them are very brief and are readily interpreted, but a few of the longer ones present considerable difficulty. As to the period from which these inscriptions come there was practical unanimity among scholars until 1889. It seemed impossible that they could be older than the earliest Sabæan inscriptions (see SABÆANS), and it was supposed that the Minæan and Sabæan kingdoms flourished side by side. Such eminent scholars as D. H. Müller, Mordtmann, Hartmann, Eduard Meyer, and Huart still adhere to this view, granting that some may be as old as the ninth century B.C., but maintaining that the bulk of them were written in the following centuries. They point out that while the

earlier inscriptions of the Sabæan officials known as *mukarrib* are written boustrophedon, there is no Minæan inscription thus running both ways; that in the famous inscription, Halévy 535, there seems to be a reference to the Medes which would place it in the sixth century; that Eratosthenes apparently knows of Minæan kings reigning at Karna, and that the name Ptolemy occurs in a Minæan inscription on an Egyptian sarcophagus. Glaser, however, in 1889, presented strong reasons for believing that the Minæan kingdom preceded the Sabæan; and Hommel, Winckler, Schmidt, Derenbourg, Margoliouth, Weber, Grimme, and Caetani have advanced arguments in favor of his position. The silence of the Sabæan inscriptions concerning a Minæan kingdom would be very strange, if these nations were for a long time powerful rivals; and the casual references to Sheba in Minæan inscriptions do not seem to harmonize with the position of this power in the centuries preceding 115 B.C. That the Assyrians make no mention of *Ma'in*, while they are frequently occupied with Sheba, apparently indicates the decline of the former and the rising importance of the latter. In its most flourishing period the Minæan kingdom extended far to the north, as is evident not only from the inscriptions found at El Oela, but also from the mention of the *Ma'inu Muzran* in Halévy 535. So extensive a kingdom with its centre in the South Arabian Jauf, where its great cities *Ma'in*, *Karnawu*, and *Yathil* were, can scarcely have existed side by side with a strong Sabæan kingdom with the neighboring *Marib* for its capital. A long inscription found at *Sirwah*, unfortunately not yet published, according to competent testimony, describes the destruction of the Minæan kingdom by a Sabæan *makrib* about 550 B.C. Sargon's (721-705 B.C.) contemporary *Itamar* is not yet designated as king. As Müller has clearly proved that the *mukarrib* preceded the kings of Sheba, the inference seems necessary that the Minæan kingdom flourished before the Sabæan *mukarrib* period and fell before the rise of the Sabæan kingdom. The Minæan system of writing shows in many respects a closer affinity to the earlier than to the later Sabæan script; and the oldest Sabæan inscriptions indicate a long period of development of the South Arabian system of writing. Hence the fact that the earliest Sabæan inscriptions are written boustrophedon does not show that this script has been recently introduced. A comparison of the language clearly manifests the higher age of the Minæan, which has preserved the *s* in the causative and in the pronominal suffixes against the *h* in the Sabæan. The identification of the *Madhay* as *Medes* is extremely doubtful; and Grimme's suggestion that it represents the people of Midian seems to possess far more probability. That the Minæans continued to exist as a people long after their power in Arabia had passed to others is evident from the Greek writers. Whether Eratosthenes drew upon older sources accessible to him in Alexandria, was imperfectly informed, or actually knew of petty kings reigning in Karna in his day, no scholar would seriously maintain that the power reflected in the Minæan inscriptions could have been exercised from Karna in the third century B.C. If the sarcophagus inscription is really Minæan rather than Hadramautian and Talmith is Ptolemy, its content shows not more clearly the survival of ancient forms, along

with some very late ones, among the Minæans of the period, than the absence of any important Minæan kingdom at that time. It therefore seems exceedingly probable that the 26 kings of *Ma'in* known from the inscriptions reigned before there was any Sabæan king in *Marib*. As it is scarcely credible that chance should have given us the name of all Minæan kings or that the 26 names represent an unbroken succession, it would be hazardous to infer that the earliest of them cannot have reigned more than four or five centuries before the last. There may have been more than one dynasty. As among the Sabæans, so in the kingdom of *Ma'in* each year seems to have been named after two *mukarrib* or high officials, like the *limmi* in Assyria, the archons in Athens, the ephors in Sparta, or the consuls in Rome. The absolute age of the Minæan kingdom cannot be determined. The early occurrence of numerous place names in southern Syria and northwestern Arabia which seem to have been transferred from Yemen, the raids of Minæans upon Palestine in the period of the Judges, and the essentially Yemenite character of the traditions brought by clans afterward forming a part of the people of Israel, from the land of Midian and the Negeb to Canaan, render it probable that kings of *Ma'in* extended their power to the borders of Palestine as early as the thirteenth century B.C. The Minæans were to a large extent a settled people living in cities, cultivating the soil, worshipping in sanctuaries. Their chief gods were a male deity, *Athtar* (see *ISHTAR*), the solar goddess *Shamsi*, *Wadd*, and *Ankari*. They had priests and priestesses, hierodules and sacred prostitutes, a sacrificial cult, and many rules of taboo. A deeper religious sense is apparent than in the period of skepticism and syncretism preceding Mohammed.

The language of the Minæans is only dialectically different from the Katabanian, Hadramautian, and Sabæan, and is closely akin to the Ethiopic and the classical Arabic. As to the origin of the system of writing used by the South Arabian peoples, it is supposed by Halévy and Lidzbarski to have been formed from the North Semitic alphabet by a modification of certain signs to denote kindred sounds and by changes rendering the signs generally symmetrical. There is indeed good reason to suppose that many new signs were added in Arabia by slight changes in those already existing, and that the characters were given a squarer form. But there are some letters that are so different from those of the North Semitic alphabet as to raise the question whether other extraneous influences may not have been at work. Whatever the relations of the various Egypto-Libyan, Mycenæan, and Anatolian alphabets, the contact of the Minæans with Egypt and the Philistine coast makes it probable that it was in the northwest rather than on the Persian Gulf that this alphabet grew up. A tablet found at Lachish shows that not only cuneiform signs but also the Mycenæan signary was to some extent used in the Philistine cities in the fourteenth century B.C. It may have been from Gaza that the Minæans brought the prototype signs of their alphabet. As our oldest inscriptions in the North Semitic alphabet, dating from the tenth and ninth centuries, show that this system of writing must have been long in use, so our earliest Minæan inscriptions indicate that the South Arabian alphabet already had a long and as yet quite obscure history of development.

See ALPHABET; ARABIA; ARABIC LANGUAGE AND LITERATURE.

MINAEV, mē-nū'ēf, DMITRI (1835-89). A Russian poet, born at Simbirsk. He was educated in a military school, and, after brief service as secretary in the Department of the Interior, from which he resigned in 1857, devoted himself to literature. His most important work was as a translator of parts of Dante's *Inferno* and of some of the works of Victor Hugo, and, among English poets, of Shelley, Byron, and Marlowe. His original works include poetry, especially satire, and a comedy, which won a prize from the St. Petersburg Academy.

MINAHAS'SAS. The natives of the Province of Minahassa in northern Celebes, called by some authorities Alfuros. A mixture of types certainly exists. Physically, the Minahassas appear to be related to the Tagals and other Philippine tribes, and there is even a suggestion of Japanese features. In point of language they are undoubtedly members of the Malay stock, but differ notably from other divisions of this family in Celebes and again approximate Philippine tribes. Since cultural evidence points in the same direction, the Minahassas may safely be considered alien immigrants from the north. The Malayan language proper has in recent years made considerable inroad upon the native dialects. Among the Minahassas women are on an equal footing with men, although from Mohammedan influences some modifications have been made upon the ancient monogamy of this people. The best account of the Minahassas in English is in Hickson, *A Naturalist in North Celebes* (London, 1889). See ALFURESE; CELEBES; MOLUCCAS.

MINAMOTO YORITOMO, mē'nā-mō'tō yō-rē-tō'mō (1146-99). A Japanese warrior and statesman who played an important part in the struggles for power of the rival military fam-

ilies, the Taira and the Minamoto, to the latter of which he belonged. His father, Yoshitomo, having been treacherously murdered in 1159 at the instance of Kiyomori, chief of the Taira clan and at that time the virtual ruler of the country, Yoritomo fled, but was captured and condemned by Kiyomori to be beheaded. Spared through the pity of the stepmother of Kiyomori, he was banished to Idzu. There he married the daughter of Hojo Tokimasa, one of his guardians in exile. In 1180, calling around him his father's scattered retainers, and securing the assistance of his father-in-law and the monks of Hiyeizan (see KYORO), he got together an army which he placed under the command of his youngest brother, Yoshitsune, and proceeded against the Taira. Five years later his enemies were utterly annihilated in a great naval battle off Dan-no-ura, near Shimonoseki. He made Kamakura his capital, was created Sei-i-tai-shogun in 1192, laid the foundations of the feudal system in Japan, and became the virtual ruler of the land—nominally under the Mikado—and the office of shogun became hereditary in the Minamoto family. He died in 1199 with his great reputation somewhat sullied by his cruel treatment of his brother Yoshitsune. See MINAMOTO YOSHITSUNE.

MINAMOTO YOSHITSUNE, mē'nā-mō'tō yō'shē-tsō'nā (1158-1189). A Japanese chieftain. Japanese history in the eleventh and twelfth centuries A.D. is concerned with the struggles of the Taira and the Minamoto clans. In 1159 Yoshitomo, the head of the Minamoto, was killed and his clan defeated. His three sons escaped, and after years of adventure defeated the Taira finally in 1185. Yoshitsune, the youngest of the three, was the lieutenant of his elder brother Yoritomo, and the most efficient warrior in his army. Yoshitsune was in command when the last battle was fought, but his success excited the jealousy of his brother, who sought his death. Escaping with 11 comrades, Yoshitsune was pursued and committed suicide in 1189. His history, with its adventures, triumphs, and tragic end, is the favorite theme of romance, poetry, and drama. In one form of the story the hero escaped with his life and found refuge among the Aino in Yezo, where he is still worshiped as a god. Another legend represents him as going to the continent of Asia and identifies him with Genghis Khan.

MIN'ARET. The tower of a mosque (q.v.). The Mohammedan call to prayer is chanted by the voice of the muezzin, who, five times daily, mounts to its upper balcony to summon the faithful with the prescribed formula. Each mosque has one or more minarets. The normal number for the largest Djami mosques is four, one at each angle of the edifice. Some have as many as six, e.g., the Ahmed mosque at Constantinople. The mosque at Mecca has the exceptional number of seven.

The usual type is a square, polygonal, or cylindrical structure of stone or brick, consisting of several stories marked by balconies, either projecting on stalactite supports or with a receding story above; it is crowned by a pinnacle or small dome. The summit is reached by a winding inner stairway; only the old stone minaret of Tulun at Cairo has an external winding staircase.

The earliest mosques had no minarets. They were first built during the seventh century, the Caliph Omar being said to have erected two, at

Kufa and Medina. Those earlier than the twelfth century were usually heavy square structures of stuccoed brick or stone without much ornament. This type is preserved at the mosque of Sidi Okba at Kairwan in Tunis. This square type persists in north Africa outside of Egypt, and was carried by the Moors into Spain. The Giralda at Seville (q.v.) is one of the largest and richest of this type, though the upper stages are a Renaissance addition. The minarets of Cairo are usually polygonal and highly ornate, with corbeled balconies and receding stages. Among the finest are those of Ibn Tulun, Hassan, Barkuk, Kalaun, Bordeni, and Kaït Bey. The Hassan mosque has two minarets; that of Kaït Bey only one.

The minarets of Egypt, Spain, Syria, India, Persia, and Turkey built between the thirteenth and sixteenth centuries are among the most original and graceful works of Eastern architecture. The Turkish type is the simplest—a cylindrical or fluted shaft with one to three corbeled balconies and a slender conical spire terminating in a gilded crescent. The Persian minarets are also cylindrical, with bulbous tops, and are veneered with brilliant ceramic tiles. Those of India show varied forms, some following Hindu models, others the Persian, but executed in marble or sandstone without tiles, as at Delhi and Agra. The most remarkable is the most ancient—the Kutub Minar at old Delhi (c.1200), a superb tower in four tapering and receding stories, each of a different star-shaped or scalloped plan. Damascus and Bagdad preserve some of their mediæval examples. The minarets of the Constantinople mosques, such as St. Sophia, Ahmed, etc., are exceedingly graceful. Sometimes the colleges, or madrasah, had minarets of style similar to those of the mosques, as in that of Sultan Husein at Ispahan, where the towers are similar to those of the great mosque of Ispahan. The height varies greatly; among the highest are the Giralda (formerly 230 feet, now 308 feet) at Seville, Kalaun (193 feet) and Hassan (280 feet) at Cairo, and the Kutub Minar, near Delhi (242 feet). See MOSQUE; and consult the bibliography of MOHAMMEDAN ART.

MINAS, mē'nāsh, more properly BELLO HORIZONTE, bē'lō ō'rē-zōn'tá. The capital of the State of Minas Geraes, Brazil (Map: Brazil, J 8). It stands on a plateau, at an altitude of 3017 feet, 60 miles northwest of Ouro Preto (q.v.), whence the capital was removed in 1897. It was founded, in 1894, upon modern plans, with wide, well-paved streets and large public gardens. Its public buildings include the post office, Law School, President's palace, Library of Congress, public market, and two theatres. It has also many fine residences. It is lighted by electricity and has an excellent supply of pure spring water. It has made a beginning of industrial life by the establishment of a few factories. Pop., 1912 (est.), 35,000.

MINAS, mē'nás. Capital of the department of the same name in Uruguay. It is picturesquely situated 55 miles northeast of Montevideo, with which it is connected by rail (Map: Uruguay, J 4). It is surrounded by well-cultivated grain-producing lands, and there are quarries of marble and granite in the neighborhood. Pop. (municipality), 1900, 8955. The city was founded in 1784.

MINAS DE RIO TINTO, mē'nás dā rē'ō tēn'to. An important mining town in southern

Spain, in the Province of Huelva, situated among the mountains, 32 miles northeast of the city of Huelva (Map: Spain, B 4). The surrounding country contains almost inexhaustible deposits of copper ore, which were exploited by the ancient Phœnicians. In 1873 the mines were taken over by a London company and the methods of obtaining the ore revolutionized. The mines now employ 10,000 workers; in 1911 the quantity of ore produced amounted to 1,603,854 tons. The town, which in 1845 had a population of only 800, numbered, in 1900, 9956, and, in 1910, 12,626.

MINAS GERAES, mē'nāsh zhā-rish'. A southeastern state of Brazil, bounded by Bahia on the north, Bahia, Espirito Santo, and Rio de Janeiro on the east, Rio de Janeiro and São Paulo on the south, and São Paulo, Matto Grosso, and Goyaz on the west (Map: Brazil, H 7). It is the fifth state of Brazil in size, having an area of 221,951 square miles. It lies wholly in the Brazilian plateau, with an average elevation of 2000 feet, and is traversed by a number of mountain ranges, which, although the highest in Brazil, are not very prominent, owing to the general elevation of the surrounding country. The principal ranges are the Serra da Mantiqueira, along the southern frontier, and the Serra do Espinhaço, running north and south through the centre of the state. At their junction is Mount Itatiaia, about 9000 feet high and the highest point in Brazil. Only the mountain ranges and the river valleys are forested; between them are extensive steppes covered only with grass and scanty shrubbery. Minas Geraes is watered by numerous rivers, including the São Francisco (with its numerous tributaries which take in the larger portion of the state), the head streams of the Paraná, the Doce, and the Jequitinhonha. All the rivers have numerous cataracts and rapids; only the São Francisco is navigable for any distance, and it has no direct connection with the Atlantic Ocean. The climate, in general, is temperate, averaging 71.6° F. for the whole state. A great portion of the south and centre enjoys a much cooler climate, while the thickly wooded river valleys are very hot and humid. Originally the chief economic interest was centred in gold and diamond mines. These industries, in decline for a long period, have been revived and also the exploitation of mines of iron, of which there are large deposits, manganese, and precious stones has been undertaken. The chief industries are agriculture and stock raising, the leading agricultural products being coffee, corn, beans, rice, potatoes, tobacco, cotton, and sugar cane. Stock raising is carried on extensively, and butter and cheese are produced in large quantities. The chief manufactures are those of cotton, textiles, and cigars. The railway lines traversing the southern part of the state have a mileage of 2700 miles. Minas Geraes had a population of 3,184,099 in 1890, 3,594,471 in 1900; 4,500,000 (est.) in 1911. The inhabitants are largely of mixed origin, and the number of aborigines is still considerable; negroes are also numerous. Minas Geraes was settled at the end of the sixteenth century, immigrants being attracted there by the gold and diamond deposits. It was separated from the Captaincy General of Rio de Janeiro in 1709 and was made an independent captaincy in 1720. In 1788 it was the scene of an unsuccessful insurrection led by Joaquim José da Silva Xavier, "Tiradentes," which had

for its object independence and the establishment of a republic. Other revolts against the central government occurred in 1833, 1842, and 1844, all of which were suppressed. The capital was Ouro Preto (q.v.), up to 1897, when the seat of government was removed to Belo Horizonte or Minas (q.v.).

MINBU, min'boō. A district of the division of Magwe, Burma. Tillage and fishing are the chief industries. Area, 3302 square miles; pop., 1911, 263,939. Capital, Minbu.

MINCH. An arm of the Atlantic Ocean which separates the island of Lewes in the Hebrides from the northwest of Scotland (Map: Scotland, C 1). Its shores are exceedingly irregular and its average width is about 30 miles. It connects with the Gulf of the Hebrides to the south by the Little Minch, which is about 15 miles wide, and which separates the Isle of Skye from that of North Uist and the neighboring islands in the outer Hebrides.

MINCIO, mēn'chō. A left affluent of the River Po, Italy, which it joins near Governolo, 10 miles southeast of Mantua, after a southeasterly course of about 120 miles. Its source is at Pescheria, where it flows from Lake Garda. It is the ancient Mincius, and during the Austro-Italian wars (1800-14) was an important strategical base, several battles being fought along its banks.

MINCIUS. The ancient name for the river Mincio. This stream is celebrated by Vergil in his *Eclogues*.

MINCKWITZ, mīnk'vīts, JOHANNES (1812-85). A German poet and classical scholar, born at Lückersdorf. He was educated at Leipzig, was appointed professor there in 1861, and in 1883 removed to Heidelberg. He first gained fame by his translations into German of Homer, Æschylus, Sophocles, Euripides, Aristophanes, Pindar, and Lucian. He also wrote *Vorschule zum Homer* (1863). In the field of German criticism Minckwitz wrote *Platen als Mensch und Dichter* (1836) and *Leben Platens* (1838), and edited Platen's (q.v.) posthumous papers (1852); and he also published: *Lehrbuch der deutschen Verskunst* (1844); a play, *Der Prinzenraub* (1839); and a volume of popular poems (1847). Consult *Briefwechsel zwischen Platen und Minckwitz* (Leipzig, 1836).

MINCOPIES, min'kō-piz. The native inhabitants of the Andaman Islands. They are in general of very low stature, averaging 1.49 meters, and are subbrachycephalic with an index of 82.6. They have a very low grade of civilization, living in huts called chongs, which consist merely of a roof on four stakes, and going naked. They live by hunting and use a peculiar bow in the shape of an S, which presents a curious analogue to certain Eskimo bows and also to the bows of some Bantu tribes in East Africa. Linguistically it has been impossible to connect them with any other group, even among peoples of similar physical type. Consult: Man, "Aborigines of the Andaman Islands," in the *Journal of the Anthropological Institute*, vol. xi (London, 1882); Deniker, *Races of Man* (ib., 1901); A. R. Brown, "Notes on the Languages of the Andaman Islands," *Anthropos* (Salzburg, 1914). See ANDAMANS.

MIND (AS. *gemynd*, Icel. *minni*, Goth. *gamunds*, memory, from AS. *munan*, Icel. *muna*, Goth. *gamunan*, to remember; ultimately connected with Lat. *mens*, Gk. *μένος*, *menos*, mind, Skt. *man*, to think). The collective term for

the subject matter of psychology (q.v.). The common-sense view of mind makes it a mind substance, a spiritual agent, a real, simple, and unitary being, sharply opposed to material substance as "thought" is opposed to "extension," yet interacting with the physical universe under some form of the causal law. This conception of mind has its root in primitive reflection upon the phenomena of sleep, dreams, trance, and death, and upon certain types of behavior, especially, we may suppose, upon the behavior which expresses emotion. It received philosophical treatment at the hands of the scholastic psychologists, and, in its current form, is practically a legacy from Descartes. It is doubtless kept alive by its emotional value; it satisfies human aspirations and accords well with the natural anthropocentric notion of the world at large. It is still held by some psychologists: Ladd openly accepts it, and James, while rejecting it for his psychology, yet admits that, for his personal thinking, it appears "the line of least logical resistance." Nevertheless, such a view of mind is wholly foreign to the spirit and to the requirements of modern psychology. In the first place, it is unsupported by psychological evidence. Had there been the same emotional temptation to reject minds as there has been to posit them, we may be sure that the arguments ordinarily urged in their favor would have received but scant attention. Secondly, the assumption of a real mind is superfluous. "The substantialist view of the soul," says James, "is at all events needless for expressing the actual subjective phenomena of consciousness as they appear"; "the substantial soul explains nothing and guarantees nothing."

Numerous difficulties have been encountered, upon the metaphysical side, in the attempt to resolve the dualism of mind and body which is involved in this concept of the substantial mind. (See SUBSTANCE; SOUL; DUALISM; MONISM.) In consequence there arose, early in the history of psychology, a second view, according to which mind is not substance but active principle; mind is an activity. Aristotle, who first developed the theory, identified mind with the principle of life; mind is the regulative or formative principle of the biological process, and its relation to body is similar to that of form to matter. This view was also that of the neo-Scholastics (see AQUINAS, THOMAS); and, stripped of biological implications, it furnishes the initial basis of certain definitions of mind which may be found in present-day psychology. It is important, for the understanding of the theory, to distinguish between mind as an activity and the activity of mind. The substantial mind was early thought to be an active mind; feeling, perception, memory, imagination, etc., were all activities of the mind, and it was only through these activities that mind could be known. Furthermore, the attempt to subsume these activities under one or more principal activities or functions gave rise to what is called faculty psychology. (See FACULTY.) Aristotle's faculties, on the other hand, were not powers or activities of a mind; they were rather stages in the growth or development of mind; feeling is mind at a lower stage, thinking is mind at a higher stage. A third conception of mind became possible only when metaphysical discussion and logical classification gave way to scientific observation and description. Mind then came to be regarded (1) as

a form of experience or (2) as an aspect of experience. Those who adopt the first view characterize mental experience as that mode of experience which is directed towards an object; e.g., in idea something is ideated, in judgment something judged; and the mental phenomenon, therefore, is the *ideating* or the *judging*. But these are again mental acts; and so we find a return to the "activity" theory of Aristotle, with the difference that the act of seeing, hearing, judging, etc., is now held to be a form of direct experience. Those who adopt the second view deny that the phenomena of mind are a peculiar form of experience; they believe, on the contrary, that mind has to do with the whole world of experience, but only in so far as it is dependent upon an experiencing person. Even here, however, there are differences of opinion. If the experiencing person, otherwise undefined, is conceived as standing in some sort of relation to an object, then it is possible to reach a functional view of mind which in many respects is similar to the "activity" theory. But if the experiencing person is further defined as a physiological individual; if mental experience is regarded as that aspect of experience which is conditioned upon a nervous system, then the sights, the sounds, the warmth, the pains, etc., which we experience are themselves so many items of mind.

In so far, then, as the older theories of mind are concerned, modern psychology is what Lange, the historian of materialism, named it—a psychology without a mind, a *Psychologie ohne Seele*. Even the few writers who still cling to the substantialist view make no use of the assumption in their actual presentation of psychological facts and laws; it is only in their concluding remarks, at the point of transition from psychology proper to metaphysics, that mind, the "unit being," is introduced. At the same time it would be entirely erroneous to apply Lange's phrase, without qualification, to mental science. A psychology without some sort of mind would be impossible. The new psychology keeps the term "mind," but defines it, in functional or existential terms, as the sum total of an individual's mental experience. Just as a plant is a closed group of physiological functions, so is mind the collective name for the closed group of mental functions; or, just as the plant, again, is the organized whole of root, stem, leaves, and flowers, and not something above and behind these parts, so is mind the organized whole of our mental processes (q.v.), and not something above and behind these manifestations of mentality.

MINDANAO, mên'dá-ná'ô. One of the most important and, according to the latest official estimate, the second in size of the Philippine Islands. It is the southernmost of the large islands of the archipelago, between lat. 5° 21' and 9° 50' N. and between long. 121° 53' and 126° 28' E., about 220 miles northeast of Borneo and 270 miles north of Celebes (Map: Philippine Islands, D 7). It is bounded on the north by the channels and seas separating it from the islands of Leyte, Bohol, Cebú, and Negros, the narrowest of these channels being the Strait of Surigao, 7 miles wide, separating the northeast extremity of the island from Leyte. On the east Mindanao is bounded by the Pacific Ocean, on the south by the Celebes Sea, and on the west by the Sulu Sea.

Area and Configuration. The latest official estimate gives as the area of the mainland, 36,292 square miles, or 4677 square miles less than Luzon, and of the 264 dependent islands, 1165 square miles, making a total of 37,457, which, even excluding the dependent islands, is larger than that of the State of Indiana. Mindanao, like Luzon, is very irregular in outline, having a shore line of nearly 1600 miles in length. It consists of a main body about 300 miles long from north to south and 150 miles broad, with a long irregular peninsula stretching in a semicircle for 180 miles from the centre of the west coast, where it is connected by an isthmus between the Bay of Iligan on the north and the Bay of Illana on the south. There are numerous other large and small bays on all sides of the island, among which the large and deep Bay of Dávao indenting the south coast is one of the finest and largest of the archipelago. Of the dependent islands the principal (with their areas in square miles) are the following: Camiguín (94), off the north coast; Dinágat (309) and Siargao (151), on the northeast; Sámal (147), in the Bay of Dávao; Balut (42) and Sarangani (25), to the southeast; Olutanga (36), south of the western peninsula; and Basilan (478), forming with about 50 small islets a separate province at the extreme southwestern end.

Topography. The coasts as a rule consist of sandy beaches interrupted by numerous rocky headlands. Almost everywhere the forest-covered mountains approach close to the shores, and the interior is in general very mountainous, containing the highest peaks in the Philippines, such as Mount Malindang, 8560 feet high, in the northwestern part, and the volcano of Apo, 10,312 feet, west of Dávao Bay. The mountain system consists of a number of irregular, broken, and roughly parallel chains traversing the island from north to south and inclosing between them large and fertile valleys. The configuration of the mountains in many places bears evidence of having been influenced and even originated by volcanic action. There are several active and a number of extinct volcanoes, while plains of volcanic matter as well as sulphur and hot springs occur, and the island is subject to frequent and violent earthquakes. During the severe earthquake which visited the islands during 1897 the town of Zamboanga was ruined by the shaking and by a great sea wave. Very little is known concerning the geology of Mindanao. Like southern Luzon, volcanic rocks of modern date cover the island.

Hydrography. The two principal river systems lie on either side of the central mountain

range, both of them running almost the entire length of the island. On the east is the Augsan, over 200 miles long, running northward into the Bay of Butúan; on the west is the Río Grande de Mindoro, over 200 miles long and the second river in size on the archipelago, running south, then west into the Bay of Illana, and rivaling in size the Cagayán of Luzon. Both of these systems include several large lakes. Owing to the proximity of the mountains to the coasts most of the remaining rivers of Mindanao are short and torrential.

Climate. Being situated at the southern end of the archipelago, within 10 degrees of the equator, and being less exposed to cooling winds than the northern islands, Mindanao has a hot and humid climate. The warm and moisture-laden south winds are particularly enervating, though the land breezes from the mountains are cool and refreshing. The climate is more equable than that of Luzon and consequently less invigorating, and the island is seldom touched by the typhoons, which rage only among the northern islands. The rainfall is very heavy, often exceeding 100 inches and reaching sometimes 140 inches in a year. Several parts of the island are subject to destructive inundations.

Flora and Fauna (for general description see PHILIPPINES). The vegetation of Mindanao, even compared with the rest of the archipelago, is remarkably luxuriant. Almost the whole island is covered with forests so interwoven with canes and vines as to form in many places an impenetrable jungle. The flora partakes of the character of that of Celebes and the Moluccas; cinnamon, nutmeg, and other spices, and betel nuts grow wild, and the forests abound in the most valuable building timber and cabinet woods. The animal life is equally abundant and varied, including, besides the species common to all the islands, many species peculiar to Mindanao. Monkeys are very numerous, and especially characteristic is the white monkey (*Macacus philippinensis*). Reptiles, including venomous snakes, abound, and the rivers are infested with crocodiles.

The population as shown by the last census, 1903, was 499,634, an average of 14 per square mile. Of this population 252,940, or over one-half, were classed as "wild" or noncivilized. About one-third of the total are Christianized Malays, about one-half of the total are Moros (Mohammedan Malays), the remainder Chinese, "mestizos," and uncivilized tribes.

Agriculture and commerce have received little attention, although the agricultural possibilities are very great. Rice, sugar, coffee, hemp, corn, tobacco, and the betel nut are grown, and the quality and quantity both suggest great possibilities if properly managed. At present less than 2 per cent of the island is under cultivation, but there seems no reason why the island should not produce great quantities of sugar, hemp, rice, and copra. Cinnamon, nutmegs, and spices are found in the forests and would probably justify cultivation and care. The natives take no interest in agriculture in excess of that needed to meet their personal requirements. The forests produce valuable woods, but little has been done to find markets for them.

Combés, *Historia de Mindanao y Joló* (ib., 1897). See PHILIPPINE ISLANDS.

MIND AND BODY. See BODY AND MIND.

MIND CURE. See FAITH CURE; HYPNOTISM; MENTAL SCIENCE; MESMERISM; PSYCHOTHERAPEUTICS; SUGGESTION.

MINDEN. An ancient town in the Province of Westphalia, Prussia, on the left bank of the navigable Weser, 39 miles west of Hanover (Map: Prussia, C 2). It is an old-fashioned town, with narrow, winding streets, but the suburbs are modern. Its fortifications were demolished in 1873. Its public buildings include the thirteenth-century cathedral, a fine early Gothic structure with valuable works of art in its treasury; the town hall, the church of St. Martin, the government buildings, and the Gymnasium. Minden manufactures linen and cotton goods, dyestuffs, cigars, glassware, chemicals, chocolate, leather, lamps, cement, paper, chicory, and iron products. It also builds ships and repairs railway rolling stock. Charlemagne made Minden the seat of a bishopric, which was converted into a secular principality in 1648 and united with Brandenburg. Near Minden an Anglo-Prussian force under Ferdinand of Brunswick defeated a French army under Contades, Aug. 1, 1759. See SEVEN YEARS' WAR. Pop., 1900, 24,327; 1910, 26,454, chiefly Protestants.

MINDEN. A town and the parish seat of Webster Parish, La., 30 miles east-northeast of Shreveport, on the Louisiana and Arkansas Railroad (Map: Louisiana, C 1). Cotton, corn, sugar, and potatoes are raised extensively, and the chief industrial establishments are saw mills, cottonseed-oil mills, and compresses. The water works are owned by the town. Noteworthy attractions include the three parks and the splendid high-school building. Pop., 1900, 1561; 1910, 3002.

MINDONGA. See CHOBÍ.

MINDORO, mên-dô'rô. One of the Philippine Islands, among which it ranks seventh in size. It is situated south of the main body of Luzon, from which it is separated by a sea channel $7\frac{1}{2}$ miles wide (Map: Philippine Islands, C 4). Its extreme length from northwest to southeast is 100 miles, and its greatest width is 58 miles. The area of the mainland is 3851 and of the 26 dependent islands 173 square miles, making a total of 4024 square miles. The island has an oval shape with no large indentations, though there are a number of small bays and several almost landlocked harbors. The coasts, though generally having deep water close to shore, are lined, especially along the west side, with submarine reefs. Mindoro is, next to Mindanao, the most elevated of the Philippine Islands. The whole interior forms a mountainous plateau, reaching in Mount Halcón the height of 8800 feet. Almost the whole of the island, from the mountain summits to high-water mark, is covered with unbroken virgin forests, though in the narrow strip of lowland along the western coast there are some prairie and marshy regions. The rivers are all short and simple streams running down from the edge of the plateau on all sides, there being no large river system. The climate is more variable than that prevailing in the southern islands, and Mindoro is especially exposed to typhoons. The proximity of the forests to the coast towns renders these unhealthy and subject to intermittent and typhoid fevers. The yield of rice was at one time so great that the

island was called the "granary of the Philippines," but the industry was destroyed by Moro pirates.

In spite of the fertility and natural wealth of the island its economic conditions are in a very backward state. A very small portion of it is cultivated, and the yield of agricultural products is scarcely enough for home consumption. The cultivation of sugar, cotton, and hemp is increasing, and a little of the latter is exported. The mineral wealth is believed to be considerable, but only the coal beds and sulphur springs have begun to be exploited. The principal exports are forest products, such as timber and pitch, and the forests also are the basis of the principal industries—woodcutting and rattan splitting. Communication is almost exclusively carried on in coasting vessels, the interior being a rough and pathless wilderness.

The population of Mindoro in 1903 was 28,361, including 7264 savages. The inhabitants are chiefly Tagalogs, who number 18,185, with 7266 Mangyans, 2088 Visayans, and 630 Ilocanos. The inland of Mindoro, together with its dependent islands, forms the Province of Mindoro, which had in 1903 a population of 39,582. The most important tribes were represented as follows: Tagalogs, 26,408; Mangyans, 7268; Visayans, 4962. See PHILIPPINE ISLANDS.

MIND READING. See MUSCLE READING; TELEPATHY.

MIND-STUFF THEORY. A metaphysical theory which explains the relation of matter and mind by affirming their identity under the form of atoms of mind stuff. These atoms are of a nature between physical atoms and psychical monads, representing an indivisible element, as the former, but being qualitatively rather than quantitatively determined, as the latter. Mind and matter, according to this theory, are but forms of composition of the atoms of mind stuff; only under the most rarely favorable conditions does this composition result in intelligence, as in the higher animals, but at the same time no matter is to be conceived as "dead" matter, since it is built up of elements whose essential character is psychical. Mind stuff seen from the inside constitutes what we call mind; seen from the outside it is what is called matter. The theory is expounded by W. K. Clifford in *Mind*, O. S., vol. iii.

MINE. See MINING.

MINE, SUBMARINE. Formerly all explosive devices designed to destroy or injure a ship by blowing a hole in her hull below the water line were called torpedoes. They were divided into two classes, fixed and moving. The fixed class are now called *submarine mines*. Reference should be made to article **TORPEDO** for the history of submarine mines. Submarine mines are (1) self-acting and (2) controlled, according to the conditions of firing. Self-acting or contact mines are mechanically or electrically fired. The mechanical arrangements are of numerous types, but the most common have pins or levers which are on the exterior of the case. When struck by a passing vessel the pressure, or a spring released by the lever, drives a firing pin against a fulminate primer in contact with the charge. The electrically fired are (1) simple buoyant mines anchored, like all buoyant mines, so as to be held 5 to 20 feet below the surface, and (2) combination ground mines with a buoyant contact held at a similar depth. In both these types the explosion is caused by the

completion of the circuit by driving in a pin, depressing a lever, or the operation of some other device, when the mine or contact piece is struck by a ship. Electrically fired mines usually have separate battery boxes connected by a long double conductor wire to the mine. The battery box is thrown over when the mine is launched and lies on the bottom near the anchor.

Controlled mines are (1) automatic and (2) observation. The firing wires for all controlled mines lead to mine stations. For automatic mines this is done to secure safety. When the circuit is broken at the station the channel is safe for the passage of ships, but when it is closed the mine will explode if struck. The combination controlled mine, like the combination self-acting, is a ground mine with a buoyant contact piece; it is made ready in the same manner as an automatic controlled mine. Observation mines are fired by the observers. These are placed in stations so located that their lines of sight at the mine field intersect at angles of 45° or more. Each group of mines has a corresponding contact that is passed over by the sight bar on each observer's switchboard when the sight is directed to the centre of the group. When both contacts of a group are made the mines of the group are fired; this will of course occur when a ship is directly over the group. Observation mines may be of the simple or compound buoyant type or of the ground type. The simple buoyant mine can be exploded only by the observers; the compound type has pins and levers for explosion by contact so that it may be considered as belonging also to the *automatic buoyant controlled type*. Observation ground mines are simple if fitted for explosion by the observers only, and are combination if they also have contact pieces. Drifting mines are always self-acting, and most of them are mechanically fired.

In the accompanying figures many minor details are omitted for the sake of clearness.

FIG. 1.

Figure 1 is a self-acting, mechanically fired mine, operated by the lever b; a, a, are the halves of the mine case; c, a detent which holds

the lever in position until struck; *d*, the transporting lug; *e*, the anchor rope. A similar mine, fitted with an electric primer and switch in place of the percussion primer and firing pin, and with electric wires connecting it to an observing station, would be an automatic controlled mine; if fitted with wires and a battery instead of connected to a station it would be a self-acting, electrically fired mine. Observation mines have a similar appearance except as regards the lever, which is omitted. Figure 2

FIG. 2.

is a self-acting, mechanically fired mine, operated by the driving in of one of the pins *k*; *l* is the shell or mine case; *m*, the transporting lug; *n*, lug for the anchor rope; *k*, *k*, *k*, *k*, firing pins. Figure 3 is one of the many types

FIG. 3.

of mine anchors; *A* is the cast-iron body; *B*, the distance weight; *C*, the distance rope; *D*, the reel carrying the anchor rope *e*; *E*, pawl to control the operation of the reel *D*; *F*, reel axle; *G*, square head of reel axle to take wrench for reeling in. Figure 4 shows the operation of

anchoring. The depth of water is assumed to be about 40 feet; the mine to be held at 10 feet below the surface. *a*, *b*, *c*, show the position of the mine in the three stages of the process. *A* is the anchor; *B*, the distance weight; *R*, the distance rope; *S*, the anchor rope. Both ropes are of soft, pliable wire. The length of the distance rope is adjusted to the submerged

FIG. 4.

distance of the mine, 10 feet. Distance weight, anchor, and mine are dropped from the mine planter when over the selected position. The distance weight (usually of lead or with a lead filling) sinks rapidly until the distance rope is fully extended; the anchor does not sink with the same speed, being of less dense material and having a cavity which has to fill with water slowly. As long as the weight of *B* hangs on the clutch *E* (Fig. 3) the reel *D* is free to turn and unreel the anchor rope, but as soon as *B* reaches the bottom the reel is locked. The weight of the anchor then drags the mine the required distance below the surface.

Mines of all the types mentioned are in common use, their various characteristics fitting them to different local conditions. Self-acting mines have the advantage of (1) being comparatively cheap, (2) can be kept in store ready for immediate use, (3) do not require specially trained men or observation mining stations, and (4) extempore mines can be easily made. But self-acting mines are all (1) rather dangerous to put out or pick up, (2) the condition of the ignition apparatus cannot be tested after the mine is placed in position, (3) they are as dangerous to friend as to foe when once placed, and (4) the contact pins and levers, for mechanical or electrical firing, may become so oxidized, rusted, or overgrown with barnacles or seaweed as to prevent their operation; this condition is quickly reached in the tropics. After being two months in the water the Spanish self-acting torpedoes (in 1898) were so overgrown with barnacles that none was in a condition to explode if struck by a ship; indeed, the United States ships struck them without causing explosion, and one mine was drawn into the propeller and hit repeated hard blows. The objections to this type are evidently such as to preclude their use in important channels where controlled mines can be placed.

Ground mines are only suitable for shallow channels. In deep water buoyant mines must always be used. They are anchored with a submergence of 5 to 20 feet below the surface and at distances apart sufficient to prevent being set off by shock from the explosion of others. For

mines filled with guncotton the extreme destructive range (according to Gen. H. L. Abbott, U. S. A.) is 14.7 feet for a 100-pound charge, 20.5 feet for a 200-pound charge, and 31.7 for a 500-pound charge. The safety interval between mines or groups should be at least eight times the extreme destructive horizontal range. Mines are now commonly filled with trinitrotoluol, which is more destructive than guncotton, but the safety range is believed to be about the same. The necessity for separating mine groups by two or three hundred feet leaves a wide interval through which a ship might pass.* For this reason, and to insure her destruction in case some of the mines should fail to act, mines and mine groups are laid in several lines across the channel, the units of each line opposite the intervals in the adjacent ones. Self-acting mines are usually anchored separately, controlled mines in groups. Self-acting contact mines are frequently anchored in pairs with a line between them. If a vessel strikes the line she draws both mines alongside and explodes them.

The removal of mines is effected by sweeping or countermining. Sweeping or dragging may be effected in various ways, but is most expeditiously performed by two vessels. These steam abreast each other, a few hundred feet apart, dragging a stout wire rope, each having an end on board and the bight sliding along the bottom behind them. When one or more mines are gathered in the bight of the rope they are exploded by gunfire or a detonating charge. The operation of sweeping for mines is manifestly very dangerous unless the draft of the vessel engaged is shallow enough to pass over a mine field without hitting the mines. In the Great War of 1914 steam trawlers were much used by the British for this work, while various devices were employed in the Dardanelles, where much destruction was caused by the Turkish mines. Countermining is the explosion of mines by similar devices called countermines. Countermining is useful in clearing a narrow channel through a mine field. The countermines are laid in two or three rows along the channel to be cleared and close enough together to insure the explosion of any mines lying between them.

Modern submarine mines contain from 200 to 1000 pounds of guncotton or trinitrotoluol. Judging from the destructive force of mines in the European War a large proportion of the German mines had 500 pounds or more of explosive. When such a mine is exploded in contact with the bottom or side of a ship the result is instant destruction of the adjacent part of the hull and the sinking of the ship in a very few minutes.

The submarine mine played a very important part in this great war. It is a well-established rule of international law (q.v.) that no belligerent nation has any control of the high seas, which include all waters more than 3 miles from the coast of any nation. Notwithstanding this, the Germans strewed contact mines over a great part of the North Sea and across the ordinary trade routes. The British followed by mining another considerable area, though they defined the limits of their mines and notified neutral powers. The Germans later defined safe routes past their mines. Whether drifting mines were put out was not known. If not, then many anchored mines broke adrift. The number of neutral vessels and lives destroyed by mines

when pursuing presumably safe routes was large. In the first part of the war, up to Dec. 18, 1914, 8 Swedish vessels were sunk with a loss of life between 50 and 60; 6 Danish vessels with 6 lives; 5 Norwegian vessels with 6 lives; and 3 Netherland vessels with 15 lives. As mines are weapons of defense, the naval force acting on the offensive usually suffers most from their operation. In the last Russo-Japan War Japan lost two battleships, the Russians one. In the European War, up to March 20, 1915, the British lost by mines 3 battleships, 1 armored cruiser, 5 cruisers, 4 gunboats and torpedo vessels, 3 submarines, and 4 auxiliaries; the French, 1 battleship; the Japanese, 1 cruiser and 2 torpedo boats; the Germans, 1 armored cruiser; the Austrians, 1 cruiser and 2 torpedo boats; and the Turks, 1 gunboat.

MINE ACCIDENTS, PREVENTION OF. Mining from its nature is one of the most hazardous occupations, but the extent and degree of the dangers depend in large measure upon the precautions taken. The nature of the hazard is shown by the statement that, in 1913, 1,047,000 men were employed in coal and metal mines, and in quarries in the United States, and of this number 3651 were killed, which is at the rate of 3.49 per 1000 men employed. In 1912 the rate was 3.22 and, in 1911, 3.58. Such figures and those in the accompanying tables

DEATH RATES IN MINING VARIOUS MINERALS, UNITED STATES *

KIND OF MINES	Rate per 1000 men employed	
	1912	1913

properly may be studied with a graphical comparison of the death rates of coal mining in the United States and in European coal-mining countries from 1895 to 1913. This indicates that the United States death rate has been much higher in recent years than those of the other countries and shows the need of greater care in American mining.

Lessening Accidents in Metal Mines. Investigations indicate that the majority of mining accidents are caused by carelessness of one of the victims, although in many instances they are due to forgetfulness or absent-mindedness. One of the remedies is constantly to set before the miners such reminders, warnings, and safeguards that they will be led to take greater care.

Taking up the classification of accidents in the table herewith it will be observed that the largest number from any one cause in metal

mines is due to falls of rock from the hanging wall, or overhanging ore. A lessening of the number of such accidents can be obtained by careful inspection of the walls, barring or picking down the loose boulders, and by systematic timbering. Great improvement has been effected in some mines by employment of special inspectors, but it is inevitable that there will be some accidents from falls, though they can be materially lessened by proper care. Then, in the case of the use of explosives in metal

gether, all are prolific sources of accident. Haulage accidents are due to men being squeezed between the car and the side of the passage, to electrocution by touching the trolley wire, to the running away of a car, or a trip on a grade. These are all preventable by the use of proper safeguards.

Accidents classified "by falling" are from men falling down shafts, winzes, or steep stopes. Obviously the remedy is better ladders and landing places and the protection of edges of open areas by fences, gates, and other guards. Skip or cage accidents are generally due to bad design or arrangement, or defective workmanship, or to using worn-out or defective ropes for hoisting. Such accidents should be of the rarest occurrence. Generally speaking, greater care and more intelligent planning will eliminate many accidents classed as miscellaneous as well as those classified here.

Lessening Accidents in Coal Mining. It will be observed that by far the largest number of accidents from any one cause is from falls of roof, being about 40 per cent of the whole, and if falls from the face or pillar coal be included it makes nearly one-half of the total. Such accidents cannot be entirely prevented, but the number may be very greatly lessened by picking and barring down loose roof or coal; by systematic timbering, which consists in placing posts or timber sets at fixed intervals rather than haphazard (although the cost is greater);

CHART SHOWING FATALITIES IN MINING OPERATION.

mines, accidents from this source are due almost entirely to carelessness, forgetfulness, or improper methods. Premature firing, drilling into old charges, thawing out of frozen explosives, carelessness in handling these, dangerous magazines, and placing detonators and explosives to-

better methods of testing roof, which is by the sense of touch rather than by sound, i.e., when the roof is struck with a bar or hammer, if it is loose it will vibrate, whereas whenever a large rock is struck it is difficult to judge by the sound whether the rock is loose or not. Closer

2. Reinforced concrete stopping in experimental mine, Bruceton, Pa., broken by an explosion.

and better supervision of timbering at the face is of great advantage; this is obtained by the employment of district or face bosses, so that every place can be visited several times a day. In some mines an improper system of mining is employed, which increases the hazard of dangerous falls. Excessive charges of explosive shatter

gas, chiefly methane (CH_4), is found in nearly all coal mines except those at comparatively shallow depths. Ordinarily the gas is diluted and carried away by an air current, but if the mine-ventilation arrangements are poor, accumulations of fire damp may occur, and if one of these is ignited by a flame or a spark an

* Compiled by A. H. Fay, United States Bureau of Mines.

the roof. As large charges are employed in shooting off the solid, it is of great advantage to undercut the coal either by hand or machine, thus requiring the use of smaller charges of explosive.

Accidents by haulage are due to runaway trips and cars, to catching men between the car and the side of entry, and to electrocution from touching the trolley wire. The increased use of manways, or nonhaulage roads, serves to prevent haulage accidents, as do also providing greater clearance allowance on one side of haulage ways, the placing of shelter holes at regular intervals, the guarding of trolley and feed wires by sideboards, equipping cars with better brakes, and in dipping places the careful blocking of cars. The formation of systematic rules in regard to haulage and signaling and their enforced observance will reduce the number of accidents from this cause.

Accidents from Use of Explosives other than Explosions. Practically all explosive accidents result from careless handling and distribution of explosives. The making up of cartridges of black powder with an open light on the miner's cap, careless handling of detonators, and drilling into old charges are a few of the most prolific causes. To these may be added the improper storage of explosives underground, i.e., failure to put in boxes by themselves; the detonators should always be stored separately and apart from the explosive proper.

Fire-Damp and Coal-Dust Explosions. Although the total number of deaths due to inflammation of fire damp and explosions for any one year have always been less than those due to falls of roof material, nevertheless, since individual accidents of this nature often cause the deaths of large numbers, public attention is focused by the horror of such disasters. Special attention therefore has been paid in all coal-mining countries to the investigations of explosions with the view to their prevention. There have been a great many explosions in which from 100 to 400 men have been killed at a time. The greatest explosion that ever occurred with respect to the number killed was at Courrières, France, in 1906, when 1099 men were killed.

Cause of Fire-Damp Explosions.—Inflammable

explosion may result. Explosions of fire damp are caused usually by open lights, but they may be produced by the flame of explosives and sparks or arcs from electric machinery.

Prevention of Fire-Damp Explosions.—To prevent gas explosions it is necessary, first, to cause, by means of fans, the circulation of

permissible* explosives instead of black powder and dynamite; and fourth, the use of explosion-proof motors* or the withdrawal of electric equipment from the gaseous sections of the mine.

* Officially tested by United States Bureau of Mines and approved as comparatively safe for use in gaseous and dusty mines.

Causes of Coal-Dust Explosions.—Coal dust in a pile or layer is not explosive, but when it is raised into the air in a dense cloud and is then ignited it will explode violently. Two things are therefore necessary to originate a coal-dust explosion—a means of making a dust cloud and a means of igniting it. Both conditions may be caused by a single agency, such as a blown-out shot (i.e., blast) or a small gas explosion. A blown-out shot is so called when the energy of the powder is not used in breaking the coal but blows the stemming or tamping out of the drill hole. After the first cloud of dust is ignited the pressure of the explosion may form clouds beyond, which in turn will be ignited, and the process continues, so that the explosion advances with increasing strength as long as there is fuel available.

Prevention and Stopping of Coal-Dust Explosions.—Plans for prevention comprise decreasing the amount of coal dust made in mining operations, preventing cloud formation by wetting the dust or making it noninflammable by increasing the incombustible content of the dust clouds, eliminating means of ignition by use of safety lamps and permissible explosives, and, finally, confining explosions to small areas by "barriers." The accumulation of coal dust on roads can be greatly decreased by the use of tight cars, so that the fine coal dust cannot fall out, and by loading cars only to the top of sideboards, so that the coal will not be jarred off in transit.

Wet methods of rendering coal dust inert comprise saturating the air current by steam or sprays so that it will not dry out the mine dust, and sprinkling by sprays from water cars or by pipe lines and hose. Calcium chloride and other less deliquescent salts are sometimes used on the roads to keep the road dust wet. Coal dust to be nonexplosive must be wet enough to ball in the hand.

Dry methods of preventing coal-dust explosions comprise covering all surfaces with fine incombustible rock dust artificially ground; then, if the dust is blown up into a cloud, the cloud will contain so much incombustible matter that it cannot explode, the rock dust, if that is used, absorbing heat and separating the coal-dust particles. This method has the advantage over the use of water that the latter evaporates rapidly unless the air current is nearly saturated, while the rock-dust protection remains good for long periods.

As open lights and blow-out shots of long-flame explosives are the most common igniting means of starting explosions, the replacement of them by safety and electric lamps and permissible explosives has greatly decreased the possibility of explosions occurring.

J. Taffanel, a French investigator, developed the first barrier or concentration of rock dust for stopping explosions, in case they start through failure of initial preventive means. It consisted of 10 to 15 boards placed across the mine passages just beneath the roof and loaded with rock dust. If an explosion occurred the dust was blown or upset from the shelves and quenched the flame, thus preventing the passage of the explosion to points beyond. These barriers operated successfully except in rare cases when the explosion was a slow-moving one. To take care of such cases and to protect the rock dust from wetting where wetting methods were employed, closed rock-dust barriers were de-

signed by George S. Rice, chief mining engineer of the Bureau of Mines, and tested at the Bruce-ton Experimental Mine of the United States Bureau of Mines, successfully extinguishing explosions and meeting the conditions above mentioned. The accompanying illustration shows one type, the "Concentrated Rock Dust Barrier," after extinguishing a very light explosion. It will be noted that the bottom boards have dropped, allowing the dust to sift down. In a violent explosion the whole barrier is smashed and three tons of rock dust immediately launched into the blast.

Rescue Work. Before the discovery of rescue apparatus and the development of modern methods of mine recovery rescue parties sometimes rushed into a mine after an explosion and lost their lives by suffocation from afterdamp, or by igniting gas with open lights and causing secondary explosions. In modern methods exploration is made in advance of bratticing parties by trained rescue crews equipped with the self-contained oxygen breathing apparatus, safety and electric lamps, and canaries. Such exploration hastens the discovery of any who may still be alive and insures the absence of mine fires before the restoration of the air current. The breathing apparatus is so attached to the wearer that he breathes no air or gases

CIRCULATING SYSTEM OF ONE TYPE OF RESCUE APPARATUS WITH MOUTH-BREATHING DEVICE.

from without the apparatus. It furnishes him with air having a high percentage of oxygen and constantly removes the carbon dioxide from the air exhaled by the wearer. The accompanying diagram shows the air circulation of the apparatus.

Safety lamps (q.v.) are carried by the crews to test for inflammable gas and black damp, the latter term being applied to mixtures of carbon dioxide and nitrogen. Portable electric lamps give a strong light, which is necessary for exploration work and, not using oxygen like the safety lamps, furnish illumination in any atmosphere. The actions of the canary indicate the absence or presence of small percentages of carbon monoxide (atmospheres containing only 0.25 per cent are dangerous to breathe), to which it is much more sensitive than small animals and human beings, so that if the canary is not overcome it is safe to permit men without apparatus to advance.

Many thousands of men have now been trained in the use of rescue apparatus and in rendering first aid to the injured by the United States Bureau of Mines, the State rescue stations of

Illinois, and by instructors of private stations maintained by mining companies. There are, therefore, crews in every mining district who are competent to assist in rescue work in time of disaster and alert at other times to do all in their power to prevent accidents or to furnish first aid in case of accident.

Schmerber, *La sécurité dans les mines* (Paris, 1910), containing a bibliography; J. H. Dague, *Mine Accidents and their Prevention* (Scranton, 1912); also reports, technical bulletins, and miners' circulars of the United States Bureau of Mines, available upon application or through the Government Printing Office, Washington; also official reports of Pennsylvania, Illinois, and other States.

MINE GAS. Many coal mines contain gas of an explosive nature. The most common of these is marsh gas, CH_4 , which is very explosive if mixed with the right proportions of air. This mixture is known to miners as fire damp. Other gases found in coal mines and which may be dangerous in one way or another are carbonic-acid gas, CO_2 (called black damp or choke damp), and carbon monoxide, CO (white damp). Afterdamp is a gas present after an explosion of gas in the mine and is very dangerous. On account of mine gases, miners often have to use safety lamps for illumination, these lamps being so constructed that the flame does not come in contact with the air and gas in the mine workings. The danger of explosion is also minimized by thorough ventilation. Consult bulletins issued by United States Bureau of Mines. See COAL; SAFETY LAMP.

MINEO, mè-nā'ô. A town in the Province of Catania, Sicily, 27 miles southwest of Catania. It occupies the site of the ancient Menæ, founded by Ducetius, 459 B.C., and captured by the Saracens in 840. The ancient walls and castle are still in evidence. In the vicinity is the famous Lago de' Palici, the Lacus Palicorum, of volcanic origin with mineral springs. Pop. (commune), 1901, 9828; 1911, 8728.*

MINER, ALONZO AMES (1814-95). An American Universalist minister, born at Lempster, N. H. He was educated in the public schools and after teaching for several years was ordained to the Universalist ministry in 1839 and served as pastor in Methuen, Lowell, and Boston, Mass. He was president of, and professor of ethics and political economy in, Tufts College from 1862 to 1875, when he returned to his former pastorate of the Second Universalist Church, Boston. He was appointed a member of the board of overseers of Harvard University in 1863; served 24 years (1869-93) as a member of the State Board of Education and as chairman of the board of visitors to the State Normal Art School (Boston) from 1873; was for 21 years president of the Massachusetts State Temperance Alliance; and stood as Prohibition candidate for Governor in 1878. He was the original projector of the Universalist Publishing House in Boston and became prominent in the antislavery agitation. He edited *The Star of Bethlehem*, contributed to periodicals, and published: *Bible Exercises* (1854); *Old Forts Taken* (1878); *Doctrines of Universalism*. His *Life* was published by G. H. Emerson (Boston, 1896).

MINER, CHARLES (1780-1865). An Ameri-

can journalist, born at Norwich, Conn. At 19 he removed with his family to the Wyoming valley in Pennsylvania, where he became interested in various newspapers, writing under the pen name of John Harwood. He was a member of Congress from Pennsylvania in 1825-29 and was the first to bring to the official notice of that body the possibilities of silk culture and manufacture in the United States. He returned to the Wyoming valley in 1832. The most important of his publications is a *History of Wyoming* (1845), which contains a description of the Wyoming massacre given by eyewitnesses.

MINER, THOMAS (1777-1841). An American physician, born at Middletown, Conn. After graduating from Yale in 1796, he then taught school and studied law, but turned to medicine and established himself in practice at Lynn, Mass. He was one of the founders of the Yale Medical School and was president of the Connecticut State Medical Society from 1834 to 1837. He is the author of *Essays upon Fevers and Other Medical Subjects* (1823), with Dr. William Tally, and *Typhus Syncopalis . . . or the Spotted Fever, etc.* (1825).

MINERAL ACID, IN MEDICINE. An acid not of animal or vegetable origin. The mineral acids most generally used in medicine are sulphuric (oil of vitriol), nitric (aqua fortis), hydrochloric (muriatic), nitrohydrochloric, and phosphoric. In their medicinal action they have many properties in common.

The strong acids are escharotic, abstracting the waters of the tissues, combining with the albumin and other bases, and destroying the protoplasm. They are very diffusible. Sulphuric and phosphoric acid have a strong affinity for water, completely decomposing tissues to which they are applied; they are therefore powerfully escharotic. Sulphuric acid makes a black eschar, while nitric and hydrochloric acid turn the tissues yellow. They are all astringent to the tissues, hydrochloric being the weakest and sulphuric the strongest in this respect.

These acids diluted produce a peculiar metallic taste in the mouth and a sensation of roughness on the teeth. They stimulate the flow of saliva from the parotid and submaxillary glands. They promote the alkaline secretions of the intestines and of glandular organs (bile, etc.), but check the secretions of acid fluids, as the gastric juice. Given before meals, in small doses, they relieve undue acidity of the stomach by checking the production of the acid gastric juice. At first they aid digestion, being helpful to the action of pepsin; combined with stomachics they are useful in dyspepsia with deficiency of the gastric juice. If continued too long they may impair digestion by lessening the production of the gastric juice. They check fermentation and constipate the bowels, except nitric acid, which relaxes them.

Antidotes for poisoning by these acids are: alkalis, such as bicarbonate of soda, lime water; or in an emergency plaster from a wall may be mixed with water to neutralize the acid; oil, albumin, and milk to protect the mucous membranes. For stimulants, opium and ammonia (intravenously) may be used to counteract the resulting depression of the vital powers. See ANTIDOTE.

All these mineral acids, if well diluted, are classed as refrigerants and are useful in fevers, especially in typhoid. Hydrochloric is here preferable. Nitric is the acid generally preferred

as a caustic, its action being effectual and superficial; it may be applied undiluted to phagedenic ulcers and sloughs, warty growths, and indolent sores. Sulphuric acid, dilute, is appropriate in cases of diarrhoea, colliquative sweating, and as a prophylactic against lead poisoning; it is used also as an acid drink in fevers and before meals in acidity of the stomach. Phosphoric acid is considered of special value in tissue waste and in dissolving phosphatic deposits. All these acids act injuriously on the teeth by attacking the enamel. They should always be administered largely diluted, taken through a straw or glass tube, and the mouth should be thoroughly rinsed at once with an alkaline wash. See NITRIC ACID; HYDROCHLORIC ACID.

MINERAL COLORS. A term applied to a number of inorganic substances used in the manufacture of paints. The principal mineral colors include the following: *white lead*, consisting chiefly of basic lead carbonate; *zinc white*, or oxide of zinc; *antimony white*, or oxide of antimony; *fixed white* (*blanc fixe*), artificial or natural barytes, barium sulphate; *mineral white*, or calcium sulphate; *china clay*, or aluminium silicate; *whiting*, or calcium carbonate; native or artificial *yellow ochres*, i.e., earths colored by iron oxide; *litharge*, *massicot*, or oxide of lead; *strontian yellow*, or chromate of strontium; the chromates of cadmium, mercury, and barium; *mineral yellow*, or oxychloride of lead; *Naples yellow*, or antimonate of lead; *orpiment*, or sulphide of arsenic; *rouge*, Venetian and Indian reds or red oxides of iron; *vermilion* and *cinnabar*, or sulphide of mercury; *Derby red*, or basic chromate of lead; *minium*, or orange mineral (red lead), or lead orthoplumbates; *realgar*, or red sulphide of arsenic; *Brunswick green*, or oxychloride of copper; *Scheele's green*, or copper arsenite; *Schweinfurt green*, a mixture of copper acetate and Scheele's green; *cobalt green*, or cobalt and zinc oxide; *umber*, or brown silicate of iron and manganese; native or artificial *brown ochres*, i.e., earths colored by iron oxide; *Berlin blue*, or ferrocyanide of iron; *Thénard's blue*, or aluminate of cobalt; *ultramarine blue*, a compound of aluminium, sodium, silicon, oxygen, and sulphur; etc. The principal mineral colors are described in special articles or in connection with the metals or acids combined in them. See also PAINTS; PAINTERS' COLORS.

MINERAL DEPOSITS. See ORE DEPOSITS; and the articles on the different ores and minerals.

MINERALOGY (by haplology for **mineralology*, from *mineral*, OF. *mineral*, Fr. *minéral*, from ML. *mineralis*, ore, from *minera*, *mineria*, *minaria*, mine, from *minerarius*, pertaining to mines, from *minare*, to mine, lead here and there, Lat. to drive, from *minari*, to threaten, from *minæ*, threats, from *minere*, to jut out + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The science of those natural substances known as minerals which, together or separately, form the material of the earth's crust and also, as far as our knowledge extends, that of other celestial bodies. A mineral is a substance of definite chemical composition which has been directly produced by the processes of inorganic nature. It must be homogeneous even when submitted to minute microscopic examination and must possess a definite composition capable of being expressed by a chemical formula. Laboratory and

furnace products, or such substances as shells and bones of animals, cannot be included in the range of mineralogy. It is the function of the mineralogist to investigate the form, properties, and composition of minerals, their genesis, their relations to one another and to the accompanying rocks, the places where they are found, and the geological conditions under which they are formed. A knowledge of mineralogy is of importance to the geologist in his study of the rock formations, to the mining engineer in his search for metal-producing minerals, and to the metallurgist in the extraction of metals from minerals. Many of the useful arts are directly dependent for their raw materials upon minerals, while some mineral species occur in such brilliancy and beauty of color as to be highly prized as gems.

The Branches of Mineralogy. The general subject of mineralogy may be divided into four sections: 1. *Crystallography*, which includes the description of crystals, their character, classification, the mathematical relations of their faces, and the methods of expressing them graphically and symbolically. (See CRYSTALLOGRAPHY.) 2. *Physical mineralogy*, which describes the physical characters of minerals and deals with the properties related to their molecular structure. 3. *Chemical mineralogy*, which has for its object the determination of the chemical composition of each mineral species and the relation in composition between species in the same chemical group. 4. *Descriptive mineralogy*, which includes the detailed description of each mineral species with respect to its form, structure, physical properties, chemical composition, and geographical and geological occurrence. The division of physical mineralogy is replete with interesting problems of cohesion, optics, heat, and electricity, and suggests to the investigator along physical lines many fields for research. The problems connected with chemical mineralogy, while covering a narrower and less varied field than those of physical mineralogy, are none the less replete with interest. To the chemist working in the field of mineralogy belongs the task of determining the part played by the various elements which enter into the composition of the hundreds of mineral species, many of which are rare and exceedingly complex in composition; the phenomena of isomorphism and dimorphism; and the chemical alteration of mineral species under the action of natural agencies, which is known as pseudomorphism.

Crystallography. With very few exceptions (mercury and water) minerals are limited to solid substances; i.e., they are solid at the present temperature of the earth. In discussing their formation and character we must, however, revert to the period when the mineral constituents of the earth existed in a fluid or semi-fluid state. When a homogeneous substance passes from a fluid to a solid condition, its particles mutually attract each other along certain definite lines and a solid is built up which shows a definite structural relation between all its integral parts, which relation finds expression in its outward form. Such a solid, formed from a nucleus by the piling up of accretions from without, is known as a crystal and is characterized by a regular polyhedral form, bounded by more or less smooth surfaces. A crystal is, then, the normal form of a mineral which has solidified under ideal conditions and, should its formation be uninterrupted by external agencies, its ap-

1. Normal crystal form developed equally in all directions.
2. Same crystal form as 1, distorted.
3. Crystal molecule showing an arrangement of attractive and repellent forces.

4. Network of molecules formed on the lines of crystallizing forces shown in 3.
5. Further development of network shown in 4 to explain cleavage.
6. Twin crystal formed by two interpenetrated cubes.

pearance would be that of a symmetrical geometric solid with smooth faces and sharp edges and angles. Such are the ideal representations, which serve to illustrate the crystallization of mineral species and which are to be found in all textbooks on the subject. But inasmuch as the ideal conditions mentioned above are of comparatively rare occurrence, it is far more common to find minerals in more or less distorted forms. (See Figs. 1 and 2.) Large and well-formed crystals are, in general, produced by a slow process of crystallization, whereas a rapid cooling or concentration of a mineralizing solution tends to form aggregates often resembling the forms of animate nature; such are the frost patterns which form on windowpanes, the coral-like forms of calcium carbonate to be found in some caves, and many other imitative forms described in the terminology of mineralogy. Where individual crystals are entirely lacking, the mineral is said to be massive, although its structure as determined by optical and other methods may be distinctly crystalline.

Regarding the nature of the crystalline units of accretion, there is at present very little knowledge. They are without doubt extremely minute and may possibly consist of a number of chemical molecules. Whatever may be the size or shape of the crystal units or crystal molecules, it is sufficient for the purpose of discussion to regard them as points. A fuller discussion of this subject will be found under CHEMISTRY. The crystal molecules of any chemical substance crystallizing under given conditions are believed to be identical in size and shape. They are never in contact with each other, but are held in equilibrium by attractive and repellent forces acting along lines which differ for each type of crystal molecule. A crystal molecule having these lines of crystallizing force at right angles, as shown in Fig. 3, would attract like molecules, which would arrange themselves as shown in Fig. 4. The theoretical grouping of molecules has been discussed by Sohncke, Fedorow, Schönflies, and Barlow, who have developed 230 possible groupings. These, however, divide themselves into 32 distinct groups identical with the 32 groups mentioned under CRYSTALLOGRAPHY.

If we assume the molecules of a substance to be grouped as shown in Fig. 5, it will be readily seen that the lines of minimum cohesion will be *aa* and *bb* rather than *mm*, because the former planes are further separated from the next adjacent parallel plane. This explains in a measure the fact that crystallized substances often tend to break or cleave parallel to a primary crystallographic face. Assuming a crystal molecule of any given mineral to be held in equilibrium by forces acting in definite directions, it will be readily seen that the crystal built up from accretions of such molecules will, of necessity, present faces which are symmetrically disposed with respect to those lines of crystallizing force. Thus, we have as a fundamental law of crystallization the principle that a mineral can crystallize only in forms whose symmetry is referable to one of the 32 groups mentioned in the foregoing paragraph. This is known as the law of symmetry. The number of planes possible from the grouping together of crystal molecules of a substance is invariably greater than the number occurring on any given crystal, and modifying planes are common, often running to great complexity and under unusual

conditions predominating over the commoner types. Hence we frequently find great variety of form in crystals of the same substance, as is the case with the mineral calcite (q.v.). It should, however, be noted that crystals of a mineral from a certain locality, which are presumably formed under the same conditions, show a marked similarity of type and are readily distinguishable from those of the same mineral from a different locality. This variation in type, which is known as crystal habit, is particularly noticeable in large and widely distributed species. Certain mineral species exhibit a tendency to join two crystals or two halves of the same crystal in such a manner that some crystallographic plane or axis is common to both. This juxtaposition, which is ordinarily distinguished by reëntering angles, is known as twinning. (See Fig. 6.)

It will be readily seen from the above that an accurate knowledge of the occurring crystal forms is of primary importance in the investigation of any mineral species. The identification of the faces of the crystal, which is often attended with considerable difficulty, is accomplished by measuring the interfacial angles by means of an instrument called a goniometer (q.v.) and comparing these with the calculated relations obtained from simple mathematical formulas based on spherical trigonometry. The optical properties of minerals as well as their presence and relations in rocks are determined by means of the petrographic microscope. (See MICROSCOPE.) For exhaustive study along the line of physical characters, elaborate and accurate apparatus is required, while a well-equipped chemical laboratory is almost indispensable to the mineralogical investigator.

Minerals and Rocks. One of the most important phases of mineralogical study, and one which is replete with interest to the geologist, is the relation of minerals to rocks. The division known as the crystalline rocks, in particular, presents a wide and varied series of rock-forming minerals. These may be classed as essential and accessory constituents according as they give character in the rock in which they occur or are present only in insignificant proportions. Quartz, the feldspars, the micas, hornblende, augite, enstatite, hypersthene, chrysolite, garnet, leucite, serpentine, calcite, and dolomite are essential constituents of many crystalline rocks, while such minerals as gypsum, salt, limonite, hematite, siderite, kaolin, magnetite, and apatite often occur in such extensive deposits as to constitute rock masses. Among the accessory rock-forming minerals may be mentioned graphite, corundum, vesuvianite, chialstolite, cyanite, tourmaline, zircon, titanite, etc. Many geologists have made use of the mineralogical character of rocks as a basis of classification, particularly in the case of the igneous rocks, and, though open to some objection from the standpoint of geological inquiry, the system as applied to crystalline rocks has much to commend it.

Mineral Chemistry. Comparatively few elements exist in nature uncombined; the great majority of minerals occur as salts of relatively few mineral acids. Minerals crystallizing from a mineralizing fluid, whether it be a solution or a fusion, combine the elements existing in that fluid in strict accordance with the laws of chemistry. The resulting minerals may, however, be somewhat modified by the presence of elements foreign to their typical formulas, as in the case

of the emerald variety of beryl, which owes its brilliant green color to the presence of a small amount of chromium not represented in the normal composition of beryl. Again, certain elements closely related in chemical character frequently replace one another in mineral composition, the relative proportions varying between limits and giving rise to a group of closely related compounds. Such is the columbite-tantalite group, which presents all the gradations from normal columbite (FeNb_2O_6) to normal tantalite (FeTa_2O_6). Minerals closely related in composition often exhibit a striking similarity in crystal form. When such isomorphous compounds are present in the same magma they are not separable in the process of crystallization, but tend to produce a mineral intermediate in composition, as when the isomorphous carbonates dolomite and siderite grade into the intermediate compound ankerite. An extremely interesting group is that of the triclinic feldspars or plagioclases, which are regarded as isomorphous mixtures of the molecules of the two isomorphous species albite and anorthite. Mineralogy affords several examples of mineral species identical in chemical composition, but crystallizing in forms which are essentially different. This condition, which is known as dimorphism, is represented by the two calcium carbonates calcite and aragonite and by the two iron disulphides pyrite and marcasite. Titanium dioxide, which is trimorphous, occurs as rutile, octahedrite, and brookite.

Classification of Minerals. The most logical and convenient scheme of classification of minerals is that which is adopted by Dana in his *System of Mineralogy* and which is now, with slight modifications, universally used. By this method mineral species of similar composition are placed together in classes which are subdivided into divisions. These in turn are split up as far as possible into isomorphous groups. The principal classes are:

1. Native elements.
2. Sulphides—sulphides, selenides, tellurides, arsenides, and antimonides.
3. Sulpho salts—sulpharsenides, sulphantimonides, and sulphobismuthites.
4. Haloids—chlorides, bromides, iodides, and fluorides.
5. Oxides.
6. Oxygen salts—carbonates, silicates, and titanates; niobates and tantalates; phosphates, etc.; borates and uranates; sulphates, etc.; tungstates, molybdates.
7. Salts of the organic acids.
8. Hydrocarbons.

Uses of Minerals. By far the most important of the uses to which minerals are put is that of producing metals from those of them which contain metal constituents in sufficient quantity to render their mining profitable. The discussion of the distribution and mode of occurrence of metallic ores involves many questions of a purely technical nature and belongs essentially to the province of ore deposits (q.v.). A few metals such as gold, platinum, copper, arsenic, and to some extent silver, antimony, bismuth, and mercury, are found native, i.e., uncombined with other elements. The majority of the metallic ores, however, occur as sulphides, oxides, or carbonates of the various metals, or more rarely as arsenides, tellurides, chlorides, or silicates. Association of metallic minerals in more or less intimate mixtures often gives rise

to highly complex ores. Many ores which are essentially compounds of the base metals contain gold and silver in appreciable amounts and are profitably mined for the latter metals, as is the case with the argentiferous galena of Colorado, Montana, and Utah.

The nonmetallic minerals, although of less importance commercially than the metallic ores, are none the less of great and increasing value in the arts. These are grouped, with reference to their application, into: 1. Substances used for chemical purposes, embracing the minerals employed in the manufacture of acids, chemicals, soda, alum, plaster of Paris, etc. 2. Ceramic materials, used in making pottery, bricks, tiling, paving blocks, terra cotta, porcelain, and glass. 3. Refractory materials, used in the manufacture of fireproofing, linings of furnaces, crucibles, and asbestos fabrics. 4. Abrasives, embracing diamonds, emery, garnet, and quartz sand. 5. Graphitic materials, embracing chalk, graphite, pencil stone, lithographic limestone, etc. 6. Pigments, including minerals ground for paints, and paint adulterants. 7. Fertilizers, represented by the lime phosphates, marls, and land plaster. 8. Mineral fuels, including coal, petroleum, and natural gas. The use of certain minerals for gems is probably of very ancient origin. The extreme hardness of the diamond, sapphire, ruby, emerald, chrysoberyl, and other precious stones protects them from injury and renders them capable of being highly polished.

Synthetic Mineralogy. Almost all of the important minerals have been successfully produced artificially, and much light has been thrown upon the formation of natural minerals in this way. The methods applied to this line of research involve in the majority of cases a fusion at a high heat for a long period. In a number of instances artificial minerals have been accidentally produced in the course of various metallurgical operations, and the interiors of retorts and furnaces often furnish interesting examples of this phase of mineral genesis. In point of economic importance these experiments, though interesting, have not as yet achieved a marked degree of success in the production of gems, except in the case of the corundum gems, which are now manufactured and sold as synthetic sapphires.

Analysis of Minerals. The determination of minerals is largely a question of experience gained by the study of large and varied collections of specimens. The eye becomes trained by practice to recognize crystallizations even in distorted and imperfectly exposed forms, to associate certain colors, lustre, and structure with definite species, and to associate certain minerals with certain rock matrix. Several physical properties are of considerable aid in identifying questionable specimens, as, e.g., the color of the powdered mineral as shown by rubbing it on unglazed porcelain, the approximate relative hardness as determined by scratching the specimen with a knife point, and the relative weight as roughly determined by weighing the specimen in the hand. These rough determinations, which are of particular value as field methods, may be supplemented, with the addition of some simple and portable apparatus, by determinations of solubility and fusibility. A more detailed examination of the composition of a mineral involves recourse to the blowpipe analysis. Blowpipe analysis, as it is at present

practiced, consists of a quantitative chemical analysis on a small scale. For this purpose very small portions of the substance to be examined are used, and most of the chemical reactions involved are effected by means of some form of blowpipe (q.v.). Formerly the methods of blowpipe analysis were extended and elaborated to include quantitative determinations, but the smallness of the samples which could be successfully treated rendered the results of quantitative blowpipe analysis inexact, even when practiced by a skilled and experienced manipulator, and this branch has now been abandoned in favor of the more reliable methods of quantitative analysis (q.v.). Some idea of the results obtained by blowpipe analysis will be gained by an examination of the accompanying plate, which shows the reactions obtained from some of the fusible metals by heating their compounds with suitable fluxes on charcoal and plaster supports. The coatings of iodides are produced by using a flux composed of two parts sulphur and one part each of potassium bisulphate and potassic iodide. Reactions for iron, copper, manganese, nickel, cobalt, chromium, and other metals are obtained by dissolving small portions of their compounds in hot beads of borax or microcosmic salt and subjecting the resulting fusion to the oxidizing and reducing action of the blowpipe flame. The color imparted to the blowpipe flame serves as a test for compounds of calcium, strontium, lithium, barium, sodium, and other elements. These tests as well as others of similar nature merely announce the presence or absence of an element; the relative amount when required must be determined by a systematic quantitative analysis.

History. Although a few mineral species were known to philosophers at an early date in the world's history, it was not until the development of chemistry from alchemy in the sixteenth century that savants approached the subject of mineralogical knowledge in the true spirit of scientific investigation. As a natural outcome of the comparatively advanced state of mathematical knowledge at the period of this scientific awakening, the subject of crystallization early developed a marked importance. In 1783 Delisle, with the aid of a primitive form of goniometer, measured the interfacial angles of a number of crystals and established the law of constancy of interfacial angles. The Abbé Haüy about the same time developed a theory correlating the internal structure of crystals with their outward form. He practically formulated the law of rational indices which constitutes the corner stone of crystallography. Haüy was followed by Hausmann with his application of spherical trigonometry in 1803, Weiss with a development along purely mathematical lines in 1814, Mohs with a division of crystals into six systems in 1822, Naumann in 1823, and W. H. Miller in 1839. In recent years the science has made vast strides, and new methods and lines of research are being constantly developed. Our knowledge of the science of mineralogy is constantly enriched by the discovery of new species, while mining and quarrying operations are continually bringing to light new and interesting crystalline forms and varieties of well-known minerals.

Research in physical mineralogy is being extended, notably in Germany, along a number of lines, and from time to time valuable additions

are made to our store of knowledge by careful and exhaustive studies of the optical, thermal, and electrical properties of certain mineral species. A method by which the symmetry of crystallized minerals may be investigated has been developed by Baumhauer, Beck, and others. This method depends upon the development of minute angular cavities upon crystal faces by means of the interrupted action of some dissolving medium. The symmetry of these pits, which are known as etch figures, conforms to the crystallographic symmetry of the mineral experimented upon. Of a similar nature in their bearing upon the question of crystal structure are the percussion figures and solution planes which have been made objects of special study by several authors.

The artificial formation of minerals opens another line of research upon which much valuable work has been done by Daubrée, Fouqué, Michel Lévy, Friedel, Bourgeois, Meunier, and others.

Bibliography. Among valuable works on general mineralogy may be mentioned: Des Cloizeaux, *Manuel de minéralogie*, with atlas (Paris, vol. i, 1862; vol. ii, part i, 1874); Hillary Bauerman, *Text-Book of Descriptive Mineralogy* (London, 1884); Tschermak, *Lehrbuch der Mineralogie* (Vienna, 1885); Hintze, *Handbuch der Mineralogie* (Leipzig, vol. ii, 1897; vol. i, 1902-04); the invaluable *International Catalogue of Scientific Literature: Mineralogy* (London, 1901 et seq.); E. S. Dana, *Text-Book of Mineralogy* (new enlarged ed., New York, 1910); J. D. Dana, *System of Mineralogy* (6th ed., with Appendices 1, 2, ib., 1911). Of a rather more elementary nature, but of considerable value to the student of mineralogy are: E. S. Dana, *Minerals and How to Study Them* (2d rev. ed., New York, 1897); Moses and Parsons, *Mineralogy, Crystallography, and Blowpipe Analysis* (4th ed., ib., 1909); Phillips, *Mineralogy* (ib., 1912).

In addition to the above the following works are especially devoted to crystallography and physical mineralogy: Mallard, *Traité de cristallographie géométrique et physique* (Paris, vol. i, 1879; vol. ii, 1884); Liebisch, *Geometrische Krystallographie* (Leipzig, 1881); Story-Maskelyne, *Crystallography: The Morphology of Crystals* (London, 1895); G. H. Williams, *Elements of Crystallography* (New York, 1891); Groth, *Physikalische Krystallographie* (Leipzig, 1894-95); A. J. Moses, *Character of Crystals* (New York, 1899); Hillary Hilton, *Mathematical Crystallography* (Oxford, 1903).

Valuable textbooks on determinative mineralogy are: Endlich, *Manual of Qualitative Blowpipe Analysis* (New York, 1892); G. J. Brush, *Manual of Determinative Mineralogy* (16th ed., ib., 1903).

Of value in the study of minerals in rock sections are: Rosenbusch, *Mikroskopische Physiographie der petrographisch wichtigen Mineralien* (Stuttgart, 1873; 3d ed., 1892; trans. and abridged by Iddings, New York, 1888); L. M. Luquer, *Minerals in Rock Sections* (3d ed., New York, 1908).

The following works are useful for reference on subjects connected with economic mineralogy: F. P. Dewey, *Preliminary Descriptive Catalogue of the Systematic Collections in Economic Geology and Metallurgy in the United States National Museum*, Bulletin 42, United States National Museum (Washington, 1891); J. A. Roush,

The Mineral Industry (New York, annually, 1892 et seq.); G. P. Merrill, *The Non-Metallic Minerals: Their Occurrence and Uses* (2d ed., ib., 1910).

In addition to these the reader is referred to the volumes on *Mineral Resources of the United States*, published by the United States Geological Survey (Washington, 1882 et seq.).

MINERAL PAINT. See PAINT, MINERAL.

MINERAL POINT. A city in Iowa Co., Wis., 50 miles west of Madison, the State capital, on the Chicago, Milwaukee, and St. Paul and the Mineral Point and Northern railroads (Map: Wisconsin, C 6). It contains an attractive high-school building, a public library, and a municipal auditorium. The chief industry is the manufacture of oxide of zinc, lead and zinc both being found in the vicinity. The water works are owned by the city. Pop., 1900, 2991; 1910, 2925.

MINERAL TALLOW, or HATCHETTITE. A yellowish-white, soft, flexible mineral wax or tallow that melts at 46° or 47° C. and consists of about 86 per cent of carbon and 14 per cent of hydrogen. It is found in the coal measures in Glamorganshire, Wales; Argyleshire, Scotland; and Moravia, Austria. See OZOCERITE.

MINERAL WATERS. The term usually applied to spring or well waters which have a variable quantity of solid substances in solution, and on this account may exert effects on the human body different from those of ordinary water. Mineral waters have been used as remedial agents from a very early period. The oldest Greek physicians had great faith in their curative power, and the temples erected to Æsculapius were usually close to mineral springs. We are indebted to the Romans for the discovery not only of the thermal springs in Italy, but also of some of the most important springs in other parts of Europe, as those of Aix-la-Chapelle, Baden-Baden, Bath, and Spa in Belgium. In the United States mineral springs have also attracted attention since an early period. At Saratoga Springs, e.g., the High Rock Spring was known to the white people as early as 1767, and the American aborigines seem to have been acquainted with its important properties even before that date. In West Virginia and Virginia seven springs were already noted in 1831, and of these the Bath mineral spring, now known as the Berkeley Spring, was visited as early as 1777, while the White Sulphur Springs were utilized in 1778. The therapeutic action of mineral waters or spas, as they are frequently termed, depends largely on their chemical composition and their temperature, although a variety of other circumstances, such as situation, elevation, climate, mean temperature and, above all, the regular habits of the patient, have no doubt an important bearing on the success of the treatment.

Origin. The origin of mineral waters is often looked upon with much curiosity, and yet there is nothing unnatural about it. The rain water falling on the surface soaks down through the soil into the rocks and may slowly filter through them to a considerable depth, coming out to the surface at a lower level in the form of a spring; or again the water may reach sufficient depths to be subjected to great pressure or even heat, and coming to a fissure or being struck by an artesian-well boring, it will tend to escape to the surface through such an outlet. Many mineral springs are found along lines of faulting,

since fault fissures afford a means of escape. The dissolved mineral substances no doubt are obtained from the rocks through which the water has flowed. In some cases the waters in seeping through one type of rock may take up certain acids which later react on basic elements contained in other rocks, thus producing salts. Most waters contain some carbonic acid, which greatly increases their solvent powers in the presence of lime, magnesia, and iron; while, if the waters are alkaline, they may take up substances which are ordinarily rather insoluble, such as silica. The attacking power of the water may be still further increased if it is hot. There seems to be some relation between hot springs and the geological structure of a region, as thermal springs are more abundant in areas where the rocks have been highly faulted or where there has been volcanic activity in comparatively recent geological times. Mineral springs commonly contain more dissolved material in regions of sedimentary rock formation than in igneous or metamorphic areas.

Temperature. Springs are commonly characterized as thermal when they have a temperature of over 70° F. If the temperature is between 70° and 98°, they are called tepid, while all exceeding the latter limit are included under hot springs. The following examples will serve to show the degrees of temperature found in different thermal springs: Sweet Springs, W. Va., 74° F.; Warm Springs, French Broad River, Tenn., 95°; Washita, Ark., 140°–156°; San Bernardino Hot Springs, Cal., 108°–172°; Las Vegas, N. Mex., 110°–140°; Sulphur Springs, Aix-les-Bains, France, 108°; Kaiserquelle, Aix-la-Chapelle, Prussia, 131°; Karlsbad (Sprudel), Bohemia, 162°.

Flow of Springs. The amount of water which a mineral spring may discharge is quite variable; thus, 500 springs in central France, which were tested, yielded 2,628,000 gallons in 24 hours, and the famous Orange Spring in Florida is said to discharge 5,000,000 gallons per hour. The discharge per hour of some of the principal American springs is as follows: Champion Springs, Saratoga, 2500 gallons; Roanoke Red Sulphur Springs, Va., 1278 gallons; Warm Sulphur Springs, Bath, Va., 350,000 gallons; Hot Springs, Ark., 20,100 gallons; Glen Springs, Waukesha, Wis., 45,000 gallons; Horeb, Waukesha, Wis., 1500 gallons.

Classification. A classification of mineral waters may be geographic, geologic, therapeutic, or chemical. The following scheme of classification is one adopted by A. C. Peale, a noted authority on the subject of mineral waters, and more especially those of the United States:

CLASSIFICATION OF MINERAL WATERS

Alkaline		{ Sodie Lithic Potassic Calcic Magnesic Chalybeate Aluminous	{ Nongaseous Carbonated Sulphureted Azotized Carbureted
Alkaline-saline	{ Sulphated Muriated		
Saline	{ Sulphated Muriated		
Acid	{ Sulphated Muriated Siliceous	{ Sulphated Muriated	

The *alkaline* waters include all those containing alkaline carbonates, such as carbonates of

alkalies, alkaline earths, alkaline metals, or iron. About one-half of the alkaline springs of the United States are calcic alkaline, i.e., containing calcium carbonates or bicarbonates as the predominant ingredient. The water of the Hot Springs of Virginia is a hot, carbonated, calcic alkaline water. The *alkaline-saline* waters include those containing combinations of alkaline carbonates with sulphides (sulphated) or chlorides (muriated), there being in the United States one-third as many as of the saline waters. In the *saline* waters sulphides and chlorides predominate; in the United States there are about one-third more springs of this class than of the alkaline springs. Springs which are classified as purgative or aperient will fall in the subclass of sulphated salines. The salines may be sodic sulphated or muriated, or calcic sulphated or muriated; the sodic muriated constitute about 88 per cent of the muriated saline waters of the United States. The *acid* class includes all waters containing free acid, whether silicic, sulphuric, or hydrochloric. In addition to having free acid a spring may also contain salts of the acid.

Geographical Distribution. There are at the present time probably not less than 10,000 mineral springs in the United States, and of this number 838 were listed as commercial producers in 1913. Most of the mineral springs of commercial value are found in the eastern United

waters are effectual in diseases of the liver, spleen, and skin, in neuralgia, and rheumatic and dyspeptic troubles. Farther south in the Appalachians are the celebrated Hot Springs of Virginia, including the Berkeley Springs and the White Sulphur Springs. The waters of the former are used chiefly for certain forms of dyspepsia, diseases of the liver and bowels, while those of the latter are of special value in the treatment of chronic diseases, gout, rheumatism, etc. The general character of the springs of Virginia and West Virginia is saline; sulphureted waters are the most numerous, but alkaline and chalybeate and acid springs also occur. The saline springs are found in excess of all others in the South Central States, and thermal springs are few. In this region the States of Kentucky, Tennessee, and Arkansas are the chief producers of mineral waters. The Hot Springs of Arkansas are among the most important thermal springs found in the entire country and are of value for diseases of the blood. The Texas springs are peculiar from the fact that many of them show free sulphuric acid. Owing to the abundance of limestone formations in the North Central States, calcic springs are quite numerous, and in Wisconsin those of Waukesha are widely known. In the Cordilleran region the most noted occurrence of hot springs is that of the Yellowstone Park, but they are not used for medicinal purposes. In New Mexico the Las

States and in the Mississippi valley; west of the 101st meridian they are largely confined to the Pacific coast. No hot springs are known in the New England States. In Maine the springs are slightly alkaline-saline and chalybeated, with a few of carbonic character. Their temperature ranges from 40° to 46° F. Chalybeated springs are abundant in Massachusetts. Many of the springs of the New England States are utilized for commercial purposes, but among the Eastern States as a whole New York stands at the head of the list of producers. The springs at Saratoga have an international reputation and compare favorably with any of the foreign spas; they attract great numbers of tourists and health seekers, and their waters are extensively used throughout the United States. These

Vegas Hot Springs are often visited, and in Washington the Medical Lake is the source of one of the best-known mineral waters of the Pacific coast.

Foreign Waters. A number of foreign mineral waters are imported into the United States and find a considerable sale. Chief among these is the Apollinaris water, which comes from Ahrweiler, Germany, and which is largely used as a table water and in cases of nervous irritation attended with dyspepsia. The Friedrichshall bitterwater, from the Friedrichshall Springs, near Hildenburg, Germany, is largely used for habitual constipation, as is the Hunyadi-János water from Budapest, Hungary, which is a remedy also for congestive and gouty disorders. The Kissingen waters from Bavaria, the Vichy

from France, and the Karlsbad Sprudel waters are extensively imported into the United States.

Production. The production of mineral waters in the United States in 1913 amounted to 57,867,399 gallons, valued at \$5,631,391. The imports in the same year amounted to 3,364,676 gallons, valued at \$955,788.

Chemical Analyses. The table on page 725 shows the important constituents of some of the American mineral waters.

Bibliography. Peale, "Lists and Analyses of the Mineral Springs of the United States," in *United States Geological Survey, Bulletin No. 32* (Washington, 1886); Branner, "Mineral Waters of Arkansas," in *Arkansas Geological Survey Report* (Little Rock, 1891); Schweitzer, "A Report on the Mineral Waters of Missouri," in *Missouri Geological Survey, vol. iii* (Jefferson City, 1892); Peale, "Natural Mineral Waters of the United States," in *United States Geological Survey, Nineteenth Annual Report* (Washington, 1898); Crook, *Mineral Waters of the United States and their Therapeutic Uses* (Philadelphia, 1899); De Launay, *Recherche, captage et aménagement des sources thermominérales, origine des eaux minérales, géologie, propriétés physiques et chimiques* (Paris, 1899); Bailey, "Mineral Waters of Kansas," in *Kansas Geological Survey, vol. vii* (Topeka, 1902); Kemp, "The Mineral Springs of Saratoga, N. Y.," in *New York State Museum, Bulletin 159* (1912). See BOTTLING AND BOTTLING MACHINERY.

MINERAL WELLS. A city in Palo Pinto Co., Tex., 55 miles by rail northwest of Fort Worth, on the Weatherford, Mineral Wells, and Northwestern and the Gulf, Texas, and Western railroads (Map: Texas, C 3). It is essentially a health resort, owing to its noted mineral wells, and attracts thousands of visitors annually. More than 1,000,000 gallons of the water are bottled and shipped from here every year, and the drinking pavilions of the city are said to be among the largest in the country. Places of interest in the vicinity are Lake Pinto, Elmhurst Park, and Lovers' Retreat, all of great scenic beauty. Mineral Wells adopted the commission form of government in 1913. Pop., 1900, 2048; 1910, 3950.

MINERS, WESTERN FEDERATION OF. A centralized association of persons working in and around mines, mills, and smelters. Its purposes are the general improvement in the conditions of labor and the abolition of such abuses as the truck system, child labor, the employment of private detectives, importation of labor under contract, government by injunction, etc. The officers of the association consist of a president, vice president, secretary treasurer, and an executive board composed of these officers and one organizer from each of the six districts into which the territory covered by the Federation is divided. The executive board acts as a board of conciliation and arbitration (which are strongly recommended by the Federation), may levy assessments in case of emergency, must approve every strike and joint contract entered into by local unions, and between the annual conventions has full power to direct the workings of the Federation. The Western Federation of Miners officially indorses Socialism and advocates participation of labor organizations in politics with

the view of securing to the working classes the ownership and operation of the means of production. It was founded May 15, 1893, largely as an outcome of the notorious Cœur d'Alène strike of 1892. In April, 1899, it again became involved in the Cœur d'Alène strike of that year, and in the later period of the strike controlled and directed it. During this conflict several persons were killed, martial law was declared, and certain county officers were impeached for failure to perform their duties in suppressing violence. A large number of miners were arrested by the temporary authorities and imprisoned in a stockade known as the bull pen. Persons desirous of securing work in the mines at that time were forced to obtain a permit, which was issued only after the applicant had signed a statement denying that he had participated in the riot of April 29, declaring his belief that it was incited and perpetrated by the miners' unions, expressing disapproval of the riot, renouncing membership in the miners' union, and pledging himself thereafter to obey the law. The Western Federation of Miners conducted in 1913 the Michigan copper strike, although the organization had gained no foothold there before the strike, and officially advised the copper miners against inaugurating a strike before establishing a solid organization. In 1913 there were 180 local unions affiliated with the Western Federation, with nearly 45,000 members. The unions were distributed through 22 States, chiefly in the Rocky Mountain and Pacific region and in Canada and Alaska. From 1896 to 1898 the organization was affiliated with the American Federation of Labor; from 1898 to 1905 with the American Labor Union; and in 1905 it took part in organizing the I. W. W., with which it remained connected until 1908. In 1911 it again became affiliated with the American Federation of Labor. The official organ is the *Miners' Magazine*, published monthly at Denver, Colo.

MINERS' ANÆMIA. See ANKYLOSTOMIASIS.

MINERS MILLS. A borough in Luzerne Co., Pa., about 3 miles northeast of Wilkes-Barre, on the Delaware and Hudson, the Central of New Jersey, and the Lehigh Valley railroads (Map: Pennsylvania, K 4). The surrounding region yields a fine grade of anthracite coal, and besides the mining interests, the town contains a flour mill, a brick plant, and ironworks. Pop., 1900, 2224; 1910, 3159.

MINERSVILLE. A borough in Schuylkill Co., Pa., 4 miles west of Pottsville, with which it is connected by an electric road, on the west branch of the Schuylkill River and on the Lehigh Valley, the Philadelphia and Reading, Pennsylvania, and the People's railroads (Map: Pennsylvania, J 6). It is in the anthracite coal region and has extensive coal-mining interests and underwear factories. Pop., 1900, 4815; 1910, 7240.

MINERVA (Old Lat. *Menerva*, from root seen in Lat. *mens*, *memini*, *moneo*, Skt. *man-*, Gk. *ménos*, *menos*, spirit, strength. Minerva is thus the Thinker. The name Athena, Gk. *Ἀθήνη*, has not been satisfactorily explained. *Παλλάς*, *Pallas*, at first an epithet of the goddess, but later used as a name, has been connected with *παλλακή*, *pallakē*, a maiden). A Roman goddess identified with the Greek Athena. Though the two divinities have some resemblance, it will be best to treat them separately.

Greek. Athena, called also Pallas Athena, or, simply, Pallas, was a universally worshiped Hellenic divinity, and there is no satisfactory evidence of a foreign origin for her cult. In the earliest literature we find Athena already a fully developed personality, the favorite daughter of Zeus, wielder at times of his ægis (q.v.), and but little inferior to him in power. In general the goddess was warlike. Hence she was worshiped in the citadel of many towns, and her sacred images, the Palladia, which were often said to have fallen from heaven, were kept with great care, for their possession made the town impregnable. (See PALLADIUM.) She is not, however, connected with the mere lust of battle, but with military wisdom and patient strategy as well as with heroic prowess in actual conflict. Wisdom is, in fact, so prominent in the conception that later she became the patron of learning. Even in early times she is Ergane, the Worker, the goddess of crafts, especially the feminine occupations of spinning and weaving. This conception of her may have arisen from the custom of weaving for the statue of the goddess a peplos or mantle. Athena was also the goddess of smiths, and even of agriculture, so that at Athens the smiths and potters celebrated the *Chalkeia* as a joint festival of Hephestus and Athena. As a battle goddess, she was worshiped at Athens as Athene Nike, bearing the spear and shield, and wearing the ægis, which is commonly adorned with the Gorgon's head, of petrifying power. As Ergane she carries the spindle; as Nike she carries a pomegranate. Sacred to her were also the snake and the owl, and especially the olive, which she was said to have given to Athens, her favorite city. In the Greek belief she was the pure virgin, but there are plain traces that this was not original.

Athens is for us the great centre of Athena worship, and here there were two ancient shrines, the Palladium in the lower town, the seat of an ancient court for the trial of involuntary homicide, and the Acropolis, where were the house of Erechtheus and the shrine of Athena Polias, Protectress of the City. Here was an ancient temple, burned by the Persians, but possibly rebuilt, at least in part. Close to its site was built, near the end of the fifth century, the somewhat complicated Erechtheum (q.v.), and earlier (437 B.C.) the Acropolis was crowned by the magnificent Parthenon (q.v.), containing the gold-ivory statue of the goddess by Phidias. In her honor were celebrated the Panathenæa (q.v.) and other smaller festivals, at some of which mystic rites were prominent. According to the common legend she was born from the head of Zeus, who produced her by his own power. Other versions told how Zeus had swallowed METIS (Wisdom) when pregnant by him of Athena. In the fullness of time Hephestus or Prometheus or Hermes, to relieve the pains in the head of Zeus, split it with an axe, whereupon the goddess leaped forth full-armed—a scene frequent in the earlier vases. The nature of Athena is still a matter of dispute. To Roscher (see below) there is much in favor of the view that she is a goddess of the lightning. Farnell rejects this view, and finds mental and moral rather than physical elements predominant in the cult of the goddess from the beginning; he regards her rather as the director of the intellectual life of mankind, in all its varied aspects, peaceful and warlike both.

Roman. Minerva seems to be an old Italian goddess, patroness of handicrafts of all sorts, whose worship was also common in Etruria. She was not originally one of the leading Roman divinities, for her name is absent from the oldest religious calendars. When her worship was introduced is not known, but it was certainly early, for Minerva is one of the Capitoline triad, and was worshiped with Jupiter and Juno in the great temple of Jupiter Capitolinus, built by Tarquinius Priscus (see CAPITOL). She had also an ancient temple on the Aventine, which was the religious centre for the guilds of craftsmen, whose patron the goddess was. The festival of this temple was celebrated on March 19, the fifth day after the Ides (whence the name of the festival, Quinquatrus, or Quinquatria), and seems to have formed originally part of a festival of Mars. In time Minerva herself became patroness too of the arts of war. This festival was chiefly celebrated by the guilds, including physicians (whence was worshiped a Minerva Medica), dramatic poets, and actors, and was of a distinctly popular character. (For Minerva as patroness of learning, see ATHENÆUM.) On the Capitol Minerva appears in her Greek aspect as protector of the city, but this and her worship as a goddess of battle or victory seem due entirely to foreign influence. In the later Republic and the Empire the Greek conception of Athena almost completely supplanted the earlier Italian belief. Thus the Palladium (q.v.) kept at Rome in the temple of Vesta was believed to be an image of Minerva. Consult: W. W. Fowler, *Roman Festivals* (London, 1899); G. Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911).

MINERVA MEDICA, TEMPLE OF. The name erroneously given in the seventeenth century to the ruins of a decagonal nymphaum on the Esquiline in Rome, formerly belonging to the Licinian Gardens, or, according to some authorities, to the Thermæ of Gallienus (c.250 A.D.). The name was wrongly based on that of the famous statue in the Vatican Museum miscalled Minerva Medica, which was not found on the Esquiline, but near the church of Santa Maria sopra Minerva. The 10 sides of the nymphaum, once adorned with mosaics and porphyry, are occupied on the lower story by a door and nine niches, with 10 windows above them. It was covered by a dome which was destroyed in 1828 and which was the earliest example of a dome above a drum of windows with buttresses between. When the ruins were excavated in the sixteenth century numbers of statues and architectural marbles were recovered.

MINERVA PRESS. The name of a London printing house, from which issued, late in the

eighteenth and early in the nineteenth century, an immense number of sentimental and trashy novels.

MINERVINO MURGE, me'nēr-vē'nō mōōr'já. A walled town in the Province of Bari delle Puglie, Italy, situated 25 miles southwest of Barletta (Map: Italy, F 4). It produces fruit, vegetables, and oil. There are also large quarries and limekilns. Pop., 1901, 17,353; 1911, 19,325.

MINES, BUREAU OF. A bureau of mining, metallurgy, and mineral technology in the Department of the Interior of the United States whose general function is to conduct, in the public interest, inquiries and scientific and technological investigations concerning mining, and the preparation, treatment, and utilization of mineral substances, with a view to improving health conditions and increasing safety, efficiency, economic development, and the conservation of natural resources, as well as to inquire into the economic conditions affecting these industries, and to disseminate general information having to do with mines and minerals. This bureau was established by Act of Congress, approved May 16, 1910, and became effective on July 1 the same year. The organic act establishing the bureau provided that the Secretary of the Interior should transfer to the Bureau of Mines from the United States Geological Survey the analyzing and testing of coals and other mineral fuel substances, and the investigations as to the cause of mine explosions. The various engineers, chemists, and other employees, also the equipment of the Geological Survey used for this work, were accordingly placed under the direction of the new bureau. It proceeded to carry on a number of important investigations having to do with such subjects as coal-mine explosions, explosives used in mining, especially those which, if properly used, will not ignite coal dust or coal dust and fire damp in small percentages; such explosives are tested and if they meet the rigid specifications are called "permissible" explosives for use in dusty and gaseous coal mines. Other investigations are: the use of electricity in mining, and the testing and approval of safety lamps, mine rescue, and first-aid apparatus. An important function of the bureau's work is the gathering of coal samples in mines and from shipments of coal for use by the navy, the army, the Panama Canal, and for the government buildings. The samples are analyzed, and larger shipments are tested in boiler plants and on vessels belonging to the government. Samples of coal gathered by geologists of the United States Geological Survey in their investigations are analyzed in the bureau's laboratory. The results of all coals sampled and analyzed are published from time to time in bulletins. The scope and purpose of the bureau were widened in a subsequent organic Act, approved Feb. 25, 1913, to include quarrying, metal mining, and metallurgical investigations and mineral fuels; and its work has since been conducted with vigor and valuable researches and publications have followed. The Bureau of Mines is under a director, Joseph A. Holmes, and includes, besides the administrative division, as organized in 1915, five technical divisions: mining, metallurgy, mineral technology, fuels (other than petroleum), and petroleum, including natural gas. The chief technical headquarters is at Pittsburgh, Pa., which is the largest coal-mining and steel-making centre. Extensive

testing is done here of mining appliances especially with reference to safety, and an experimental coal mine, chiefly for large explosion tests, is maintained by the bureau at Bruceton, 12 miles southwest of Pittsburgh. At this headquarters, chemical research as well as routine work is carried on. An analytical laboratory for testing fuels for government uses is maintained at Washington, D. C. A chemical laboratory is located at Denver for research work in connection with complex ores and rare metals like radium. Also in coöperation with a philanthropic institute, radium ores are concentrated and radium bromide produced for use in hospitals. At Salt Lake City, Utah, a coöperative laboratory is maintained for smelting and for electrometallurgical investigations. In San Francisco there are maintained laboratories for the investigation of smelter fumes and of methods of their prevention; also here, as well as in Pittsburgh, there are laboratories for petroleum and natural-gas investigations. These various investigations have already produced many valuable suggestions and results. Accounts, together with accident statistical information, have been published from time to time. Up to the end of the fiscal year 1914-'78 technical papers, 15 miner's circulars, and 82 bulletins had been published. Inspection of coal mines on government lands and in Oklahoma on "segregated" Indian lands, also in Alaska, is a function of the bureau. One of the most important parts of the bureau's work concerns the health and safety of workers in metallurgical and mineral concentration plants as well as in mines and quarries; however, as yet, in accordance with the terms of the appropriations, the chief safety and health investigations have been in coal mines. For the rescue of miners who may be entrapped by explosions or fires, mine-rescue corps under the leadership of district mining engineers have been maintained. While these men have assisted in many disasters, their chief function is to train miners in the use of oxygen-breathing apparatus and in first-aid methods. In its mine-rescue work and training work there are maintained mine safety cars equipped with apparatus for mine-rescue work and available to be sent to the scene of any mine accident but which normally travel in and around the principal mining districts, to give instruction to employees at each mine visited. In 1914 eight of such cars were in service, six in the principal coal fields, one in the Lake Superior iron and copper district, and one in the Rocky Mountain districts, while in Pittsburgh, Pa., and Birmingham, Ala., mine-rescue motor trucks able to transport nine rescue men with artificial breathing apparatus and first-aid supplies were available in case of disaster. The mine-rescue work of the bureau is done in coöperation with State officials and with mine operators. In addition to the cars and rescue trucks the bureau maintains six mine safety stations located respectively at Pittsburgh, Pa., Knoxville, Tenn., Birmingham, Ala., Urbana, Ill., McAlester, Okla., and Seattle, Wash., primarily for the purpose of training and instructing miners sent to these stations by operators or who come of their own initiative. Much suffering has been saved through the organization of first-aid crews. See MINE ACCIDENTS.

MINES AND MINING, IN LAW. The law relating to mines in the United States has been almost wholly developed within the last 65

years, or since the opening of the gold fields of California in 1849-50. By the common law of England all mines of gold or silver, wherever found, belong not to the owner of the land, but to the sovereign as an incident of the royal prerogative. There is some doubt as to whether this doctrine was ever generally adopted in the United States. It was, however, undoubtedly recognized by several Eastern States immediately after the Revolution, and in New York a statute, still in force, expressly reserves to the State the right to mines of gold and silver. In general, however, the government of the United States was considered to reserve all mineral rights in public lands conveyed or given to citizens, unless such rights were expressly granted. For a time the government leased mineral lands on royalties or fixed rents, but, owing to the great difficulty of ascertaining and collecting the amounts due, this policy was finally abandoned, and rights to take minerals were granted outright.

The law was in this condition when gold was discovered in California, and thousands of persons, many of them without previous experience in mining and with no knowledge of mining rights, rushed there and discovered and opened up mines. To avoid the frequent shedding of blood and other disagreeable consequences of disputes over the extent of each other's rights, it became the custom for the miners in a new district to meet and pass rules and regulations defining the rights of discoverers and miners, and these were enforced by committees appointed for the purpose. Subsequently, when courts were established in California, they adopted these rules and regulations, which had become so recognized and fixed in mining communities as to become in effect their common law. The claims of the miners were protected on the fiction that they had originally obtained a license from the government, and if they followed the rules of their particular districts they were held to have a property right in their mines, or claims, as they were called. These rights or claims could be conveyed, would descend to the heirs of the holder, and were in every way treated as real property. In July, 1866, Congress passed a law providing that title to public mineral lands might be acquired by payment of a small fee and by complying with certain prescribed formalities. This Act was superseded by the Act of 1873 (Rev. Stat., Tit. xxxii, c. 6), which substantially incorporated the provisions of the former Act and supplemented them with others suggested by the new development in mining practice, and which is the basis of the present mining law.

The Act of 1873 also provided for the judicial recognition of the rules and regulations then prevalent, and such as might thereafter obtain recognition in mining districts, where they were not contrary to its own provisions or the laws of the States in which such districts were situated. One of the important provisions of the last Act was to prescribe the maximum limits of claims. The extent of a lode claim, i.e., one where the ore runs in a well-defined vein, is fixed at 300 feet on either side of the vein by 1500 feet in length; and placer claims, i.e., where the ore is loosely mingled with the surface earth, are not to exceed 20 acres to one individual, or 160 acres to an association of individuals. The areas of both lode and placer claims may be changed by the statutes of the States in which they are

situated or by the rules of the mining district, provided they do not exceed the above-defined limits. The owner of a claim may follow a well-defined vein of mineral for 3000 feet from the opening of the shaft in any direction, and he may follow a vein the general course of which is downward through its "dips" and variations indefinitely.

The common-law rule that a man owns everything directly beneath the surface of his land is, therefore, not followed in the modern law relating to mines. It often happens that two lodes intersect, and in such a case the one who first opened his mine is entitled to the ore at the point of intersection; but each is entitled to follow his lode farther, and each has an easement or right to cross the tunnel of the other at that point in the proper working of his mine. Owing to the great difficulty in ascertaining whether a person in following his own vein is or is not trespassing on another's lode, any owner of lands who has reasonable cause to believe that another is doing so may obtain from a court of equity an "order of inspection" to determine whether the latter is encroaching on the land of the complainant or not.

Rights to water, which is so essential in mining operations, vary in different jurisdictions; but in general the one who first appropriates the waters of a stream for his use in mining is conceded the right to use all that is reasonably necessary in his operations. However, when some one else locates on the same stream the first person can continue to take only the amount he was using when the second person located his claim. The owner of a mine must properly support the earth surrounding his tunnels, and is liable for any damage caused to the lands of others by settling of the earth if due to his negligence in this respect. The rules and customs of the miners which were given the effect of law by the Statute of 1873, and those which have since come into existence, are too numerous and complicated to be set forth in the scope of this article. However, it may be said that in the present state of the law the courts, in deciding a case involving mining law, take into consideration, in the order mentioned, the statutes of the United States, the laws of the State in which the property in question is situated, and the rules and customs above referred to.

Any citizen of the United States, or a person who has declared his intention to become such, may locate and obtain a patent for a mining claim on public lands. Before a person can acquire any rights he must have actually discovered the presence of minerals. The first step thereafter is to make a "location" on the land claimed, i.e., to perform certain acts which are deemed to constitute sufficient evidence of an intention to claim the benefits of the discovery. The United States statutes provide that a claim must be "distinctly marked on the ground so that its boundaries can be readily traced." This is usually done by setting up boundary monuments, such as posts or stones, at the four corners of the claim. In most States the locator, as the prospector is called, is required to post a written notice of his claim on some object on the land. This notice consists of a description of the land thus appropriated and a declaration of his intention to occupy it for mining purposes. Such notice of claim must also be filed with a recording officer, usually the register of deeds of the county. After a miner has located his claim

in the above manner he must continue his mining operations or he will be deemed to have forfeited it. The labor may consist in actual mining, or in improvements in the mine for preservation or increased convenience in working it. When a claim is forfeited by a failure to perform labor of the required value it is open to relocation by any one. However, under this statute the claim is not forfeited until the expiration of a year from the time operations ceased. A claim may also be lost by abandonment, which consists in leaving a claim with an intention not to return and work it again.

Where a mining prospector complies with all the formalities required by law to obtain a location he has a good title against every one except the United States. In order to complete his title and make it a matter of record, the locator may obtain a patent, i.e., a grant, of the claim from the Federal government, by having a

MINES AND MINING, MILITARY. The term "military mining" is used in two senses. The first covers the placing and explosion of charges of explosive underground with a view to destroying men, matériel, and communications. It includes the ordinary use of mines as one of the obstacles to the approach of an attacking force. The other and more specific use of the term is to denote one of the stages in a stub-

MINING OPERATIONS AT GRAUDENZ, 1862.

survey and an abstract of his possessory title made and filing them in the United States Land Office, together with a formal application for a patent and a certificate to the effect that he has expended at least \$500 on the claim, either in improving or working it. The application consists of an affidavit to the effect that he has complied with all local mining customs and regulations as well as the statutory requirements to obtain a good possessory title. One copy of this application must be posted on the claim and a notice thereof must be published in the nearest newspaper.

The rules of law in regard to the ownership, conveyance, and descent of real property are, in general, applicable to mining property. A tenant for life or years of mineral lands is entitled, as an incident of his tenancy, to work open mines thereon, but cannot, unless this right is expressly given, open new mines or revive abandoned mines without becoming liable for waste (q.v.). See LAND; REAL PROPERTY; WATER RIGHTS.

Bibliography. H. N. Copp, *United States*

born siege and in trench warfare. In the discussion of siege and siege works (q.v.) it is shown that when the attacking or besieging troops are no longer able to advance in the open, progress is made by approaches and parallels, in the hope that, if the besieged is not first starved, the besieger may advance close enough under the protection of his own trenches for the delivery of an overground assault. Occasionally, however, the relative force and skill of the combatants are such that the besieged may bring the approach of the besieger by surface trenches to a standstill. This is accomplished by his heavier gunfire or his greater skill, supplemented probably by underground tunnels and countermines which so threaten an overland advance as to make it impracticable. When thus checked the attacker must resort to military mining if he wishes to advance further.

From the last advanced open position he has been able to construct the besieger proceeds underground by a system of shafts and galleries. These vary in size. In general the start is made with large galleries gradually ramifying into

smaller but more numerous galleries whose heads are close together. The principal types recognized in the textbooks are *great* galleries with a height of 6 feet and width of 7 feet, *common* galleries with the same height and half the width, *half* galleries with a height of 4½ feet and width of 3 feet, and *branches* with a height of 3½ feet and width of 2½ feet. The accompanying cut indicates the methods in which these branches develop. The shafts and galleries are usually lined with board casings 2 to 4 inches thick, or with heavy frames placed at intervals holding in position thin sheeting. For the work of excavating special tools are provided, shorter than those used aboveground. Provision is made at frequent intervals for ventilating the tunnels sufficiently to permit the miners to work. Passage from one level to another is by shafts or by inclined slopes. Great care is taken in the preparation of a map, corrected to date and showing the position of the various tunnels and branches, and their relations to each other, both in plan and in elevation. A similar system of tunnels is constructed by the besieged. As the two systems approach each other it becomes the object of each combatant to destroy the system of the other. In doing this the besieger is also normally desirous of forming a crater reaching to the ground above which he can occupy with his troops, thus obtaining new points of vantage on the surface. To prevent the formation of such positions the besieged endeavors to effect his explosions without breaking the surface of the ground.

The tendency in surface warfare is also towards a greater use of trenches both for positions and communications. When the trenches approach each other closely resort is naturally had to mining as one of the means of attack. Small branch galleries are run forward well below the surface and mines placed and exploded

under important points of the enemy's line, as magazines, batteries, and intersection of crossing trenches.

The explosives used in mines and mining have been gunpowder, gun-cotton, dynamite, and mixtures of dynamite with other high explosives. The quantity of explosive to be used depends upon the result desired. A *common* mine is one in which the crater formed has a diameter at the surface approximately twice the depth. Mines with larger charges of powder than will produce this result

the nature of the soil. The general rule for them with gunpowder in ordinary earth is that the charge must be equal in pounds to one-tenth the cube of its distance in feet below the surface.

Mining operations were conducted upon a large scale at the siege of Sebastopol in 1854 and 1855, where the Russians, under the lead of the accomplished engineer, General Todleben, were able to withstand the allies a period of 349 days. Mining was carried on in the sieges of Vicksburg and Petersburg in the Civil War, and in that of Port Arthur in the Russo-Japanese War. Military mining has played an important part in past wars at critical times, and it is probable that in a form adapted to the changing conditions it will always be a big factor in large and protracted land wars. The subject of siege works and military mining is treated in Mercur, *Attack of Fortified Places* (New York, 1894), in the *Chatham Manuals*, especially part iv (London, 1883), and in *Engineer Field Manual*, United States War Department. For submarine mines and torpedo defenses, see *MINE, SUBMARINE; TORPEDO; TRENCH, MILITARY.*

MINETTE, mé'nèt' (Fr., dim. of *mine*, mine, whence Rhenish Ger. *Minette*, iron ore). An igneous rock of granular or porphyritic texture, composed essentially of orthoclase feldspar and biotite. In contrast with the granites, syenites, and diorites, to which it is related, it is rich in ferromagnesian minerals, and hence has a darker color. Minettes generally occur in dikes, and are quite susceptible to weathering agencies.

MINE WORKERS OF AMERICA, THE UNITED. The largest American labor union, whose declared object is "to unite mine employees that produce or handle coal or coke in or around the mines, and ameliorate their condition by means of conciliation, arbitration, or strikes." The officers consist of a president, vice president, and secretary treasurer, who, together with one delegate from each of the 29 districts into which the jurisdiction of the United Mine Workers is divided, constitute the National Executive Board, which has the power to levy assessments and to order general strikes by a two-thirds vote. The government of the union is thus highly centralized. In organization the United Mine Workers is an industrial union, aiming to unite not only miners, but all skilled and unskilled laborers working about coal mines, except mine managers and top bosses. This policy of industrial organization has brought the union into conflicts with the unions of the stationary firemen and of the blacksmiths. In operation the United Mine Workers is a typical new union of the aggressive type. It maintains no extensive system of fraternal benefits, but devotes the greater part of its revenue to the support of strikes and the organization of new unions. Thus, out of the total expenditures of \$2,102,261 in 1913, \$1,621,942 were appropriated to aid and \$290,764 to salaries and expenses of officers and organizers. The control of local strikes rests partly with the national officers. Any local union may strike provided it obtains the consent of the district officers and the national president, but in case either disapprove, an appeal for the permission "to strike may be made to the executive board. Any local union striking in violation of the above provisions shall not be sustained or recog-

SHAFT LINING.

are known as *overcharged* mines; with less, as *undercharged* mines. When given a charge so small that no crater is produced on the surface they are called *camouflets*. To produce a common mine the charge varies considerably with

nized by the national officers." This seems to constitute the only penalty for unauthorized strikes. In the bituminous districts of Illinois, Indiana, Ohio, and Pennsylvania strikes have been practically eliminated by the annual joint conference, or collective bargaining, between the miners and operatives, in which a scale of prices for the following year is adopted and the settlement of further differences provided for by local boards of arbitration. The United Mine Workers was organized Jan. 25, 1890, but its membership decreased rather than increased until the great bituminous coal strike of 1897, during which year the average membership was only 9731. Since that time the membership has increased by leaps and bounds, and in 1905 the national union had an average paid-up membership of 264,950, which increased to 377,682 in 1913. For December, 1913, the paid-up membership was 415,142, distributed among 29 districts and about 3000 local unions. The greatest gains were coincident with the anthracite strikes of 1900 and 1902, the latter of which, lasting more than five months and involving 147,000 workmen, is perhaps the most important strike in American history. The official journal is *The United Mine Worker*, published weekly at Indianapolis. Reports of the biennial conventions, published at Indianapolis, offer much valuable information relating to the organization. See TRADE-UNIONS.

MINGHETTI, mīn-gēt'tè, MARCO (1818-86). An Italian writer and statesman. He was born at Bologna, Nov. 8, 1818, of a wealthy family, and after a university course in political science made a study of the institutions of France, Germany, and Great Britain. On his return to Italy he published an essay on the great commercial advantages of free trade, as existing in England, and espoused with warmth the economic views of Richard Cobden, for the assimilation of which he had been prepared by a knowledge of the teachings of the Tuscan economist Bandini. In 1846 Minghetti began his political career by starting at Bologna a journal of liberal tendencies, *Il Felsineo*; by 1847 he had made such a name for himself that he was called to Rome by Pius IX to become a member of the *Consulta delle Finanze*, and in 1848 he became Minister of Public Works. After the papal change of front, however, Minghetti withdrew from office and joined the army of Charles Albert in Lombardy, where he was warmly received by the King and appointed to the royal staff with the rank of captain. After the battle of Goito he was made a major and distinguished himself in the engagement of Custoza (July 25, 1848). In the autumn of the same year Minghetti was invited to Rome by his friend Count Rossi as a member of the new constitutional ministry. He arrived the day of Rossi's assassination, and after refusing the Pope's request that he take the place of the murdered Minister he returned to the Piedmontese army. On the disastrous conclusion of the war Minghetti resumed his study of political economy and gained the confidence of Cavour, by whom he was consulted during the conferences of Paris. In 1859 he became Secretary General in the Ministry of Foreign Affairs, but resigned with Cavour upon the conclusion of the armistice of Villafranca. Minghetti became Minister of the Interior under Cavour in 1860 and after the death of Cavour held the portfolios of the Interior under Ricasoli and of Finance

under Farini. In March, 1863, he became Prime Minister. He left office in 1864. He went as Ambassador to London in 1868 and was subsequently for a short time at the head of the agricultural and commercial department in the Menabrea ministry (1869). He was Ambassador to Vienna in 1870-73. From 1873 to 1876 he was again at the head of the cabinet, first as Minister of Finance and later as Minister of Foreign Affairs. He spent the last years of his life in study and partial retirement and died at Rome, Dec. 10, 1886. Among his chief writings are: *Del' economia pubblica*, etc. (1859); *Opuscoli letterari ed economici* (1872); *Stato e chiesa* (1878). His speeches in Parliament (*Discorsi parlamentari*) were published in Rome in 1888-90. He was also a student of the fine arts; and, besides lecturing on Raphael and Dante, he produced a work, *Le donne italiane nelle belle arti al secolo XV e XVI* (1877), and a biography of Raphael (1885). His autobiography, *I miei ricordi* (Turin, 1888), appeared after his death.

MINGO (mīn'gō) **JUNCTION**. A city in Jefferson Co., Ohio, about 12 miles northeast of Urbana, on the Pennsylvania Company, the Pittsburgh, Cincinnati, Chicago, and St. Louis, and the Wheeling and Lake Erie railroads (Map: Ohio, J 5). The Carnegie steel works comprise the only manufacturing plant. Farming, dairying, and fruit growing are carried on, and some coal is found in the vicinity. The city owns the water works. Pop., 1900, 2954; 1910, 4049.

MINGRELIA. A former independent feudal state of the Caucasus, bordering on the Black Sea, now included in the Russian Government of Kutais (Map: Russia, F 6). It was a vassal state of Georgia until 1414, when it became independent under its own princes, although tributary to Turkey and Persia. Russia obtained control over it in 1803, but the internal administration was left in the hands of the native chiefs until 1867, when, as a result of a series of peasant uprisings begun in 1857, it was finally annexed by Russia. The inhabitants are mostly Mingrelians, closely allied to the Georgians. Mingrelia is the ancient Colchis.

MINGRELIANS. A tribe of the Kutais region, numbering some 250,000 and belonging to the Georgian group of peoples of the Caucasus. (See MINGRELIA.) In stature they are above the average, and, like the Georgians proper, many of them are of great physical beauty. The Mingrelian language varies considerably from the Georgian prototype. Of the character of the Mingrelians many investigators have entertained no high opinions, setting them down as lazy and unprogressive. The Mingrelians, as are the other Georgians, are more or less Christian. They have a folk literature, consisting of legends, songs, etc., the people being fond of music, the dance, etc. Consult: Telfer, *The Crimea and Transcaucasia* (London, 1876); Chantre, *Recherches anthropologiques dans le Caucase* (Paris, 1885-87); Erckert, *Der Kaukasus und seine Völker* (Leipzig, 1887); Bryce, *Transcaucasia and Ararat* (London, 1897); and, for their place among the Caucasian people, A. Dirr, "Anthropologische und ethnographische Uebersicht über die Völker des Kaukasus," in *Petermann's Mitteilungen*, vol. lviii (Gotha, 1912). See GEORGIANS.

MINHO, mē'nyō. A river of the Iberian Peninsula. See MINO.

MINHO. A province of Portugal. See ENTRE DOURO E MINHO.

MINIATURE PAINTING. Painting in small dimension and of delicate workmanship, usually in water color on vellum or ivory. The term is derived from *minium*, Latin for red lead, a pigment used in illuminating manuscripts, and it was first applied to the pictures which illustrated manuscripts. (See ILLUMINATED MANUSCRIPTS.) Portrait miniatures appeared in devotional manuscripts as early as the late thirteenth century, one of the earliest being a likeness of St. Louis in the *Credo* of Sire de Joinville (c.1287). They attained their highest excellence in the Netherlands and northern France during the fifteenth and early sixteenth centuries. With the introduction of printing, miniatures in manuscripts disappeared; but the transition to the miniature in the modern sense had already been accomplished. This latter is usually a single portrait, oval in shape and from 2 to 4 inches high. Early German and Netherlandish painters sometimes painted them in oil on copper, but they were most frequently executed in water color on vellum, sometimes on chicken skin or cardboard. The use of ivory for this purpose began in the late seventeenth century, but did not become general until the eighteenth. Its introduction changed the character of miniature painting, as more transparent and delicate colors could thus be achieved. This adapted the art especially to the portrayal of flesh tints and other feminine charms, with the result that women replaced men as the principal subjects of miniatures. Miniatures in enamel became popular from about the middle of the seventeenth century, and the subsequent practice of presenting snuff-boxes, cardcases, and other favors greatly promoted the form of the art, particularly in France. During the eighteenth century the increasing demand for tiny miniatures for use in lockets, bracelets, and the like, led to the practice of stippling, in which the color was applied in minute dots, with fine technical effects, but to the detriment of character and sacrifice of general effect.

History. The great charm of miniature painting consists in the intimate view it affords of the sitters, often persons of historical importance. Princes and rulers have always patronized the art, and it has consequently flourished in the national capitals of England, France, and other north European countries. One of the earliest and greatest representatives of the art was Hans Holbein the Younger (1497-1543), whose miniatures have the same qualities as his larger portraits and contain a remarkable grasp of character, with breadth of treatment, impeccable detail, and clear, strong color. His influence is especially evident in the clear and precise art of his follower, Nicholas Hilliard (1537-1619), and in the more richly colored miniatures of the latter's son Lawrence. Isaac Oliver's (c.1567-1617) art is more strongly characterized and both he and his son Peter gave greater roundness to the figures. The greatest master of the seventeenth century was Samuel Cooper (1609-72), who united Van Dyck's elegance with breadth and dignity, in his remarkable portraits of the men of the Commonwealth. The art declined during the early eighteenth century, but again reached a climax in the work of Richard Cosway (1741-1821), the most popular of English miniaturists, whose

gently idealized portraits of women are painted with consummate mastery of delicate color. Of his followers, George Engleheart's art was more virile than his master's; Andrew Plimer was rather insipid, while John Smart united power and refinement. During the nineteenth century, concomitant with a general decline of the art, the so-called large miniature came into vogue, measuring as much as 50 centimeters in height, and characterized by breadth of treatment rather than finish, as may be seen in the works of Andrew Robertson and Sir William Ross. The invention of photography had a disastrous effect on miniature painting, diminishing both the demand for it and the necessity of painting directly from the sitter. The end of the nineteenth century witnessed a general revival.

In France the art was as prolific and important, especially during the eighteenth century, as in England. It was introduced from Flanders by Jean Clouet (died 1540), whose work was continued by his son François and others; but few of these early miniatures can be identified with certainty. The greatest French miniaturist of the seventeenth century was Jean Petitot (1617-91), the first successfully to use enamel. He adopted the style of Van Dyck and invented several new colors, particularly for rendering the flesh tints. His gifted son, Jean Petitot, and numerous followers continued his traditions, which long dominated enamel painting. The most prominent of the stipple engravers was Jean Baptiste Massé (1687-1767). Pierre Adolphe Hall (1739-93), a Swede by birth, excelled all contemporary artists in an art as delicate as it was free and powerful. Many distinguished painters of the eighteenth century practiced also in miniature; such as Largillière, Nattier, and especially Fragonard, who, unhampered by tradition, painted miniatures in a style similar to his canvases. The most popular miniaturists of the Napoleonic era were Dumont, Isabey, and especially J. B. Augustin.

In Germany the art was practiced during the sixteenth century by many early painters, like Lucas Cranach the elder, Ludwig tom Ring, and others. Rosalba Carriera (1675-1757), the talented Venetian, painted miniatures not unlike her pastels, and possessing a certain spiritual quality. Both she and her pupil, Felicitas Sartori Hoffmann, who settled at Dresden, exercised a wide influence upon the German school. This school culminated in the work of Heinrich Friedrich Füger (1751-1818), who practiced chiefly at Vienna, which early in the nineteenth century was an important centre of miniature painting. In the Netherlands, Scandinavia, and Russia the art was also practiced with varying success.

In the United States most of the early painters also attempted miniatures, notably Copley, Gilbert Stuart, C. W. Peale and others of his family, and John Trumbull. But the most important miniaturist of the early period was Edward Greene Malbone (1777-1807), who combined good drawing with an innate feeling for beauty and grace. The general decline of the art during the nineteenth century was followed by an important revival in the late nineties. The American Society of Miniature Painters, founded in 1899, holds annual exhibitions in New York. Its president, William J. Baer, and Laura C. Hills, pioneers in the art, occupy

places of the first rank. Other important artists are Lucia Fairchild Fuller, Martha S. Baker, Florence Mackubin, Virginia Reynolds, L. A. Josephi, W. J. Whitmore and J. W. von Rehling-Quistgaard. American miniature painting is characterized by animation, truth to nature, and the use of clear, bright color.

The most important collections of miniatures are in private possession. One of the finest is that of the late J. P. Morgan (Metropolitan Museum of Art, New York), with examples of nearly all of the prominent English and French miniaturists. Other notable collections belong to the King of England, the German Emperor, the Czar of Russia, King of Sweden, Queen of Holland, and other sovereigns. Among the museums owning good collections are the University Galleries, Oxford; the Wallace collection, London; the Louvre; the Rijks Museum, Amsterdam; and the museums of Dresden and Vienna. There are a number of important private collections in England.

Bibliography. J. L. Propert, *History of Miniature Art* (2 vols., London, 1887), is still valuable from the collector's point of view. Another important work is J. J. Foster, *Miniature Painters, British and Foreign* (2 vols., New York, 1903), and more recent still, Dudley Heath, *Miniatures* (London, 1908), containing a bibliography, and Lemberger, *Portrait Miniatures of Five Centuries* (ib., n. d.). The chief English authority on miniatures is G. C. Williamson, among whose works we cite the brief *Portrait Miniatures from the Time of Holbein* (London, 1897); Andrew and Nathaniel Plimer, *Miniature Painters, their Lives and their Works* (ib., 1903); *History of Painting in Miniature* (2 vols., ib., 1904); *Catalogue of the Collection of Miniatures of J. P. Morgan* (4 vols., ib., 1906), a monumental work. J. W. Bradley, *Dictionary of Miniaturists, Illuminators, Calligraphists, and Copyists* (3 vols., ib., 1887-89), is still valuable as a book of reference; also Ernest Lemberger, *Meisterminiaturen aus fünf Jahrhunderten* (Stuttgart, 1911); F. R. Martin, *Miniature Painting and Painters of Persia, India, and Turkey from the Eighth to the Eighteenth Century* (2 vols., London, 1912); Camille Faust, *Les miniatures de l'Empire et de la Restauration* (Paris, 1913); Fernand de Mély, *Les primitifs et leurs signatures*, vol. i (ib., 1913). See also the bibliography of ILLUMINATED MANUSCRIPTS.

MINIÉ, mé'nyá', CLAUDE ETIENNE (1814-79). A French soldier, ordnance expert, and inventor. He was born in Paris, entered the army as a volunteer, and served in Algeria during several campaigns. He became captain in 1849 and superintendent of the school of ordnance at Vincennes in 1852. In 1858 he was employed by the Egyptian government to superintend a manufactory of arms and a school of gunnery at Cairo. He invented the Minié rifle, which was brought out in 1849 and adopted by the French government, and is especially noteworthy in that it was the first practical introduction of the principle of expansion in the manufacture of projectiles and gave a precision and range previously unknown. The Minié bullet was a conical projectile of lead, hollowed out at the base. When fired the base of the ball expanded, to take the rifling. See SMALL ARMS.

MIN'IM, IN MUSIC. See MENSURABLE MUSIC.

MINIMA. See MAXIMA AND MINIMA.

MIN'IMITES (Lat. *fratres minimi*, least

brethren, so called, in token of still greater humility, by contrast with the *fratres minores*, lesser brethren, the original name of the Franciscans). A Roman Catholic religious order, founded by St. Francis of Paola (q.v.). Devout hermits began to gather round him as early as 1435, and in 1444 a convent was founded at Paterno. The order received papal confirmation in 1474. It spread first into France, when the founder was summoned thither by Louis XI. In Paris they were commonly known as *Bons Hommes*, from the popular name of an older community to whose house at Vincennes they succeeded; and in Spain, to which they next spread, they got the name of Fathers of Victory, from the fact that the recovery of Malaga from the Moors was ascribed to their prayers. The Emperor Maximilian invited them to Germany in 1497. Their first definite rule was not drawn up by the founder until 1493; it was exceedingly austere, forbidding the use not only of meat, but of all animal products, such as butter, eggs, cheese, and milk. The order at one time numbered 450 houses, but later fell into decay and is now represented by 17 convents in Italy, Sicily, and Sardinia, and one in Spain. The superior of a convent has the title of corrector, the head of the whole order being the corrector general. Francis also founded an order for women which never had more than 14 convents and is now almost extinct, and a third order (see TERTIARY) for persons living in the world. Consult D'Attichy, *Histoire générale de l'ordre sacré de Minimes* (2 vols., Paris, 1624), and Heinbucher, *Die Orden und Kongregationen der katholischen Kirche* (Paderborn, 1907).

MIN'IMUM DEVIATION, ANGLE OF. See LIGHT.

MINIMUM WAGE. A term employed to designate the lowest level of earnings affording for a given class of laborers and those naturally dependent upon them means of existence adequate to maintenance in full physical efficiency and social decency. This minimum is difficult to define precisely, and varies from place to place, according to cost of food, housing, fuel, etc. In attempting to define the minimum, recourse is usually had to investigations of the physiologists as to the quantity and variety of food necessary to maintain a worker or a workingman's family in normal health. The results of such investigations, translated into money terms by means of tables of retail prices, supplemented by local studies of house rents, clothing costs, etc., afford the basal figures in minimum wage computations. The minimum thus defined for a normal working-class family in American cities varied from somewhat under \$1500 to \$1800 or a trifle more, according to prices prevailing in 1921.

The minimum wage movement is a concerted effort of workers and social reformers to force wages in the less well-paid trades to a level corresponding with the social minimum as above described. Organized labor in its more successful forms has established a level of wages well above such a minimum. Unskilled laborers often fall far below it, and especially is this true of immigrant labor and the labor of women and children. The discrepancy between wages and a decent minimum of subsistence is most shocking in the case of the sweated trades, where whole populations are sometimes kept in a condition worse than slavery, slowly succumb-

ing to malnutrition and its accompanying maladies.

The first state to undertake seriously to apply political means to the eradication of underpayment was the Australian colony of Victoria. By a law of 1896 boards were constituted in six trades with authority to fix minimum wages. The operation of the law was so satisfactory that it was later extended gradually in scope until in 1915 it covered 141 trades, employing over 150,000 workmen. The success of the Victoria experiment aroused great interest, after 1905, in the United States and Great Britain. Before the close of 1921 twelve American Commonwealths had enacted minimum wage laws. Of these Massachusetts and Nebraska provide for commissions with power to investigate and report on what would be an appropriate minimum wage in specified industries, but have made no provision for forcing employers to pay such wages. California, Colorado, Minnesota, Oregon, Washington and Wisconsin provide for commissions with power, after investigation, to fix rates legally binding upon employers. The State of Utah fixes a legal minimum by statute and makes it a penal offense for employers to pay less than the minimum. All American minimum wage laws, for constitutional reasons, are limited in their application to women and minors. Great Britain, by Act of 1909, established trade boards with power to fix minimum wages in the trades of chain making, machine-made lace finishing, box making and tailoring—notoriously sweated trades. After the great coal strike of 1911 an Act was passed setting up district wage boards in the coal-mining industry.

While the ideal of the minimum wage movement is the establishment of a living minimum in every trade, the practice of trade boards and commissions is much more conservative. Such boards and commissions content themselves with fixing such wages as are practicable, i.e., wages that can be paid without destroying an industry or driving it to another jurisdiction. Thus the minimum is rarely above the level already established by the better-paying establishments. In unorganized trades wages for similar labor vary widely, the establishments ill equipped with machinery or inefficiently managed making up their competitive disadvantage through low wages. The establishment of a minimum wage tends to drive such concerns out of business and thus concentrates production under the control of employers able to pay better wages. In this respect the operation of the minimum wage is similar in its effects to that of the union scale of wages. Like the latter, the minimum wage may become a means of gradually but progressively raising the general level of wages. In the United States the employing classes are, as a rule, though by no means universally, opposed to the introduction of the minimum wage principle. Organized labor also furnishes opponents to the principle, animated by the fear that its application will tend to the disintegration of the organizations. In Victoria, where the plan has passed beyond the experimental stage, opposition on the part of either labor or capital is practically nonexistent.

MINING. The art of working deposits of valuable mineral. The recovery and use of certain of the native metals was practiced by prehistoric peoples. Gold and meteoric iron were appreciated and searched for from very remote

times. Native copper from Lake Superior was extensively mined and used by the aborigines of America. With the advance of civilization, the knowledge of metals increased and ores, or metals in combination, were recognized and utilized and mining proper began. Reference to mining is made in the Bible, and other ancient records prove that the Phœnicians navigated the seas as far as Cornwall, England, in order to obtain tin ores for the manufacture of bronze. The Romans had extensive mines for iron ore in the island of Elba. They also worked the great copper deposits of Rio Tinto, Spain. The mines of Laurium, Greece, were famous in ancient times for their yield of silver. From the old mining districts of Cornwall and from the Erzgebirge and the Harz mountains in Germany miners have gone all over the world, and their skill and experience have done much towards developing mining practice as it exists to-day.

The present article will be confined to a discussion of the art of mining as applied to the working of underground ore bodies. For placer mining see the article *GOLD*; for coal mining see *COAL*; see also *QUARRY*; *DRILL*; *WELL SINKING*. The handling of the ores immediately preparatory to and during the processes involved in extracting the metals is of a nature different from that of mining proper and is frequently done at places far from the mines. These operations are considered in the articles on *ORE DRESSING*, *METALLURGY*, and in the sections devoted to the metallurgy of the various metals and in the adjunct articles there mentioned.

Prospecting. The search for and location of deposits of mineral is called *Prospecting*, and the men performing this work are known as *Prospectors*. The procedure in prospecting a tract of land suspected to contain mineral wealth is thoroughly to traverse it, and to note carefully the familiar indications of the presence of minerals. These indications are often numerous in kind for each mineral and they also vary for different minerals. Generally speaking, coal, gypsum, salt and similar nonmetallic minerals occur in unaltered deposits, i.e., in rocks which have not undergone metamorphism, while the metallic minerals are found in rocks that have undergone metamorphism. These are among the broad indications of the presence or absence of certain minerals.

The geologic age of the rocks is in respect to certain minerals an indication whether these minerals are likely to be found or not. For example, the major portion of the coal deposits of the world have been found in rocks of the Carboniferous age; they exist at times in rocks of subsequent ages but almost never in rocks of preceding ages. The presence of iron is indicated by rustlike staining of earth and rock. The presence or absence of vegetation may also indicate the existence of minerals, e.g., a bed of phosphate rock is commonly indicated by a line of luxuriant vegetation, and the outcrop of a metallic mineral deposit by a lack of vegetation. Beds or deposits of magnetic iron ore and of certain of the nickel ores are frequently located by their attractive influence on the magnetic needle. In prospecting for placers, search is made for existing or ancient watercourses in which deposits of placer material are likely to have been formed. In prospecting for petroleum, natural gas and bitumen, the surface indications looked for are springs of petroleum, oil, or

naphtha; porous rocks saturated with bitumen; springs, pools, or creeks showing bubbles of escaping gas or an iridescent coating of oil. The presence of a mineral deposit of probable economic value having been established, it then becomes necessary to secure title thereto.

Legal Considerations. The laws of the various countries governing this point naturally differ somewhat, and should be carefully studied and complied with. If the deposit is located on government land, a "claim" of variable size, according to the laws of the country or district, is staked out, and when this is opened up sufficiently to have necessitated the expenditure of a certain specified sum of money, a permanent title can be obtained. In the Western States of the United States, claims usually extend 1500 feet along the vein and 300, or less, feet on each side of it. The owner can then follow the vein in depth where it leads him between the vertical planes of his end lines, this irrespective of the vertical projection of his side lines. Because of the irregularity of veins, much litigation has ensued and the law of the United States is open to much criticism. Many authorities consider that it would be better practice to adopt square claims, conveying the mining right to all ore lying vertically beneath them. This is the practice in British Columbia and in Mexico, and is practically so in the eastern United States, where title to the land, unless special reservations are made, carries title to the mining rights. In some States, notably in New York, and in many foreign countries, the State claims peculiar and special proprietary rights to deposits of useful minerals. Much variety also prevails in America in the size of claims other than for deep mines. Gold-bearing placers, i.e., have special sizes depending on local regulations. See MINES AND MINING, IN LAW.

Exploration and Development. Having found a mineral deposit and having obtained a legal hold on its ownership, the next step is its exploration and development. Exploration implies the determination of the extent, the richness, and the physical conditions obtaining. Development implies the confirmation of the results of exploration, and the preparation for subsequent mining operations. As work along both these lines is ordinarily carried on simultaneously, they will be treated under the one heading. The methods which may be employed for the exploration and development of a mineral deposit are: surface excavation; underground workings; churn drilling; and core drilling. It is usually the case that a combination of two or more of these methods will be used.

Surface excavation is strictly a preliminary form of exploration, its object being to determine the surface extent and character of the deposit in order that other methods of exploration may be more intelligently directed. This type of work is extensively used at Cobalt, Canada.

Underground workings, either as shafts or tunnels, may or may not be used as a primary means of exploration. They are, of course, invariably employed in the development stage.

Churn drilling, or the projection of vertical holes of from 6 inches to 9 inches in diameter to considerable depth by means of a special mechanical arrangement (see WELL SINKING), is extensively used in exploring ore bodies of wide area and irregular form. The material recovered from drilling, consisting of mud and

gravel, indicates in a very satisfactory way the character and mineral contents of the rock passed through. Practically all of the so-called "Porphyry" copper properties recently opened have been explored in this manner.

Core drilling, or the projection of small holes 1 inch to 4 inches in diameter at any angle, with the recovery of cores of the rock passed through, gives excellent exploratory data. Unfortunately, however, this method is limited to those districts where the rock to be passed through is generally homogeneous in texture. It has been widely used in the Lake Superior copper, in the Michigan iron, and in the Sudbury nickel districts.

Mining. Having determined the extent, value and physical conditions obtaining, and granting that they indicate the mineral deposit to be of commercial importance, mining proper or the working of the deposit may be undertaken. The problems now presented are: magnitude of operations justified; method of working best suited to the conditions; the mechanical requirements.

Magnitude of Operations Justified. The question of the tonnage advisable to mine annually requires a balancing of four conditions, the total tonnage actually shown by the exploration and development work, the possibilities of finding future additional tonnages, the probable working costs, and the capital investment required. The two last mentioned items will naturally vary with the magnitude of the operations, therefore two or three cases within the legitimate possibilities of the property should be worked out. The desideratum is, of course, that scale of operation which will show the greatest ultimate net profit on the whole investment. In some special cases market conditions affecting the sale of the mine product must also be considered.

Method of Working to be Adopted. The successful solution of this problem requires careful consideration of the three main cost-making operations which enter into mining: the actual breaking down of the ore or stoping; the support of the excavated volume; and the transport of the broken ore to the surface. The governing factors in this consideration are: (a) the shape of the deposit; (b) its location with respect to the surface; (c) the physical character of the ore; (d) the physical character of the surrounding rock; (e) the cost of mine supplies (timber, power, etc.).

Stoping Methods.—The actual breaking down of the ore may be done by: overhand stoping; underhand stoping; side-cut stopes; or caving. Briefly described, the first two methods indicate the position of the workmen with respect to the body of ore to be broken. The third method, "side cut," the breaking of ore over horizontal areas, this usually preparatory to the fourth method or "caving," which implies the breaking down of the ore by its own weight or by the weight of overlying rock. The function of the workmen mentioned above is to drill holes in the rock or ore mass either by hand or by mechanical means. The holes so drilled are later loaded with an explosive which when fired shatters and breaks down the ore or rock.

Support of Mine Workings.—Because of the possible value or nonownership of the surface overlying an ore body it may become necessary to provide for the permanent support of the mined-out areas. Also in order to insure the safety of the workmen underground and to

facilitate mining operations it is invariably necessary to provide temporary support. The methods which may be employed to this end are grouped as follows: mineral pillars; stull timbering; square-set timbering; waste filling; ore filling.

Mineral pillars were probably the oldest form of mine support and are still used in many mines where the value of the ore left standing as pillars is less than the cost of other methods of support. Working by this method implies the removal of the ore from a number of rooms, leaving ribs of unbroken ore at intervals. The proportion of the ore so left to the ore mined depends upon the thickness of the mineral body, the physical character of the ore, and the strength of the roof-forming rock.

Stull timbering is used in connection with relatively narrow and highly inclined deposits of high-value ore. The procedure is to mine out the entire ore area, placing at intervals timbers at right angles to the walls. The amount and size of timber to be used depend on the inclination of the ore body and the strength of the wall rock. This method is universal, and examples are afforded in almost any precious-metal mine.

Square-set Timbering.—In ore bodies where the width mined is greater than can be conveniently spanned by a single stick of timber and where the values contained in the ore are high, square-set timbering may be used, the supporting timbers being built up either rough or squared and so mortised at the ends that they fit together like the edges of a cube, 6 feet on a side. Others fit in with them, each stick entering into four adjacent cubes, and in the end a framework of timber of great strength is built up. This method of mine support was formerly extensively used at Butte, Mont., and at Bisbee, Ariz. Latterly, because of the excessive cost of timber, this method is being discarded.

Waste Filling.—This method, because of high costs for timber, is now widely used both in narrow and wide veins where the value of the ore warrants its complete removal. The procedure is to fill the worked-out volume with either waste rock or with the crushed rock discarded from ore-dressing operations, the only timber used being for temporary support at the immediate working faces and for the maintenance of passageways at intervals through the fill for the removal of ore.

Ore filling, or shrinkage stoping, is used when it is desired to afford a temporary method of support both in those types of ore bodies described as suitable to stull and square-set timbering and in those ore bodies of irregular form which it is intended ultimately to work by caving methods. The system is to break down the ore by overhand stoping and to allow the major portion of it to remain in the stope until mining is completed, only sufficient being drawn off to leave space at the face for the workmen.

Caving.—As the name implies, in this system of mining provision is made only for the temporary support of the overlying rock or ore. When preliminary mining operations have proceeded sufficiently far the temporary supports are withdrawn or broken down, the overlying unsupported mass caving by its own weight or by the weight of the overlying rock. In this manner a large proportion of the ore may be broken without the use of labor or powder.

Also a very material saving is made in not having to support the excavated volume. The conditions which make a caving system possible are an ore body of large area and a surface of no value. The mining and support of the first portions of an ore body which is to be worked by caving will make use of some one method or a combination of methods already described under the heading of mineral pillars, square-set timbering, or shrinkage stoping. Caving is widely used at present in the mining of the so-called "porphyry" copper deposits, in the iron mines of Michigan and Minnesota, and in the Kimberley, South Africa, diamond mines.

Mechanical Requirements. The application and selection of mechanical means to assist in mining operations require careful consideration involving the means which may be employed, the capital investment required, the life of the mine, and the saving in cost per ton to be effected. Many a mine has been equipped with an expensive mechanical outfit which while possibly well thought out from the mechanical engineer's viewpoint has not been justified by the life of the mine. On the other hand, it is frequently the case that a mine may be under-equipped, that the investment of capital in proper machinery would effect a saving in the per-ton cost which would mean the difference between a loss and a profit. In no industry does the saying that "the means must fit the end" hold more true than in mining.

The economics of the case having indicated that the use of machinery is justified, the first question is the choice of the primary motive power. This choice lies between the use of steam, as generated by the burning of wood, coal, or oil; gas, as generated and used direct from wood, coal, or crude oil; electricity, as purchased from power companies or as generated from local hydraulic power.

Having decided upon the cheapest, all things considered, prime mover, the next problem is the consideration of the uses to which the machinery may be applied. These may be divided according to location into (a) underground mechanical equipment and (b) surface mechanical equipment.

Underground mechanical equipment may be further classified into machines facilitating such operations as drilling, transport of broken ore or rock, and pumping.

Mechanical Drilling Machines.—These machines have as their object the drilling of holes in the rock or ore in order that the dynamite or powder used in blasting may be so placed as to obtain the best results. They are in direct competition with hand drilling and, except in prospecting and exploration work, are fast superseding the older method. The requirements of such machines are that they should be mobile, that they should be able to stand the hard usage and unfavorable conditions incidental to underground work, and that they should be as mechanically efficient as is consistent with the previously named conditions. Much ingenuity has been displayed in their design, but the type which has withstood trial and has proved worthy of consideration is that actuated by compressed air. The compressed air, delivered to the machine usually under a pressure of from 70 pounds to 100 pounds per square inch, is ordinarily generated on the surface and conducted underground in pipes, or it may, in the case of isolated individual units used in

development work, be generated underground at a point near the machine, electricity being used as the motive power for the compressor. Air drills are all reciprocating in their action and are of two types—the piston machine, where the reciprocating piston and the drill are joined together, the drill moving backward and forward with the piston, and the hammer machines, in which the piston is of a slightly different design and is not attached to the drill, the piston taking the form of an air-actuated hammer. Drilling machines directly operated by electricity have not proven a success in ore mining, although in mining coal and in quarry work electrically operated "cutters" are widely used. The equipment for generating compressed air will be described hereafter under *Air Compression*. See *DRILL*.

Transport of Broken Ore.—This problem may be twofold—the haulage of the broken ore from the stopes to the shafts and the hoisting from the shaft station to the surface. The consideration of the haulage facilities to be used is a question of the tonnage to be handled in a given period of time and the length of the haul. Originally the transport of ore underground was done on men's backs, and this method is still in use in Mexico, South America, and China. The next development was the use of wheelbarrows, a method still employed by prospectors. The wheelbarrow in turn was followed by the four-wheeled car running on tracks, actuated by man power, animals, or mechanical means. The use of the mine car operated by man power is practically universal in small-tonnage mines of today. In the larger mines where considerable tonnages must be handled and where the distances to be hauled are great it becomes necessary to use a more economical motive power. To that end rope haulage, compressed-air locomotives, storage-battery locomotives, electric trolley motors, and gasoline motors have been developed. The question of a choice between these various types of machines is purely a question of economics and flexibility of service desired.

Pumping Equipment.—In practically all mines some mechanical provision must be made for removing accumulating water, and in many mines the question of handling the water is all-important. The problem of water removal is met in two ways: if the flow is light or if the operations are of a very temporary nature, the water may be removed by bailing or the use of the hoist with a special bucket; if the flow is large or if the work is of a permanent nature, pumps will be installed at suitable locations underground.

Pumps may be classed according to the character of motive power into steam driven, compressed-air driven, and electrically driven. The first two types are practically identical in design for the smaller units; those of larger capacity may be so modified as to give greater mechanical efficiency. As used underground practice indicates that steam and air driven pumps be reciprocating in action and direct connected. Electrically driven pumps, now coming into wide use, are rotary in action and connected either directly or by gears to the motor. The prime requisite of mine-pumping machinery is reliability of action, mechanical efficiency being of secondary importance.

In this connection it may be well to make mention of the Cornish pump, the first pumping

engine to handle large quantities of water successfully. Pumps of this type have been largely superseded by the types described above. There are still, however, places where it is in use and even where it is being installed. The Cornish pump consisted of a steam cylinder located near the shaft mouth, the piston being connected to and actuating a walking beam, the outboard bearing of which was directly above the pumping compartment of the shaft. Through this outboard bearing a line of timber rods passing down the shaft operated an encased plunger at the bottom. The operation of the plunger was similar to that of our deep-well pumps of to-day. On its down stroke the water barrel was filled, on its up stroke the water was lifted and forced into the water line leading to the surface, a corresponding quantity being displaced and discharged. See *PUMPING MACHINERY*.

Surface mechanical equipment must provide for some or all of the following operations: compression of air; hoisting; ventilation; generation of electric power.

Air compression is performed in either one or two stages in units of any size, in specially constructed machines which may be driven by any of the prime movers given. In this operation air at atmospheric pressure is taken into the compressor and compressed to pressures of from 70 pounds to 120 pounds per square inch with a proportional decrease in volume. The air so compressed is piped to the point of use—either the hoist, the pump, or the drilling machines. While it may be successfully argued that the use of a prime mover to generate compressed air which in turn is used to actuate other machinery is accompanied with a loss in efficiency, yet the conditions under which mine machinery must work more than offset this apparent lack in economy. The transmission of compressed air over long distances does not result in transmission losses as high as would be the case were steam piped under similar conditions. Furthermore, in underground workings it would be impossible to allow steam to exhaust into the air, while on the contrary an air exhaust is a benefit. See *AIR COMPRESSOR*.

Hoisting.—In those mines worked through shafts provision must be made for elevating the ore and men to the surface and for lowering men and supplies. This function is performed by machines variously known as hoisting engines, hoists, or winding engines. These engines, usually located near the shaft collar, consist of a drum or reel which may be rotated by means of a steam engine, a compressed-air engine, an electric motor, or a gasoline engine; the engine and drum are erected on the same bedplate, the driving power of the engine or motor being applied either by direct connection, gears, or friction drives. The rotation of the drum or reel winds or unwinds a wire cable which, passing over a sheave wheel supported on a suitable framework, variously known as a head gear, head frame, or galloways frame, directly above the shaft collar, is connected to the carrying receptacle (skip, cage, or bucket) and raises or lowers it at will. The whole operation is analogous to the use of elevators in our present high buildings.

Ventilation.—The problem of providing quantities of fresh air to underground workings has been a very essential part of the development of the coal-mining business. In the smaller metal mines, however, dependence is had on natural

ventilation, except possibly in isolated workings, and upon the exhaust from air drills and pumps. In the larger ore mines, and especially in those in which sulphide ores are found, the present practice is to follow the lead of the coal miner and mechanically to force ventilation, it having been demonstrated that the efficiency of the workman is increased if he has an adequate supply of good air. The blowers used are usually located close to the shaft collar or mine entrance, and are operated, either by direct connection or through gears or belts, by any convenient form of motor. These blowers are employed either to blow air into the workings or to exhaust air from them. They consist of a rotary fan incased in sheet metal and connected with the mine workings by large-diameter sheet-metal pipes. In the case of positive blowers the air taken in by suction at the centre of the fan is discharged at the periphery at a slight pressure into the pipe, which conducts it underground, usually to the lower workings, where it is discharged, the vitiated air being forced upward and out through the shafts or raises. Suction fans operate in the reverse manner, the vitiated air being taken into and carried to the surface through the pipes, while its place is taken by fresh air entering at the shaft collar.

Electric Power.—As has been indicated, electricity as a motive power for mining machinery has a wide range of usefulness. Perhaps the one factor which more than any other has caused its wide use is the ease, efficiency, and cheapness with which it may be conveyed from the point of generation to the place of use. The production of the electric power in the first place is a function of the surface mechanical equipment. The type of generating machine or dynamo will depend on the character of the current desired, which in turn is determined by the use to which it is to be put.

Closely associated with the surface mechanical equipment above described are the shops which must be provided for the repair and maintenance of the mechanical plant. The magnitude and equipment of these shops will depend upon the size of the mine and upon its distance from supply centres. In any event there must be provided a blacksmith shop, whose function it is to sharpen and maintain drills used underground, be they hand or machine. The normal small mine ordinarily has a combination blacksmith and machine shop, whose equipment will include a drill press and small lathe, in addition to a drill-sharpening and blacksmithing outfit.

Organization. The active life history of any mineral deposit can be divided into two periods—that of exploration and development and that of working or operating. During the first period there should be employed a consulting engineer to advise regarding the potential resources of the deposit and to outline the scheme of exploration and development to be followed. The man chosen for this work should have a thorough knowledge of mining geology, of practical mine management, and should have common sense. Needless to say he must be honest. The requirements are such that it is safe to say that no man with less than 10 years' active mining experience is likely to qualify. Under the direction of the consulting engineer will be the field manager or superintendent, whose chief qualifications should be getting work done under any and all conditions cheaply and quickly. On small operations he will probably act as his own

bookkeeper, chemist, and surveyor. Under the superintendent will be foremen and shift bosses, who are directly in charge of the various squads of workmen.

During the operating or working period the organization will be divided into departments as follows: mining, mechanical, chemical, engineering, clerical, and metallurgical. The heads of each department report to the superintendent. It may be that on small properties the chemical and engineering departments will be merged and will be represented on the pay roll by one man or two men only. On such a property it is probable that the mechanical department would consist of not more than three or four men. On the other hand, large properties naturally mean enlarged departments with superintendents and foremen in each. Whether the work be large or small, it is imperative that there shall be an absolute placing of authority and responsibility.

Economics. Good business principles should apply to mining, although this does not seem to be realized by most business men investing in and operating mines. To use an analogy, a mineral deposit should be likened to a manufacturing enterprise in which the quantity of raw material is limited. If looked upon in this light there immediately present themselves three main items for consideration: (1) the sale value of the possible product; (2) the cost of production; and (3) the capital investment needed. The first item, the sale value of the product, requires an inquiry into what is a fair average selling price and what is the breadth of the market. The second, the cost of production, requires a special knowledge of mine and metallurgical operations and is best answered by specialists in the business and by inquiry as to what other people have done under like conditions. The third, or capital investment required, should likewise be answered by a specialist. With these three considerations investigated and answered it is a simple problem to figure the net returns to be expected, both annually and in total, and, applying this to the capital investment called for, to figure a percentage return on money invested. It should be remembered, however, that the profits resultant from mining investments must provide not only for interest on money expended but also for amortization of the investment itself within the life of the mine. Unfortunately the average mining investor misses this last point and forgets entirely that his dividend has such a twofold nature. It is because of this fact that the dividends paid or anticipated from an investment in a mining enterprise, in order to be at all attractive, must be greater than those paid by other industrials.

The question of what constitutes a proper and attractive return on such investments necessitates a consideration of the chances to be taken, which chances are dependent upon the degree of development and upon the geological and mineralogical character of the mineral deposit. Based on their degree development, mining properties may be broadly classed under two headings—prospects, or properties showing little or no ore developed, and mines, or properties having developed ore. In the first class, or prospects, it will be seen that any investment therein must be considered as purely speculative, for not only are the possible profits from the working of the ore, should it be found, a matter of estimate, but also the finding of ore in com-

mercial quantities is problematical. The only safeguards for such a speculative investment are the recommendation of an honest and able mining engineer, the assurance that sufficient cash has been raised to carry out development work as outlined, and that the management be honest and efficient. To assume such chances the investor is warranted in insisting that possible profits should be several times his investment.

In the second class, or mines, the question of a proper return on money invested is dependent on the size of the deposit and the character of the ore. In the case of some of the larger mining companies operating extensive deposits of iron, copper, lead, or gold ores where the life of the deposits can be safely calculated to run for many years, the elements of chance incidental to mining are so far eliminated that the investor would be justified in investing on the basis of 10 per cent annual profit in addition to the return of his capital within the life of the mine. In those companies operating mines where the ore bodies are small, as is the case in most of the precious-metal mines, and "where the profit in sight (the only guarantee in mine investment) is below the price of investment, the percentage of annual return should increase in proportion."

In any event the prospective investor should have submitted to him a written or printed statement covering the following points: name of company or property; location of holdings; area and character of holdings; status of ownership; classification of property, whether a prospect or a mine; character of product. In addition to the above general data there should be submitted, if the property is a prospect, the recommendations of a reliable engineer both as to the possible future of the property and the probable expenditures necessary for exploration and development work. If the property is a mine the statement of the engineer should indicate the amount and character of development work done; the amount and value of the ore developed; the operating costs, either as at present or as estimated; the justified working scale; the life of the developed ore; the probable total and annual profits; and the possibility of finding additional ore. In the case of the owner being a corporation a formal financial statement should be made.

With this information in hand the possible investor is in a position to form some opinion himself regarding the merits of the proposition and intelligently to seek advice of his own engineer, who will advise as to whether or not the purchase should be made, an option taken, or the proposition turned down, as the case may require.

MINING, PLACER. See GOLD.

MINING CLAIM. See MINES AND MINING, IN LAW.

MINING ENGINEERS, AMERICAN INSTITUTE OF. A society founded in 1871 for the promotion of the arts and sciences connected with the economical production of minerals and metals, the discussion of professional papers, and the circulation of information connected with mining interests. It had a membership at the beginning of 1915 of over 5000, made up of honorary, elected, and associate members. The annual meeting of the institute is held in February, with other meetings during the year as authorized by the council. The institute publishes three volumes of *Transactions* annually and a monthly *Bulletin* which appears on the first of each month. The headquarters of the institute are in the Engineering Building in New York City.

MINING LOCOMOTIVES. See ELECTRIC RAILWAYS; LOCOMOTIVE; COMPRESSED-AIR LOCOMOTIVE; STEAM ENGINE.

MINISTER (Lat., servant). A public functionary who has the chief direction of any department in a state government. (See MINISTRY.) Also the delegate or representative of a sovereign at a foreign court to treat of affairs of state. Every independent state has a right to send public ministers to any other sovereign state with which it desires to preserve relations of amity. Semisovereign states have generally been considered not to possess the *jus legationis* unless when delegated to them by the state on which they are dependent. The right of confederated states to send public ministers to each other, or to foreign states, depends on the nature and constitution of the union by which they are bound together. The constitution of the United Provinces of the Low Countries and of the old German Empire preserved this right to the individual states or princes, as do the present constitutions of the German Empire and Swiss Confederation. The Constitution of the United States either greatly modifies or entirely takes away the *jus legationis* of the individual States. Every sovereign state has a right to receive public ministers from other powers, unless where obligations to the contrary have been entered into by treaty. Diplomatic usage recognizes four orders of public ministers. These, as defined by the Congress of Vienna (1815), supplemented by that of Aix-la-Chapelle (1818), are the following: (1) ambassadors and papal legates or nuncios; (2) envoys and

ministers accredited to sovereigns; (3) ministers resident; (4) *chargés d'affaires*. Ministers of the first order possess the representative character in the highest degree, representing the state or sovereign sending them not only in the particular affairs with which they are charged, but in all other matters of state; they may claim the same honors as would be accorded their sovereigns if present in person. A principle of reciprocity is recognized in the class of diplomatic agents sent. States enjoying the honors of royalty send to each other ministers of the first class; so also in some cases do those states which do not enjoy them; but it is said that no state not possessed of such honors is entitled as matter of right to the acceptance by a royal or Imperial state of a minister of the first class.

Besides these orders of ministers there are other diplomatic agents occasionally recognized—as deputies sent to a congress or confederacy of states and commissioners sent to settle territorial limits or disputes concerning jurisdiction. These are generally considered to enjoy the privileges of ministers of the second and third orders. Ministers mediators are ministers sent by two powers between which a dispute has arisen to a foreign court or congress where a third power, or several powers, have, with the consent of the two powers at variance, offered to mediate between them.

Ministers sent to a congress or diet have usually no credentials, but merely a full power, of which an authenticated copy is delivered into the hands of a directing minister, or minister mediator.

The title "excellency" has since the peace of Westphalia been accorded to all diplomatic agents of the first class; and in some courts it is extended to ministers of the second class, or at least to those sent by the Great Powers.

By the American system ministers to exercise diplomatic functions at foreign courts are appointed by the President and confirmed by the Senate. See *AMBASSADOR*; *ENVOY*; *CONSUL*; *MERCANTILE*; *DIPLOMACY*; *DIPLOMATIC AGENTS*; *INVOLABILITY*. See also *CABINET*. Consult the authorities referred to under the last three of these titles.

MINISTERIAL OFFICER. An officer whose functions consist in executing the command of a superior, or in performing a duty definitely prescribed by law. Its propriety is not left to his judgment or discretion. He is legally bound to perform it; and for a failure to do his duty he is liable in damages to the person in whose favor the duty was to be discharged. A policeman, sheriff, or marshal having a writ for the arrest of a designated person is liable for false imprisonment if he arrests any other person than the one named. Or, he may have arrested the wrong person because of mistaken information, yet having acted with due caution in making his inquiries. In both cases he is liable. As a rule the ministerial officer acts at his peril. Perhaps the harshest application of this rule is seen when he enforces legal process under an unconstitutional statute. If, on appeal, the statute is declared unconstitutional by the highest court of the state, the judges of the lower court are not civilly responsible for their blunder, but the sheriff who seized and sold property under the execution must respond to the owner for its value.

Often times a judicial officer or a legislative

body is required to act in a ministerial or executive capacity. Generally speaking, a judge acts ministerially when an application for a writ of *habeas corpus* is made to him. The law does not leave the granting or withholding of this writ to his discretion. A justice of the peace who has rendered judgment in a case before him is under a peremptory duty to issue an execution thereon at the request of the judgment creditor. In issuing or refusing it he acts ministerially, not judicially. If a statute charges a county judge with the duty of selecting jurors for the various courts sitting in the county, his acts under the statute are ministerial. Whether an act required by law of an officer is judicial or ministerial depends upon its character, and not on the rank of the actor. See *OFFICER*, and the articles there referred to.

MINISTER'S WOOING, THE. A story by Harriet Beecher Stowe, published as a serial in the *Atlantic Monthly* (1859).

MINISTRY. A body consisting usually of the heads of the chief executive or administrative departments of a government, and constituting an advisory council of the sovereign. In several European countries there is a chief minister who has a certain precedence in rank and authority over his colleagues and who is known as the premier or prime minister. In several others the chief minister bears the title of minister president and enjoys a certain precedence in dignity over his colleagues, but exercises no authority over them. Everywhere the right of selecting the members of the ministry belongs to the chief executive. In those countries, like England, where the crown is only the nominal executive, the head of the state selects only the prime minister and intrusts the selection of the others to him. In the German Empire, the Kingdom of Prussia, the Empire of Japan, and the American republics, where the ministers are not responsible to the legislature for their political policy, they are all appointed directly by the chief executive without being restricted to acknowledged party leaders. It is a general rule in European countries that members of Parliament may, with the approval of their constituents, serve as ministers. But, whether members of Parliament or not, ministers are entitled to sit in either House and to participate freely in the discussion of measures in which they are interested.

In general, the term "ministry" is synonymous with the term "cabinet" (q.v.), but there are exceptions. Thus, in Great Britain, the ministry includes, in addition to members of the cabinet, all those political undersecretaries who have seats in Parliament (at present about 40 in number) and who are expected to resign when their policy is defeated in the House of Commons; while the cabinet consists of a certain number of ministers (22 in 1915) who control the policy of the government and preside over the chief administrative departments. Thus it will be seen that not all the ministers are members of the cabinet. On the other hand, it may happen that some members of the cabinet will have no administrative duties. Such members are known as ministers without portfolios. Departments of administration over which ministers are generally placed are: foreign affairs, war, finance, justice, public education, public worship, navy, commerce, post and telegraphs, and colonies. In those countries where ministers are responsible to the chief executive they

act independently of one another in the conduct of their administrative departments, and their responsibility is individual rather than collective.

MINITARI, mē'né-tā'rē, or **HIDATSA**, hē-dit'sā. A tribe of Siouan stock (q.v.), closely related to the Crow (q.v.). Since known to the whites they have resided nearly in their present position on the Missouri River in North Dakota in close alliance with the Mandan and Arikara (q.v.). They call themselves Hidatsa, their popular name being of Sioux or Mandan origin and said to signify "people who have crossed over the water." Both they and a detached band of Arapaho were known to the French as Gros Ventres (q.v.). They occupied permanent stockaded villages of circular earth-covered log houses along the bluffs of the Missouri, where they had fields of corn, pumpkins, and sunflowers and made periodic excursions into the open plains to hunt the buffalo, at which times they lived in tepees. Like their allied tribes, they had elaborate ceremonials and social organization. They have been uniformly friendly to the whites. In 1804 they were estimated at 2500, but have decreased rapidly, first from the smallpox of 1837 and later from the diminished food supply consequent upon the destruction of the buffalo. They number now about 547 and live with the Mandan and Arikara upon the reservation at Fort Berthold. Consult Washington Matthews, *Ethnology and Philology of the Hidatsa Indians* (Washington, 1877), and R. H. Lowie, "Societies of the Crow, Hidatsa, and Mandan Indians," in *American Museum of Natural History, Anthropological Papers*, vol. xi (New York, 1913).

MINIUM, or **RED LEAD**. A beautifully scarlet crystalline substance consisting chiefly of lead orthoplumbate, $2\text{PbO} \cdot \text{PbO}_2$. It is made by cautiously heating massicot or white lead in a reverberatory furnace or in special barrel-shaped ovens open at both ends. If heated, minium gradually changes its color, becoming violet and ultimately black; but it regains its original color on cooling. If ignited in the air, minium is converted into the monoxide of lead. Minium is used as a mineral color, yielding a fine paint. It is also employed in the manufacture of flint glass. See **LEAD**.

MINIUS. The Roman name for the river Miño.

MINIVET. One of a group of about 20 species of small shrike-like birds of the Oriental region. The males are, in general, black and rose, while the females are gray and saffron. Consult Blythe, *Mammals and Birds of Burma* (London, 1875), and other authorities on Oriental ornithology cited under **BIRD**.

MINK (probably from Swed. *mänk*, mink). Any of several species of weasel-like animals of the genus *Putorius*, family Mustelidae, distinguished from the martens, stoats, etc., by their semiaquatic habits and certain peculiarities of dentition. Very recently *Putorius* has been considered as a subgenus of *Mustela*. The American mink (*Putorius vison*) is found throughout North America, but especially in the northern and mountainous parts. The European mink (*Putorius lutreola*), usually called *norz* or *mänk*, occurs in Finland, Poland, Scandinavia, and Russia and formerly extended as far west as central Germany. The mink of Siberia (*Putorius sibirica*) is a quite distinct but little-known species. The American mink is somewhat larger than the European species (15 to 18 inches long, besides the tail, 9 inches) and is

further distinguished by the black upper lip; in the European mink the upper lip is white.

Minks are inhabitants of well-watered areas, haunting the banks of streams and borders of ponds in search of their food and making their homes in burrows which open near the water. They are excellent swimmers, having the feet partially webbed, and spend much time in the water. Although, like other Mustelidae, they eat birds, small mammals, and eggs, the principal food of minks comes from the water; thus, fish, frogs, salamanders, crayfish, and even mollusks form their chief diet, and muskrats and other water-loving mammals also fall prey to their voracity. The fur of the mink is of great value commercially, though the price varies much with color and quality. (See **FUR** AND **THE FUR TRADE**.) Minks are usually brown, sometimes rather light, but more often very dark, especially along the middorsal line. The darker the animal the more valuable it is. The fur is made up of a dense undercoat and an outer coat of long, shining hairs, and the skins from the coldest regions are usually the most valuable. Like all its near relatives, the mink is bloodthirsty and cruel. It is very courageous, and when cornered is savage. The young are born in the early spring, usually in a hole in the bank of some body of water, where plenty of food is easily obtained. The number of young is about six in a litter. The mink is second only to the skunk in the strength, penetrating power, and nauseousness of the odor of the secretion in the anal glands, but fortunately it is only when the animal is greatly enraged that the odor becomes very disagreeable. Minks are said to be easily tamed if taken young, and to enjoy being petted, but their temper is capricious, and as they grow old they become dangerous. Civilization seems to have little effect upon them, there being few districts so completely cleared or densely settled as not to afford them some sort of refuge.

Consult: Audubon and Bachman, *Quadrupeds of North America* (New York, 1851); Elliott Coues, *Fur-Bearing Animals* (Washington, 1879); Stone and Cram, *American Animals* (New York, 1902); E. T. Seton, *Life-Histories of Northern Animals* (ib., 1909); Ned Hollister, "A Synopsis of the American Minks," in *United States National Museum, Proceedings*, vol. xlv (Washington, 1913). See **FUR-BEARING ANIMALS**.

MINK FROG, **HOOSTER FROG**, or **NORTHERN FROG**. A small frog (*Rana septentrionalis*) of the northwestern United States. It is $2\frac{1}{4}$ inches long from nose to vent, dark olive green above, with sooty-brown bars and blotches, and pure white underneath. Its hazel iris, minky color, and quiet solitary habits distinguish it from others. A detailed account of its features and ecology was given by J. H. Garnier in the *American Naturalist*, vol. xvii (Philadelphia, 1883).

MIN'KOPIS. The inhabitants of the Andaman Islands. See **MINGOPIES**.

MINKOWSKI, min-kóf'skī, HERMANN (1864-1909). A mathematician, born at Alexoten, Russia, but a resident of Germany. He was educated at the universities of Berlin and Königsberg (Ph.D., 1885) and served as a lecturer (1887-93) and assistant professor of mathematics (1893-94) at Bonn and as professor of mathematics at Königsberg (1894-96), at the Zurich Polytechnic (1896-1902), and at Göttingen (1902-09). His publications include: *Geometrie der Zahlen* (1896); *Diophantische Approxima-*

tionen, eine Einführung in die Zahlentheorie (1907); *Gesammelte Abhandlungen* (1911).

MINNA VON BARNHELM, min'nä fön bärn'hëlm. A comedy by Lessing, produced at Hamburg in 1767.

MINNEAPOLIS. A city and the county seat of Ottawa Co., Kans., 128 miles by rail west of Topeka, on the Solomon River and on the Union Pacific and the Atchison, Topeka, and Santa Fe railroads (Map: Kansas, E 4). It derives considerable trade from the adjacent farming and stock-raising country and has grain elevators, flour mills, carriage shops, a foundry, etc. Building stone is quarried in the vicinity. There are a public-school library and municipally owned water works. Pop., 1900, 1727; 1910, 1895.

MINNEAPOLIS. The largest city of the State of Minnesota and the county seat of Hennepin County, situated at the Falls of St. Anthony, on the Mississippi River, above St. Paul, the suburbs of which join those of Minneapolis, the two municipalities being termed Twin Cities (Map: Minnesota, D 6). The river, which divides the city into unequal portions, the main portion being on the right bank, is crossed by a number of massive highway and railroad bridges. The Falls of St. Anthony are in the heart of the manufacturing district.

Minneapolis stands on a gently undulating plateau, 800 feet above sea level, in a picturesque lake region much frequented as a place of resort. There are several lakes within the city limits, and of others in the immediate vicinity, Lake Minnetonka is the largest and most popular. The city is about 10 miles long by 6 in width and has an area of 53 square miles. Its streets are broad and regular. An extensive park system (3783 acres) has been developed, embracing several lakes, 50 parks, and 50 miles of parkway, almost all of which are skirted by a wide boulevard known as the Grand Rounds. Of particular note are Kenwood Boulevard (150 feet wide), Loring and Gateway parks, in the centre of the city, and Minnehaha Park, containing the Falls of Minnehaha, 50 feet in height. Adjoining the park are the beautiful grounds of the State Soldiers Home. Minneapolis has many handsome public and business edifices, besides a number of attractive churches. Among these are the cathedrals of the Immaculate Conception and St. Mark; Central High School; Minneapolis Institute of Arts; the county courthouse and city hall building, erected in 1900 at a cost of \$3,500,000 and offering from its main tower, 345 feet high, a superb view of the city; the public library and post office, both fine Romanesque structures; Raddison, Dyckman, and Andrews hotels; and the Plymouth, Andrus, Palace, McKnight, Security Bank, and Soo First National Bank buildings.

Commerce and Industry. The conditions which have contributed most to the industrial development of Minneapolis are the advantages afforded by the Falls of St. Anthony and their convenient location in relation to the abundant grain and timber of the Northwest. Excellent transportation facilities give the city command over these supplies and over the markets of the country, its jobbing trade in 1914 having amounted to about \$300,000,000. Twenty-two lines of railway, operated under 10 systems, enter the city, and a complete system of interurban electric lines has been effected. With these advantages Minneapolis has developed

into the foremost city of the Northwest, being noted particularly for its manufacturing and wholesale interests. The first manufactory in the State was established at the Falls of St. Anthony. It was used first as a saw mill and then as a flour mill. The power afforded by the Falls has been utilized more and more, until Minneapolis has become the largest flour and lumber market in the world. The water power at the Falls of St. Anthony was developed, previous to 1879, to yield 30,000 horse power, and in 1897 a new dam, giving 10,000 horse power, was completed. The United States government is (1915) constructing a system of locks and dams below the Falls which will add 40,000 horse power and which will place Minneapolis at the head of navigation. For a number of years the lumber industry was most important, but after the introduction of improved processes of flour milling in the seventies, the latter industry surpassed lumber manufacturing and has since rapidly outstripped it. The flour mills in the Falls district are now the largest in the world. The value of their output in 1905 was \$62,700,000, while in 1914 this was increased to \$90,000,000. Lumber products worth \$12,000,000 were made in the same year, and an equal value each of machinery, linseed oil and meal, and food and clothing. Other manufactures brought the total value of the city's industrial output in 1914 to \$165,000,000, on an invested capital of \$90,000,000. Minneapolis was the first city in the United States definitely to plan a combined factory and residence district wherein industries are guaranteed the trackage and transfer facilities that they need and where workmen may make their homes among natural woods and gardens. In 1914 there were received in the city 200,000,000 bushels of grain, of which 90,000,000 were wheat. Fifty elevators, with a capacity of 40,000,000 bushels, stored and cleaned this grain.

Finance. According to the Minnesota law, assessment is made on a 40 per cent valuation. The assessed valuation of the city in 1914 was \$196,303,280. This, at a rate of 35.77 mills, yielded a revenue of \$6,644,866.08. Of this amount there was spent: for schools, \$2,037,831; for police and fire protection, \$1,019,000; for interest on debt, \$850,000. The city owns and operates its water works, which, with a recently installed filtration plant, are valued at \$1,500,000. Another municipal enterprise is a garbage consumer, from which enough current is obtained to light a considerable portion of the city. The bonded indebtedness is \$22,237,200, offset by a sinking fund of \$4,087,203 for the retirement of bonds. The city is the home of the Federal reserve bank for the ninth district. Its 25 banks have a capital of \$8,000,000 and a total deposit of \$120,000,000.

Education. Minneapolis sends 50,000 children to the public schools, and of these 6000 are in the five high schools. The city is coöperating with the Dunwoody Institute, a vocational school for boys, and is itself conducting a similar school for girls. The University of Minnesota (q.v.) is situated here, while other institutions include Stanley Hall, Graham Hall, and St. Margaret's Academy, for girls; Blake School and De La Salle Institute, for boys; Augsburg Seminary (Lutheran), Minnesota College; the Johnson School of Music and the Northwestern Conservatory of Music; the Handicraft Guild and the Minneapolis School of Fine Arts. More than 10,000 pupils attend these schools and the

nine commercial colleges. There is a public library, with 290,000 volumes for circulation from its main building and from 35 branches and stations.

Within the last 10 years the city has made wonderful progress in the arts. The Minneapolis Symphony Orchestra (q.v.) is recognized as one of the best organizations of its kind in America, and the Minneapolis Institute of Arts, dedicated in 1915, together with the private gallery of T. B. Walker, makes the city conspicuous as a music and art centre. The interest in music is manifest in the many choral and orchestral clubs, and the interest in art in the fine sculptural works to be seen in different parts of the city. Notable among these are French's statue of Governor Pillsbury, on the university grounds, and Jacob Fjelde's figure of Ole Bull, in Loring Park, and of Hiawatha, in Minnehaha Park.

Government. Minneapolis is governed under what is known as the Federal plan. A council, consisting of two aldermen from each of the 13 wards, legislates. Its powers, however, are limited by the State to such an extent that the city has endeavored to secure a new charter that will give home rule and result in greater efficiency. The mayor, treasurer, and comptroller are the executive officers. The mayor is in charge of the police. He has the power of veto on all council measures, subject to the usual two-thirds overruling vote. In addition to these officers there are the school, park, and library boards, the members of which are elected; a board of corrections and charities, consisting of the mayor and four of his appointees; and the board of tax levy, composed of the mayor, the presidents of the council, school, park, and library boards, and one county commissioner. This board meets each year to determine the rate. Two elected judges preside over the municipal court. Elections are held biennially. A civil-service commission examines applicants for positions in city offices and on city works. Other special features of the government are the patrol-limits system, by which saloons are confined to a small area in the centre of the city, and a public-morals board, which advises the mayor and the council as to the moral condition of the city.

History. The first white man known to have visited the site of Minneapolis was Father Hennepin. In August of 1680, while on his way to rejoin La Salle, he passed the falls and named them St. Anthony. Various French fur traders followed Hennepin, and Jonathan Carver (q.v.) in 1766 made a journey up the Mississippi and Minnesota rivers. Upon his return he published a glowing account of the country, emphasizing its "exceeding beauty" and its great commercial possibilities. In 1805-06 Lieut. Zebulon Pike was sent into the country of the Sioux to induce them to make peace with the Chippewas and to assert the right of the United States against that of the English traders established on the upper Mississippi. In the treaty that Pike concluded with the Sioux was a clause ceding to the United States a strip of territory extending from the confluence of the Mississippi and Minnesota rivers northward for 9 miles on each bank of the Mississippi. This included the Falls of St. Anthony and the site of Minneapolis. In 1819 the United States government, following the suggestion of Major Long and in compliance with the request of the Astor fur interests, sent Colonel Leavenworth to build a fort at the mouth

of the Minnesota. Leavenworth's successor, Col. Josiah Snelling, placed the fort, named for him, on the near-by bluff. In 1823 the government built a mill (where a great mill now stands) for the manufacture of lumber and flour for the fort. Before the land on the east bank of the river had been opened to settlement several of the fort's officers had squatted on claims from which they proposed to control the water-power rights. Franklin Steele held the choice site in 1848, when settlement was legalized. He platted a village, St. Anthony, in that year and built the first commercial saw mill. Maine lumbermen soon hurried to the new village, and it grew rapidly. Shortly afterward a university was established. Like the soldiers, however, the newcomers squatted on government land embraced in the Fort Snelling reservation on the west bank of the Mississippi. Col. John Stevens, holding for Steele a claim facing his town site, built the first house in Minneapolis proper in 1850, on the site of the Union Station. Before the claims were legalized in 1855 a village of considerable importance had developed, but after that date it grew more rapidly than St. Anthony. The settlement, having previously borne several names in succession, was incorporated in 1856 as the town and in 1867 as the city of Minneapolis. In 1872 the city of St. Anthony, directly across the river, which had been settled in 1837 and incorporated in 1855, was annexed. After 1860 the growth of the city was exceedingly rapid. From 1886 to 1893 a large Industrial Exposition was held here, and in 1892 the Republican National Convention met in the Exposition Building. Pop., 1870, 13,066; 1880, 46,887; 1890, 164,738; 1900, 202,718; 1910, 301,408, including 85,938 persons of foreign birth; 1914 (U. S. est.), 343,466; 1920, 380,582. Consult: Isaac Atwater, *History of the City of Minneapolis* (New York, 1893); W. W. Polwell, *Minnesota, the North Star State* (Boston, 1908); H. B. Hudson, *A Half Century of Minneapolis* (Minneapolis, 1910); E. Dudley Parsons, *The Story of Minneapolis* (Minneapolis, 1913).

MINNEAPOLIS SYMPHONY ORCHESTRA. In 1903 a number of music lovers of Minneapolis formed the Orchestral Association of Minneapolis. Having raised a guarantee fund of \$10,000, they established the Minneapolis Symphony Orchestra of 60 performers, with Emil Oberhoffer as conductor. Immediately the organization took its place among the foremost symphony orchestras of the United States, and a new fund was subscribed for five years. In 1915 the guarantee fund amounted to \$65,000. The number of players was gradually increased from 60 to 90, Mr. Oberhoffer being retained all the time as conductor. At present the orchestra plays about 40 concerts a season in its home town and an average of 130 concerts on tours extending all over the United States. It owns an extensive library.

MIN'NEDO'SA. The chief town of Marquette electoral division, Manitoba, Canada, on Little Saskatchewan River and on the Canadian Pacific Railway, 125 miles west-northwest (direct) of Winnipeg (Map: Manitoba, C 3). Its industrial establishments include five grain elevators, three lumber yards, and a sash and door factory. The town has an electric-light and telephone system. Pop., 1901, 1052; 1911, 1483; 1915 (local est.), 2000.

MINNEHAHA, min'nē-hā'hā. The heroine of Longfellow's Indian poem, *Hiawatha*, who is

represented as the daughter of an old arrow maker. The name Minnehaha. (Sioux *Mini-haha*, curling water) is borne by a picturesque cascade, about 50 feet high, in the Minnehaha River, a small stream emptying into the Mississippi at Minneapolis, Minn. It may be mentioned that in Longfellow's work the hero has an Iroquois name, the heroine a Sioux name, while the poem itself is based upon the Ojibwa legends published in Schoolcraft's *Algie Researches*.

MINNESINGER. The common name for mediæval German lyric poets, preceding the meistersinger (q.v.), and especially for German court lyrists of the twelfth and thirteenth centuries, because their principal theme was *minne*, or love. Among other subjects of minnesong were nature, religion, patriotism, politics, and homage to princely patrons. Heinrich von Veldeke (q.v.), one of the earliest minnesingers, was also an epic poet. Minne poetry has three epochs. In the first, a little after 1150, with Der von Kürenberg as its earliest-named poet, lyric poetry begins to free itself from the epic; the second is its brilliant period, with Walther von der Vogelweide (q.v.) as its most brilliant example; the third, beginning about 1300, with Oswald von Wolkenstein as its last representative, marks its decline and the rise of the meistersang, cultivated by the meistersinger (q.v.). The metrical form of these lyrics was at first simple, though somewhat varied, with rhyme and, with decreasing frequency, assonance. Der von Kürenberg's four-line stanza with one extra beat in the last half line became so popular on the Danube that it was adopted by the writers of the Nibelungenlied (q.v.). Under French influence the form became more artificial. Each minnesinger felt a proprietorship in such metrical forms as he had originated. The ditties of early singers such as Dietmar von Aist, Der von Kürenberg, Meinloh von Sevelingen, and the burgraves of Regensburg and Rietenburg are marked by simplicity of thought and by absence of reaping. The minnesingers, like the troubadours (q.v.), thrived in the heyday of chivalry. How deeply each of the minnesingers was influenced by the troubadours, and to what degree they drew upon the traditions and customs of their own land, or finally to what extent they imitated once genuine emotions or spoke from their hearts, is often extremely problematical. Certainly the oldest poems utter true experience and represent the lover as wooing with ardor but proud self-respect; but later, under Provençal influence, he appears as the cringing vassal of his lady love. Some of the most ancient German poems are put into woman's mouth, but we can scarcely conclude that women were therefore among the minnesingers, though several ladies, as, e.g., the Countess of Dia, wrote love poems in Provençal.

With the more artful verses of the Burgrave Rietenburg, Provençal influence becomes clear. To all people *minne* meant love, but to the lordlier poets or to those who sang in their halls *minne* had an exalted significance. The older and far more genuine sentiment between men and women becomes either Platonic affection or sensual desire. We shall find that the minnesingers were merely doing what had been done a little sooner by the troubadours, but the minnesong was not so brilliant, though it was almost as artificial as the poems written in the best period (1100-1260) of Provençal literature (q.v.). The Germans cultivated such forms as were popular in southern France, as the love poem proper, the

serventes (q.v.), and the *tenzon* (q.v.). Like the troubadour, the minnesinger sang the praises of his lady, who was often his patron's wife. Of her he made an earthly angel, and whatsoever boon she might grant him was his bliss. The minnesingers whose dialect puts them on the western boundary of Germany first show French influence. Provençal influence is earliest perceptible in Friedrich von Hausen, a Franconian from the Rhine. The dactylic rhythm bears witness also to a romantic origin. Minnesingers who used it were, besides Friedrich von Hausen, Heinrich von Veldeke, Heinrich von Morungen, Hartmann von Aue, Walther von der Vogelweide, Hildebold von Schwangau, and Ulrich von Liechtenstein.

With Friedrich von Hausen we first meet the Crusading song. Walther von der Vogelweide gave the fullest utterance to the minnesong. In him we find both courtly and popular elements. Walther also modeled poems after romantic patterns. Austria was the centre of court poetry. There Reinmar had lived and there Walther had learned his art. Neidhart had first composed for peasants songs and dances, but his ambitious tendencies displeased them and he turned to the court. With Walther and Neidhart the road goes in twain, and each had his followers. Princes had been among the troubadours. So it was in Germany, where Henry VI and Conradin were singing in the south, while farther north were Duke Henry II of Anhalt, Margrave Otho IV of Brandenburg, and Henry III of Meissen.

The most important manuscripts are the Weingarten, the small and the large Heidelberg collections. The last contains 7000 strophes from 140 poets.

Jahrhunderts* (Stuttgart, 1891-95), and K. F. Bartsch, *Deutsche Liederdichter des 12. bis 14. Jahrhunderts* (3d ed., ib., 1893).

MINNESOTA. One of the North Central States of the American Union. It lies around the headwaters of the Mississippi River, between lat. 43° 30' and 49° 25' N. and long. 89° 29' and 97° 5' W. It is bounded on the north by the Canadian provinces of Ontario and Manitoba, on the east by Lake Superior and the State of Wisconsin, on the south by Iowa, and on the west by the Dakotas. It has an extreme length north and south of about 400 miles, and east and west of 380 miles, but its average width is only 240 miles. It comprises an area of 84,682 square miles, of which 3324 square miles are water. It ranks tenth in size among the States.

Topography. Minnesota may be said to be divided into three areas which slightly overlap. First, the highland district, which is popularly known as the Height of Land, 1750 feet above sea level, which slopes off in all directions, thus forming the watershed for three great river systems—the Red, the St. Lawrence, and the Mississippi. These highlands include the famous Vermilion, Mesaba, and Cuyuna iron ranges, and are covered with dense forests of pine, hemlock, spruce, and other evergreens, which originally extended southward to within 25 miles of the twin cities, but were terminated on the west by the slope of the Red River valley. Second, the hardwood belt, which fringes the west edge of the evergreen district, but spreads out on the south border to a width of 50 miles, ending in what was called by the Sioux “the Big Woods,” a forest of immense maples, elms, oaks, and other varieties that the farmer has not wholly conquered after 50 years of constant cutting. The remainder of the State, including the fertile Red River valley, the counties on the upper Minnesota River, and those of the two southern tiers, is the prairie, treeless save only for the wooded slopes of the streams and the groves planted by the settlers, many of which, however, are now yielding crops of merchantable timber. In the southwest portion of this district the surface is broken by the coteaux des prairies, but these never attain any great height. The lowest parts of the State are the region around the head of Lake Superior and the southeastern section, where the land falls to a height of 600 feet; the very highest part is the Mesabi district, 2200 feet above sea level. The surface of the State shows the glacial action characteristic of the neighboring States, but has retained more of the moraine lakes, which are scattered thickly over the whole surface, whether forest or prairie land, to the total number of over 10,000.

Drainage. The three large river systems referred to provide an adequate drainage for the State, except in a limited area in the region of Red Lake, now drained artificially. The Mississippi receives as its chief tributaries the St. Croix, which makes the Minnesota-Wisconsin boundary line, and the Minnesota, besides innumerable smaller streams, before it leaves the State. Thus it drains over one-half the area. Although the Red River rises in Lake Traverse, less than 2 miles from the source of the Minnesota, and flows northward to Lake Winnipeg in Canada, it receives its chief supply from the west slope of the divide. Along the north boundary the Rainy River, fed by short streams from the Height of Land, finds its way to Lake of the Woods; and into Lake Superior pours the flood of the St. Louis River from the south slope of the divide. Although the Minnesota and Red rivers are reputed “navigable,” the Mississippi is the only one of these streams that is much used commercially, except for the power that many of them furnish.

In the south the lakes are often broad and shallow. Three-fourths of them occupy hollows left in the moraines, or deposits of the glacial age, which cover the greater portion of the State. Others, such as Lakes Pepin, Traverse, Big Stone, and Rainy, are river expansions. The lakes vary in size from mere ponds to Red Lake, the area of which is 340 square miles. The other more important bodies are Leech and Winnebigoishish in the plateau region, Mille Lac,

and Minnetonka, a popular summer resort for the twin cities. Rainy Lake, on the north border, which has been made accessible to tourists since 1900, is fast becoming the most famous of resorts. In the glacial period an immense lake 700 miles wide was formed in the valley of the Red River. At first it was drained by way of the Minnesota River into the Gulf of Mexico, but as the ice disappeared the lake was drained northward into the Nelson River, leaving a wonderfully rich plain, marked on its east border by successive beach lines. Upon this plain Minnesota farmers have raised great crops of wheat for over 30 years. This ancient basin is known as Lake Agassiz.

Climate. Minnesota lies in the middle of the north temperate zone and in the geographical centre of the continent. This gives it a climate which, although subject to great extremes, maintains an average temperature that makes certain the annual production of a great diversity of grasses, vegetables, and fruits. The average temperatures for January are 15° F. at the southeast corner and 1° F. at the northwest corner. For July it is 70° F. in the south and 65° F. in the north. The temperature has risen to 100° in the shade on occasions in the past 25 years, and on occasions it has fallen to 40° below zero. These extreme temperatures never last more than a day or two at a time. The annual rainfall ranges from 20 inches in the northwest to over 30 inches in the southeast. The rainfall is characterized by a scant precipitation in the winter season and moderately heavy rains during the crop season. There is an annual snowfall of 20 inches in the southwest and nearly 80 in the extreme north. The southern counties have an average relative humidity of less than 70 per cent; the northern counties 75 per cent. The prevailing wind is west in the northern half and southwest in the southern half. Nights are always cool, tempering the heat of summer, and the air is always dry, counteracting the cold of winter. Because of this evenness of summer, as well as for the many advantages that the State offers to those seeking recreation, Minnesota has always been a favorite summer resort. Every year great numbers of campers and excursionists scatter over the State.

Soils. The soils are wholly glacial, and since the outcropping stratified rock is largely limestone, most of the soil derived from this source is very rich—a fine black loam. On the older drift in the southeastern counties, for 30 or 40 miles back from the Mississippi River, there is a coating of loess, a loam of exceptional fertility. Where the Cambrian sandstone outcrops in the east-central part of the State, considerable areas are covered with a light, sandy soil that until recently seemed not at all encouraging for agriculture; but, with improved methods of tilling and with a better understanding of the chemistry of soils, these areas are being brought under cultivation. It is in this part of Minnesota that a great part of the potato crop, that reached a total of 15,000,000 bushels in 1914, is produced. In the old land of the northeast and north-central districts there are areas almost denuded of soil, or covered with a scanty coating of granite drift. In 1914 the people voted to give the forestry board the power to reforest this land and so cause it to produce once more the pine that it has in the past abundantly borne, the only crop that it will

bear. In the valley of the Red River the silts of old Lake Agassiz occur. On this is raised the immense wheat crop that annually brings to Minnesota great wealth from all parts of the world. Finally, in the Red Lake region there are swamps, once believed to be waste land.

By drainage, however, this land is being opened to cultivation.

In time it will be likely to rival the other soils of the State in productiveness. The formation is of peat, decayed vegetable matter, underlain by clay.

Geology. The northwest corner of the State is Archean, and its east-central portion was once occupied by a large island. These areas now consist of granites and gneisses, which also have been uncovered in the upper valley of the Minnesota River, where there are valuable granite quarries. Shore deposits and lava flows of the earliest age of the Huronian period outcrop in the old lands, cutting into the latter in deep tongues and bands, some of which contain iron-bearing beds of great wealth. The broad Huronian belt, extending southwestward from the Minnesota River, contains the Sioux quartzite, a most beautiful and valuable building stone, and beds of ancient red mud, changed by heat into the far-famed red pipestone of the Indians. The Lake Superior slope is underlain by what is known as Cambrian sandstone, or that formed during the first age of the third period; and the Ordovician rocks, the creation of which immediately followed the Cambrian, occur in the southeastern part of the State. These rocks, referred to as St. Peter sandstone and Trenton limestone, make a combination that has given rise to the bluffs along this part of the Mississippi and to the Falls of St. Anthony. Silurian rocks occur in the valley of the Red River and in some of the southeastern counties, and slight deposits of the Cretaceous are found in various parts of the State. In the Pleistocene came the great ice invasion that, in three successive waves, swept over the northern part of the United States and is most largely responsible for the present surface. The State was almost entirely covered by ice by the first two of these waves, but in the third epoch two great lines of ice met at the centre of the State and flowed southward in a tongue to Iowa.

Mining. The importance of Minnesota as a mineral producer, ranking ninth among the States, comes almost entirely from its iron mines. In its output of iron ore Minnesota far outranks all the other States and contributes both in quantity and value considerably more than half of the iron ore produced and marketed in the United States. By far the largest part of the production is from the Mesabi Range, now the most important iron-producing district in the world. It lies entirely within Minnesota and is the youngest of the great iron-ranges. It was opened in 1892 with a production in that year of less than 30,000 tons; in 1894 it produced nearly 2,000,000 tons, in 1902 over 13,000,000 tons, or nearly one-half of the total output of Lake Superior iron ore, and reached its highest producing point in 1913 with 36,378,671 long tons. The Vermilion Range, of the older producing districts, is also entirely within the State, but its production in 1913 (1,536,115 tons) was not quite 5 per cent of the output of the Mesabi Range. Its maximum production was attained in 1902—a total of 2,057,273 tons. The iron-ore production is primarily the output

of St. Louis County, whose production approximates 75 per cent of the total output. The iron ore produced in 1913 was 38,658,793 long tons. The production marketed in 1913 was valued at \$80,789,025.

Exclusive of iron ore, the value of the mineral products in 1913 was \$5,025,508. Of these less important industries the principal products were from the quarries and clay pits, and these were almost equal in value. In 1913 the clay products, exclusive of pottery, were valued at \$1,781,017 and the stone products at \$1,952,686. The chief quarry products are granite, limestone, and sandstone, while the principal clay product is common brick, with smaller quantities of sewer pipe, fireproofing, front brick, drain tile, pottery, etc. The other commercial products are cement, feldspar, occasional gems, lime, mineral waters, sand and gravel, and sand-lime brick. The total value of the mineral products in 1913 was \$85,814,533.

Agriculture. Over one-half of the entire land area is in farms, the proportion of farm land showing a gradual increase from the northern to the southern part of the State. Of an approximate land area of 51,749,120 acres, in 1910, 27,675,823 acres were in farms, of which there numbered 156,137. The improved land in farms amounted to 19,643,533 acres. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was in 1910, \$1,476,411,737. Of the total number of farms in 1910, 79 per cent were operated by owners and managers. The percentage operated by tenants is, however, steadily increasing, having been in 1880, 9.1 per cent, in 1890, 12.9 per cent, in 1900, 17.3 per cent, and in 1910, 21 per cent. In 1910 more than 70 per cent of the farms in Minnesota were at least 100 acres in size.

The native white farmers in 1910 numbered 74,710 and the foreign-born white farmers 81,134. Negro and other nonwhite farmers numbered 293. It will be noted that Minnesota is one of the few States in which the foreign-born white farmers outnumber the native white. Of the foreign-born farmers, 22,011 were born in Germany.

The following table shows the acreage, production, and value of important crops as estimated by the United States Department of Agriculture in 1914. The total value of crops

PRODUCTS	Acreage	Prod. bu.	Value
Corn.....	2,600,000	91,000,000	\$47,320,000
Wheat.....	4,050,000	42,975,000	43,834,000
Oats.....	3,040,000	85,120,000	34,048,000
Barley.....	1,378,000	31,694,000	16,798,000
Rye.....	279,000	5,245,000	4,668,000
Flax.....	270,000	30,780,000	9,850,000
Potatoes.....	1,743,000	*3,294,000	20,093,000
Hay.....	315,000	2,930,000	3,750,000
Flaxseed.....			

* Tons.

in 1909 was \$193,451,000, and the combined acreage was 14,731,464, representing 75 per cent of the total improved land in farms. The general character of agriculture is indicated by the fact that about three-fourths of the total value of crops in 1909 was contributed by the cereals and about one-eighth by hay and forage. The remainder, representing 13.4 per cent of the total value, consisted mostly of potatoes and other vegetables and of forest products. The

production of wheat in 1909 amounted to 57,094,412 bushels, valued at \$56,007,435. The acreage devoted to this crop was 3,276,911. Oats, the second important crop, had an acreage of 2,977,258 in 1909, the production amounting to 93,897,717 bushels, valued at \$34,023,389. Corn and hay and forage came next, with productions of 67,897,051 bushels and 6,036,747 tons, valued at \$30,510,145 and \$26,724,801 respectively. The acreage was 2,004,068 and 3,946,072 respectively.

The total acreage of potatoes and other vegetables in 1909 was 269,713 and their value was \$11,044,391. Excluding potatoes, the acreage of vegetables was 46,021 and their value \$3,359,000.

The soils in several portions are admirably adapted to the growing of apples, and these are the most important of the orchard fruits produced. There were grown, in 1909, 1,044,156 bushels, valued at \$769,114. Orchard fruits next in importance were plums and prunes. The total value of orchard fruits in the year named was \$801,112. In addition to this there were grown 293,805 pounds of grapes, valued at \$11,021. The most important of the small fruits is the strawberry, of which 2,730,099 quarts, valued at \$268,772, were grown in 1909. The growing of sugar beets is an industry of some importance. There were devoted to this product, in 1909, 2238 acres, and the product was 24,140 tons, valued at \$118,625.

Live Stock and Dairy Products. The total value of live stock on the farms in 1910 was \$156,771,855. The cattle on the farms on Jan. 1, 1915, according to the estimates of the United States Department of Agriculture were as follows: cattle other than milch cows, 1,208,000, valued at \$29,838,000; milch cows, 1,186,000, valued at \$63,451,000; horses, 872,000, valued at \$101,152,000; sheep, 564,000, valued at \$2,594,000; swine, 1,716,000, valued at \$21,450,000; mules, 6000, valued at \$744,000. The total value of milk, cream, and butter fat sold and butter and cheese made in 1909 was \$29,219,406. The milk sold amounted to 53,181,785 gallons, valued at \$6,146,512. Butter made amounted to 34,708,669 pounds, valued at \$8,593,233. The number of all fowls on the farms in 1910 was 10,697,000, valued at \$4,646,960.

Fisheries. In 1908 there were 934 persons engaged in fisheries, the capital invested was \$129,000, and the value of products, \$192,000. The products present a large variety, but lake herring, German carp, buffalo fish, and catfish are the principal species caught.

Forest Products. The production of rough lumber (in which it ranked twelfth among the States) in 1909 was 1,561,508 M feet B. M. The production of lath was 478,008 M in 1909, and that of shingles, 74,818 M. Of the total output of lumber very nearly five-sixths was white pine, Minnesota supplying slightly more than one-third of the total quantity of this variety of lumber produced in continental United States in 1909. The most important of the other varieties of lumber cut were spruce, tamarack, and hemlock. Minnesota is the leading State in the production of lath, with 12.9 per cent of the total for the United States in 1909. In addition to the foregoing, there were produced on the farms in 1909 forest products valued at \$5,181,508.

Manufactures. Minnesota is of less importance as a manufacturing than as an agricultural

State. Its large mineral output contributes little to its manufactures, as most of the products are shipped out of the State, but its extensive forests and large wheat fields furnish raw material for the two most important industries. The value of manufactured products per capita in 1909 was \$197. In that year Minnesota ranked thirteenth among the States in the gross value of products.

The table on page 749 gives the most important figures relative to manufactures in 1909 and 1904.

Minnesota is the leading State in the Union in the value of the products of flour and grist mills, contributing 15.7 per cent of the total in 1909. Its importance in this industry is due to its large production of wheat, to its advantageous geographic location, particularly with respect to the adjoining grain-growing States, and to the excellent and modern facilities afforded for handling grain both by rail and by water. In both 1904 and 1909 Minnesota ranked first in the quantity and value of its wheat-flour products milled, third in respect to its barley and oat products, and fourth in respect to its rye products. In 1909 there were produced 22,712,534 barrels of white flour, or more than one-fifth of the total output of this cereal product in the United States. Second in value of products are the industries connected with the manufacture of lumber and timber. In addition to the logging plants, these include saw mills, planing mills, and wooden packing box factories. For further statistics in regard to this industry, see *Forest Products*, above. Pork is the most important product of the meat and slaughtering industry, while butter forms the chief output of the dairies. (See *Live Stock and Dairy Products*, above.) Radical changes in the methods of agriculture and the rotation of flax with other crops have made it more profitable to raise flax, thereby stimulating the manufacture of linseed oil. The growth of this industry has been remarkable, for while in 1899 there were only three establishments manufacturing this oil and its output was valued at only \$1,548,000, the output in 1909 was valued at \$11,037,000. In the manufacture of malt liquors the State takes high rank. Other important industries not shown separately in the table are those engaged in the manufacture of belting and hose, leather, iron and steel, millinery and lace goods, pottery and fire-clay products, and steam packing.

The total number of wage earners in 1909 was 84,767, of whom 73,259 were males. For the great majority of wage earners the usual hours of labor ranged from 54 to 60 a week, only 16.7 per cent of the total being employed in establishments where the hours were less than 54 and only 4.1 per cent in establishments where they exceeded 60 a week.

In 1909 the eight cities of over 10,000 population produced 64 per cent of the total value of manufactured products and had 66.9 per cent of the average number of wage earners. The most important manufacturing city is Minneapolis (q.v.), which had, in 1909, 26,962 wage earners and manufactured products valued at \$165,404,680. The most important industries of the city are those connected with the manufacture of flour. St. Paul (q.v.) is the second city in value of manufactures. There were here, in 1909, 19,339 wage earners, and the value of its manufactured products was \$58,990,025.

Transportation. The State has very favorable facilities for both water and rail transportation. St. Paul and Minneapolis form one of the most important centres for transcontinental railway traffic, while Duluth, at the west end of Lake Superior, has larger shipments by water than any other city on the Great Lakes, and ranks as one of the important ports of the United States. Transportation on the Mississippi River was formerly very important, but has decreased on account of the development of the railroads. On the St. Lawrence system, however, it has greatly increased. The availability of lake transportation has been one of the greatest factors in the development of the

State courts and by the United States Supreme Court. For a discussion of these matters, see RAILWAY.

Banks. The first banking law of Minnesota was passed in 1858, at the first session of the Legislature; the law was amended in 1878, placing the banks under the control of the Public Examiner, who is ex-officio superintendent of banks. The law was amended and made more stringent in 1881, 1889, and 1895. Banking business in the State was unprofitable at first and all the State banks organized in 1858-68 were discontinued. In 1878 there were 17 and, in 1898, 161 banks in operation. Savings banks are regulated by the Law of 1879, which placed

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)

mining industry. The southern and western parts of the State are well supplied with railroads. The total mileage of main line in 1914 was 9002. The most important lines and their total mileages are: the Great Northern, 2100; the Chicago, Milwaukee, and St. Paul, 1230; the Northern Pacific, 1039; the Chicago and Northwestern, 650; the Chicago, St. Paul, Minneapolis, and Omaha (Chicago and Northwestern), 431; the Chicago Great Western, 399; the Minneapolis and St. Louis, 378; the Duluth, Messabe, and Northern, 363; the Duluth and Iron Range, 291; the Chicago, Rock Island, and Pacific, 236; and the Chicago, Burlington, and Quincy, 24. The State has a railroad and warehouse commission, which hears and passes judgment upon complaints. The efforts of this commission to regulate railroad rates on interstate railroads resulted in several important decisions in regard to railroad rates by the

them under the jurisdiction of the Bank Commissioner. On Sept. 12, 1914, there were 274 national banks, with an aggregate capital of \$26,121,000; surplus, \$16,373,455; cash, etc., \$6,491,927; loans, \$214,532,714; and deposits, \$218,559,741. On June 30, 1914, there were 818 State banks, with capital of \$16,024,878; surplus, \$5,153,878; cash, \$5,709,005; loans, \$135,990,834; and deposits, \$146,899,883.

Government. The present constitution was adopted on Oct. 13, 1857, and succeeded the organic Act providing for a territorial form of government passed on March 3, 1849. Amendments to the constitution may be made by a majority of both Houses of the Legislature, becoming a part of the constitution when approved by a majority vote of the people. A convention to revise the constitution may be called whenever two-thirds of the members of each branch of the Legislature think it necessary and the

proposition shall have been favorably voted upon by the electors.

Legislative.—The Legislature consists of a Senate and a House of Representatives, which meet biennially. No session must exceed 90 legislative days. The number of members who compose the Senate and the House of Representatives is prescribed by law, but the members of the Senate shall never exceed one member for every 5000 inhabitants, and in the House of Representatives one member for every 2000 inhabitants. The House of Representatives has the sole power of impeachment. Representatives hold office for two years and Senators for four years.

Executive.—The executive power consists of a Governor, Lieutenant Governor, Secretary of State, Auditor, Treasurer, and Attorney-General. The term of the Governor and Lieutenant Governor is two years. Each must have attained the age of 25 years and have been a resident of the State for one year next preceding his election. The term of the Secretary of State, State Treasurer, and Attorney-General is two years. The term of the State Auditor is four years. The Lieutenant Governor is ex-officio president of the Senate.

Judiciary.—The judicial powers are vested in a supreme court, district courts, courts of probate, justices of the peace, and such other courts, inferior to the supreme court, as the Legislature may from time to time establish by a two-thirds vote. The supreme court consists of one Chief Justice and four associate justices, elected for a term of six years, and two commissioners appointed by the court. The State is divided into judicial districts, which are composed of contiguous territory. In each district one or more judges, as the Legislature may prescribe, are elected for a term of six years. There is a probate court in each organized county, and its judge is elected for a term of two years. Justices of the peace are elected in each county for two years.

Suffrage and Elections.—Every male person of the age of 21 years and upward who is a citizen of the United States and who has resided in the State six months next preceding any election is entitled to vote. This includes mixed and pure Indians who have adopted the customs and habits of civilization. Women may vote for school officers and members of library boards, and are eligible to hold any office pertaining to the management of schools or libraries. General elections are held biennially, on the first Tuesday after the first Monday in November, dating from 1884. In accordance with the amended election laws of 1912, a State-wide primary is held on the Tuesday seven weeks preceding any election, for the selection of party and other candidates for all elective State offices and those of cities of the first and second class. There are nonpartisan primary ballots for the judiciary and other offices. Candidates for office are chosen at primary election by voters of the several political parties and not otherwise. Candidates are limited in the character of personal expenditures incurred in connection with their campaigns, and the total of all expenses must not be above limits specified for the various offices. All campaign literature must bear the name of its author, and the inducing of persons to become or not to become candidates for office is prohibited. Wagering on elections is a violation of the law. Candidates

must make itemized statement of all disbursements. Corporations are prohibited from making political contributions. The Legislature of 1911 passed an Act providing for the direct nomination of United States Senators. By a law passed in 1912, Minneapolis, St. Paul, and Duluth are required to have nonpartisan primaries for municipal officers. The Legislature of 1913 enacted a measure providing for presidential primaries, and the nonpartisan primary was extended to members of the Legislature.

Local and Municipal Government.—The Legislature may from time to time establish and organize new counties; but no new county shall contain less than 400 square miles, nor shall any county be reduced below that amount. The Legislature may organize any city into a separate county, when it has attained a population of 20,000 inhabitants, without reference to geographical extent, when a majority of the electors of the county in which such city is situated shall be in favor of a separate organization. Cities and towns have the power to adopt a home-rule charter. Cities of the first class with home-rule charters may regulate the sale of liquor in hotels.

Miscellaneous Constitutional and Statutory Provisions.—No corporation may be formed under special acts except for municipal purposes. Married women retain the same legal existence and personality as before marriage, may sue or be sued, and, with the exception of voting, receive equal protection of all their rights. Combinations to monopolize the markets for food products, or restrict the freedom of such markets, are criminal conspiracies. The sale of cigarettes in the State is forbidden. There are restrictions in the character of employment of children. The maximum hours of employment for children are 8 per day and 48 per week; for women, 10 hours per day and 58 per week for certain occupations and 9 hours per day and 54 per week for others. County boards are authorized to appropriate money to prevent the spread of tuberculosis. Five-sixths of a jury may return a verdict in civil cases after 12 hours' deliberation. There is a "blue-sky" law relating to insurance companies only. The Legislature of 1913 passed a workmen's compensation act and created a minimum-wage commission to regulate the wages of women and minors. The Legislature of 1913 also enacted a measure providing for mothers' pensions in the State. Minnesota is under local-option law.

Finance. By the constitution of 1857 the State was prohibited from incurring debts for public improvements above \$250,000. An amendment adopted in 1858, however, permitted the issuing of \$5,000,000 of 7 per cent bonds to lend to the railroads under guaranty of first-mortgage bonds. Less than half of these bonds were sold, the railroads defaulted the interest on their mortgage bonds, and the State acquired their property by foreclosure. The State was unable to meet the interest payment, and in 1860 the debt on these bonds was repudiated. In 1881 the obligations were resumed, when the old bonds were exchanged for new ones at the rate of 50 per cent. This gave the State a debt of \$4,253,000, which was gradually reduced. In 1912 it amounted to \$900,000. This consists entirely of certificates of indebtedness, held largely by the school fund. The floating debt in 1912 consisted of outstanding warrants

amounting to \$445,290. The funds and investments in 1912 amounted to \$30,265,400. The per capita debt in that year was 63 cents. The total receipts from all sources for the fiscal year ending July 31, 1914, amounted to \$22,680,208. The disbursements for the same period amounted to \$20,714,746. There was a balance at the beginning of the year of \$1,842,367 and at the end of the year of \$3,807,830. The chief sources of revenue are railroad taxes, general taxes, the twine plant at the State prison, and permanent trust funds.

Militia. In 1910 the males of militia age, between 18 and 44 years, numbered 491,113. The organized militia consisted, in 1914, of three regiments of infantry and one of field artillery. There were 217 officers and 2706 enlisted men.

Population. In 1910 Minnesota ranked nineteenth in population among the States. The population by decades since its organization as a Territory is as follows: 1850, 6077; 1860, 172,023; 1870, 439,706; 1880, 780,773; 1890, 1,310,285; 1900, 1,751,394; 1910, 2,075,708. The est. pop. on July 1, 1914, was 2,213,919; 1920, 2,387,125. In 1910 the population per square mile was 25.7. The urban population in places of 2500 or over was 850,294 in 1910. The native white population numbered 578,081; the foreign-born white, 543,010; and the negro, 7084. There were also 9053 of Indian parentage. Of the foreign-born white those of Swedish, German, and Norwegian origin predominated, in the order named. These three nationalities contributed about 62 per cent of the total foreign-born population, which was about equally divided among them. By sex the population was divided into 1,105,511 males and 967,197 females. Males of voting age numbered 642,069.

There were but eight cities in 1910 that had populations of 10,000 or over. These, with their populations in 1910 and as estimated in 1914, are: Minneapolis, 301,480 and 343,466; St. Paul, 214,744 and 236,766; Duluth, 78,460 and 89,331; St. Cloud, 10,600 and 11,425; Virginia, 10,473 and 13,671; Mankato, 10,365; Stillwater, 10,108; Winona, 18,583. (There were no estimates for 1914 for the last three cities named.)

Education. The high standards of education in Minnesota are reflected in the relatively small portion of illiterates. In 1910 there were 49,336 persons of 10 years of age or more who were illiterate, a proportion of 3 per cent of the entire population. Among the whites of native parentage the percentage was four-tenths of 1 per cent and among foreign-born whites 7.6 per cent. The school population, ages 6 to 20 years, in 1910 was 648,775; of this number 443,761 attended school. According to the report of the State Superintendent of Education the total enrollment in public schools in 1914 was 457,041; the total number of teachers was 16,920, of whom 7966 were in high and graded districts and 8954 in rural districts. The average monthly salary of men teachers in rural districts was \$58 and of women teachers \$49. The total disbursements for educational purposes in public schools in 1914 was \$19,396,782. The State gives special aid to schools which maintain training and agricultural departments, and to high and graded schools, consolidated schools, and rural schools. There were, in 1914, 26 vocation training schools, in which were enrolled 2927 pupils. The Legislature of 1913 enacted a law which requires definite training

of all persons who enter upon teaching in the public schools.

The Legislature of 1911 enacted a compulsory education law which is unusually comprehensive. The same Legislature passed a law regulating prices of textbooks, which, on the vote of the district or of the school board, may be supplied free or sold at cost.

Normal schools are maintained at Winona, Mankato, St. Cloud, Moorhead, and Duluth. The total enrollment in these schools in 1914 was 4166. The University of Minnesota, which is part of the educational system of the State, is at Minneapolis. Other institutions of collegiate rank are Carleton College and St. Olaf College at Northfield, Hamline University at St. Paul, Macalester College at St. Paul, and Gustavus Adolphus College at St. Peter. These are all coeducational. Albert Lea College at Albert Lea is the only women's college. St. John's University (Roman Catholic), at Collegeville, and Augsburg Seminary, at Minneapolis, are colleges for men only.

Charities and Corrections. The charitable and correctional institutions are in the hands of the State Board of Control, created in 1901. It consists of three members appointed by the Governor and Senate for the term of six years, and has full power to manage and control the State charitable and penal institutions, with authority in financial matters in certain State schools, including those for the deaf and blind. The State institutions include asylums for the insane at Anoka, Hastings, Fergus Falls, Rochester, and St. Peter; the Institution for Feeble-Minded and Epileptic, the Institution for the Blind, and the Institution for the Deaf at Faribault; the State Public School at Owatonna; Training School for Boys at Red Wing; Training School for Girls at Sauk Centre; the State Reformatory at St. Cloud; the Penitentiary at Stillwater; the State Sanatorium, for tuberculosis, at Walker; the Inebriate Hospital at Willmar; the State Hospital for Crippled and Deformed Children at St. Paul. The total number of inmates at these institutions on July 31, 1913, was 9212. The expenditure for their maintenance was \$1,860,484. A new State prison at Stillwater was erected in 1913-14. The chief industry at the prison is the manufacture of twine. The product in 1913 was 18,000,000 pounds, and the profit was \$372,354. Since the twine system was established the profits have aggregated \$2,158,601. The manufacture of farm machinery has also been carried on successfully in the prison. The State hospital for the care of inebriates and persons addicted to the drug habit was opened in December, 1912. The Legislature in 1911 provided for the indeterminate sentence of prisoners convicted of any crime except treason and murder, and for a State board of parole. Life imprisonment was substituted for death as a punishment for murder in the first degree.

Religion. The noteworthy characteristic of the religious situation in Minnesota is the great predominance of the Roman Catholic and the Lutheran churches. The strongest of the other denominations represented are the Methodists, Baptists, Presbyterians, Congregationalists, and Protestant Episcopalians.

History. Radisson and Groseilliers, Frenchmen, visited, probably in 1660, what is now Minnesota. About 1678 Daniel Du Luth built a fort at the mouth of the Pigeon River, on the north

shore of Lake Superior. In 1680 the Falls of St. Anthony were discovered by Louis Hennepin, a Franciscan priest. Before 1700 there were trading posts on Lake Pepin and on the Minnesota River. A part of Minnesota was included in the extensive territory ceded by France to Great Britain in 1763. In 1766 it was explored by Capt. Jonathan Carver, of Connecticut. In 1783 it became a possession of the United States. The part of the State east of the Mississippi belonged at different periods to the Territories of Indiana, Michigan, and Wisconsin, Northwest Territory, and Illinois Territory. The region west formed part of the Territories of Missouri (earlier District of Louisiana), Michigan, Wisconsin, and Iowa. The government in 1805 bargained with the Indians for tracts of land at the mouths of the St. Croix and Minnesota as sites for military posts. The exploring expedition of Lieutenant Pike in 1805 was followed by many others within the succeeding 40 years; and with an increased knowledge of the country came the first important beginning of immigration. Fort St. Anthony (Snelling) was built in 1819-21; in 1822 a clearing was made at the Falls of St. Anthony and a mill was built, and in 1823 the first steamboat ascended to the falls. The next settlements made were by a colony of Swiss, near Fort Snelling in 1827, and at Stillwater in 1843. Two years before this latter date Father Galtier had erected a log chapel a little southeast of the Falls of St. Anthony and dedicated it to St. Paul. This was the nucleus of the present city of that name. The Indian titles to the lands east of the Mississippi were not extinguished until the year 1838, and it was not until March 3, 1849, that the Territory of Minnesota was organized, with the Missouri River as its west boundary. In 1851 the Indian titles to the lands (except reservations) between the Mississippi and the Red River of the North were extinguished and immigration increased rapidly. On May 11, 1858, Minnesota was admitted as a State. The educational institutions for which the State is noted took their rise early in the history of the Territory. Hamline University, at St. Paul, was founded in 1854, and St. John's University, at Collegeville, was established three years later. In 1862 the Sioux Indians, under Little Crow, dissatisfied with the settlers' treatment of them, attacked and destroyed many of the frontier settlements. Over 500 white settlers and soldiers were killed and 25,000 people were driven from their homes. The Indians were decisively defeated at Wood Lake on Sept. 22, 1862, and after engaging in sporadic raids in 1863 were removed west of the Missouri. In spite of the horrors of Indian war, immigration continued undiminished; it was stimulated by the activity of immigration agents in the Eastern States and Europe, and was encouraged by the enactment of liberal homestead laws. From the sale of its extensive public lands the State obtained a very large school fund, which it employed in building up an admirable school system.

Minnesota was consistently Republican in State politics from 1860 to 1898, when the Democrats, Populists, and Silver Republicans defeated the Republicans and elected their candidate for Governor. The Republicans regained power in 1901 and held it until 1905, when the personal popularity of the Democratic candidate, John A. Johnson, secured his election. The Republicans, however, controlled the other State offices. Governor Johnson was reelected for

three successive terms. In 1908 he had become so prominent a national figure that he was one of the leading candidates for the Democratic presidential nomination and the delegates from Minnesota were instructed to vote for him in the National Convention.

In the presidential election of 1908 Taft carried the State with 155,416 votes compared with 109,504 for Bryan. Governor Johnson was reelected, but died on Sept. 20, 1909, and was thereupon succeeded by Lieutenant Governor Eberhart, a Republican. Governor Eberhart was elected in 1910. In 1911 Moses E. Clapp was reelected United States Senator.

A new primary law providing for the nomination of State officers and delegates for the National Convention went into effect in 1912. The Progressive party developed great strength in that year, and in the presidential election Roosevelt received 125,856 votes compared with 106,426 for Wilson and 64,644 for Taft.

In 1914 the Democrats regained power, electing W. S. Hammond Governor with 156,304 votes compared with 143,730 for W. E. Lee, Republican. The Progressive vote fell from 128,856 in 1912 to 3553 in 1914. The State has 12 votes in the Electoral College. The capital is St. Paul.

The following is a list of Governors of Minnesota since its organization as a territory:

MINNESOTA, UNIVERSITY OF. A coeducational State institution of higher learning in Minneapolis, Minn., established by an Act of the Territorial Legislature in 1851 and confirmed by the State constitution adopted in 1857. The present charter was adopted in 1868, and the first collegiate work was begun in the following

year. Its government is vested, since the death in 1901 of the life regent, John S. Pillsbury, in a board of 12 regents, nine appointed by the Governor of the State and holding office for six years, and three ex-officio members—the Governor, the State Superintendent of Public Instruction, and the president of the university. The university comprises the following colleges, schools, and departments: 1. The Graduate School, with advanced courses in all branches. 2. The College of Science, Literature, and the Arts, offering four-year courses, largely elective, leading to the degree of bachelor of arts, courses in which the senior work is offered conjointly with the Schools of Law, Medicine, Dentistry, and Chemistry, leading to the same degree; a four-year course in arts and music, leading to the degree of bachelor of arts and music; also a four-year course in science and medicine, leading to the degree of bachelor of science. 3. The College of Engineering and the Mechanic Arts, offering five-year courses in civil, mechanical, electrical, and architectural engineering and architecture, leading to the degrees of civil, mechanical, electrical, and architectural engineer and architect. The degrees of bachelor of science in engineering and in architecture are conferred at the end of the fourth year. 4. The Department of Agriculture, embracing (a) the Colleges of Agriculture and Forestry, offering four-year courses, leading to the degrees of bachelor of science in agriculture, in home economics, and in forestry; (b) the Schools of Agriculture, offering three-year courses adapted especially to the needs and opportunities of farm boys and girls; (c) short courses in dairying, farm management, and traction engineering; (d) the experiment stations, offering research advantages; (e) extension work in agriculture. 5. The Law School, giving a three-year course, leading to the degree of bachelor of laws. 6. The Medical School, with a five-year course, including one year of hospital internship, leading to the degree of doctor of medicine. 7. The College of Dentistry, with a three-year course, leading to the degree of doctor of dental surgery. 8. The College of Pharmacy, offering a two and a three year course, leading to the degrees of graduate in pharmacy and pharmaceutical chemist respectively. 9. The School of Mines, offering three five-year courses, leading to the degrees of engineer of mines, engineer of mines in geology, and metallurgical engineer. 10. The School of Analytical and Applied Chemistry, with two five-year courses, the Applied Course leading to the degree of chemical engineer, the other, offered conjointly with the College of Science, Literature, and the Arts, leading to the degrees of bachelor of arts and bachelor of science in chemistry; and a four-year course in analytical chemistry, leading to the degree of bachelor of science in chemistry. 11. The College of Education for the training of teachers and supervisors, with a two-year course, leading to the degree of bachelor of arts in education. 12. The University Extension Service, offering educational opportunities to the people of the State through (a) correspondence courses, (b) evening classes, (c) lecture courses, (d) field debates on public questions, (e) a reference bureau. The university also has charge of the geological and natural history survey. The degrees conferred for graduate work are the master's degree in arts, science, and pharmacy, and the doctor's degree in philosophy and medicine. No honor-

ary degrees are conferred. The departments of law, medicine, and education require two years of collegiate preparation. In all other departments students are admitted on examination or on certificate from accredited schools of the State. Tuition ranges from \$30 to \$150 a year. In 1913-14 the faculty numbered 608 and the attendance was \$992, of whom 3529 were women. Of this number 4155 were of college grade, 3209 subcollegiate, and 1628 extension. The general library contained 175,000 volumes, and there were special libraries in connection with the various departments of instruction. The laboratories are extensive and well equipped. There is an herbarium with 400,000 specimens. There are dormitories for the School of Agriculture, and one dormitory accommodating 90 women on the main campus. The main university grounds comprise about 109 acres, valued at \$2,000,000. The 32 buildings are valued at \$3,463,000, and their equipment at about \$1,805,000. The State experimental farm, located between Minneapolis and St. Paul, consists of about 420 acres, and is valued at \$413,000. The buildings and equipment of the Department of Agriculture are estimated at \$1,480,000. The university is supported by the income of its permanent endowment, a State tax of $\frac{3}{100}$ mill, and special legislative appropriations for support, buildings, and equipment. The gross income for 1913-14, exclusive of special appropriations, was \$2,445,491. The endowment was \$1,605,356.62, and the value of all the university property, \$12,112,000. George Edgar Vincent has been president since April, 1911. Consult E. E. Slosson, *Great American Universities* (New York, 1910).

MINNESOTA RIVER. An affluent of the upper Mississippi (Map: Minnesota, D 6). It rises on the east slope of the Dakota foothills (Coteau des Prairies) in the northeastern part of Marshall Co., S. Dak., at an elevation of about 1896 feet above sea level. It flows southeastward to the State line, where it enters Bigstone Lake, which is 26 miles long, from 1 to $1\frac{1}{2}$ miles wide, and shallow. This upper reach of the river often runs dry. The river leaves the lake at Ortonville and flows southeast to Mankato (225 miles), where it turns abruptly and thereafter flows northeast to its junction with the Mississippi, a few miles below the Falls of St. Anthony and between the cities of Minneapolis and St. Paul. Its total length is about 470 miles, and its drainage basin of 16,600 square miles extends nearly across the southern part of the State. It is by far the largest confluent of the Mississippi in Minnesota. Its chief tributaries are Pomme de Terre and Chippewa rivers from the north, and Lac qui Parle, Redwood, Cottonwood, and Blue Earth rivers from the south. It is navigable for steamers 45 miles, and at high water small vessels can ascend it 295 miles, beyond which it is obstructed by falls and rapids.

MINNEWAUKON, min'né-wā'kōn, LAKE. The largest lake in North Dakota, more frequently known as DEVIL'S LAKE (Map: North Dakota, G 1). It is situated in the northeastern part of the State and is 40 miles long and from 2 to 12 miles broad.

MINNEWIT, PETER. See MINUIT, PETER.

MINNOW (ME. *menow*, from AS. *myne*, minnow, probably from AS. *min*, Icel. *minnr*, Goth. *minniza*, OHG. *minniro*, Ger. *minder*, Lat. *minor*, less, Gk. *μῆνυθες*, *minynthein*, to lessen, Skt. *mī*, to diminish). The name popularly ap-

plied to almost any small fish. More technically it applies to members of the family Cyprinidae, which includes the roach, dace, carp, etc.; specifically, in England, *Leuciscus phoxinus*. This is a small fish about 3 inches long; abundant in gravelly bottomed streams. It is, of course, unimportant as food except for larger fishes. In the United States the name usually belongs to various small cyprinodonts, mainly of the large genus *Notropis*, living in the lesser streams and frequently called shiners. The largest and best known of these is the golden shiner (*Notropis hudsonius*), which has a very small head, but is sometimes a foot in length. (See DACE.) These fishes are mostly bottom feeders, are oviparous, carnivorous, and devour much spawn of their own and other kinds of fishes. The top minnows are of a different group, being killifishes (q.v.) of the genus *Gambusia*, and take their name from their surface-feeding habits. Along the eastern and southern coasts the common minnow of brackish water is the mummichog (q.v.). Consult D. S. Jordan, *Fishes* (New York, 1908), and id., *Manual of the Vertebrates of the Northern United States* (11th ed., rev. and enlarged, Chicago, 1914). See Plates of CARPS and THEIR EUROPEAN ALLIES; DACE and MINNOWS; KILLIFISHES and TOP MINNOWS.

MIÑO, or in Portuguese **MINHO**, mē'nyô (Lat. *Minius*). The principal river of Galicia, in northwest Spain (Map: Spain, B 1). It rises in the mountains of the Province of Lugo and flows in a southerly and southwesterly direction, forming a part of the boundary between Spain and Portugal, until it enters the Atlantic through a wide estuary. Its total length is 211 miles, for the last 25 of which it is navigable for small vessels, but it is much obstructed by reefs, islands, and shifting sand banks. Its banks are very fertile, and salmon and lamprey abound, yielding a considerable industry.

MINO'AN CIVILIZATION. See ARCHÆOLOGY, II, *Minoan, or Ægean, Period*; CNOSUS; CRETE; EVANS, SIR ARTHUR; GOURNIA.

MINO DA FIESOLE, mē'nô dâ fyă'zô-lâ (1431-84). A Florentine sculptor of the early Renaissance. He was born at Poppi in the Casentino valley. While employed as a stonemason at Florence he became the friend and pupil of Desiderio da Settignano. His home was at Florence, but there is documentary evidence to show that he was employed at Rome in 1454, 1463, and 1464. In 1473 he was working upon the monument to Pope Paul II, of which there are fragments in the Grotte Vaticane, under St. Peter's Church, and from 1475 to 1480 he executed various commissions under Sixtus IV. He died at Florence, July 11, 1484. His work possesses great charm and delicate finish, but is lacking in originality. Its high reputation is due to rich decoration and to a certain naïveté of expression, especially in his numerous portrait busts, which were executed under the influence of Desiderio da Settignano and are his best work. Besides these his chief works are monuments, altars, and tabernacles in the churches of Florence, Fiesole, and Rome. His most important achievements in Florence are in the church of La Badia: the monuments of Bernardo Giugni (1466) and the Margrave Hugo of Tuscany (1481). There are several tabernacles by him in Santa Croce, and in the Museo Nazionale are busts of Piero de' Medici (1453), Giuliano de' Medici, and Rinaldo della Luna (1461). One of his best works, if not his most

important, belongs to his early period: the monument of Leonardo Salutate, Bishop of Fiesole (died 1466), in the cathedral of that city; it is surmounted by a fine bust. The altar in the cathedral, which is also by Mino, shows plainly the limitations of his art. A beautiful piece of Renaissance decoration is the tabernacle at Santa Maria in Trastevere, Rome, in which city are also his monument of Cardinal Forteguerri in Santa Cecilia and the monument of Francesco Tornabuoni in Santa Maria sopra Minerva, his latest Roman work and one of his happiest inspirations. His other works include busts of Niccolò Strozzi, in the Museum of Berlin, which also possesses his only female bust, that of a young girl, and San Giovannino, in the Louvre; and reliefs, including numerous Madonnas, from his altars and monuments, to be found in many museums and private collections. Consult: Semper and Barth, *Hervorragende Bildhauer-Architekten der Renaissance* (Dresden, 1880); C. C. Perkins, *Handbook of Italian Sculpture* (New York, 1883); Wilhelm Bode, *Denkmäler der renaissance Skulptur Toscanas* (Munich, 1892-1905); Angeli, *Mino da Fiesole* (Florence, 1905).

MIN'OR (Lat., less). A term in music applied to intervals and modes. (1) The interval between any note and another is named according to the number of degrees between them on the scale, both notes included. The interval between C and E is called a third; that between E and G is also a third; but these intervals are unequal, the one consisting of four semitones, the other of three; the former is therefore distinguished as a major, the latter as a minor interval. (2) There are two modes in which a musical passage may be composed. Whereas the major mode makes use of but one form of scale, which is the same whether *ascending* or *descending*, the minor mode recognizes *two* forms of scale, the *harmonic* and *melodic*. Modern music conceives a mode as a system of three fundamental chords, which contain all the tones proper to the scale of that mode. These chords are the tonic, dominant, and subdominant. Arranging the tones of the *pure* minor scale as elements of these three chords we have the following:

where all three chords present themselves as *minor* (because having the *minor* third), just as the corresponding chords are *major* in the *major* mode. (See MAJOR.) Arranging these tones in this diatonic order as a *descending* scale, beginning with the highest tone of the tonic chord (e), the following results: e, d, c, b, a, g, f, e. Here we have a *pure* minor scale which is identical with the Dorian mode of the Greeks. (See GREEK MUSIC.) Comparing this *descending* minor with the *ascending* major scale, we find each to be the exact opposite of the other, thus establishing the polarity of major and minor already known to Zarlino and Tartini, but fully developed only in 1853 by Hauptmann. Where the *ascending* major has the major third (on third degree) and semisteps (3-4, 7-8) the *descending* minor has the same in the same place:

For practical composition, however, the scale always begins with the tonic. In the progression a, b, c, d, e, f, g, a, the whole step from 7 to 8 was found unsatisfactory to the ear, which imperatively demanded a semistep. By raising g a semistep this leading tone was obtained, but the step from 6 to 7 was augmented. It was only during the nineteenth century that this form of the minor scale a, b, c, d, e, f, g $\sharp$, a, which is known as the *harmonic* minor scale, was proclaimed as the *normal* form. Before that theorists had been afraid of the augmented second from 6 to 7 (a dissonance) and had overcome the difficulty by also raising the sixth degree a semitone, so that *ascending* the minor scale had this form: a, b, c, d, e, f $\sharp$, g $\sharp$, a, while *descending* the 7th and 6th degrees were restored to their original pitch. Thus, what is known as the *melodic* minor scale has two forms, one when ascending, the other when descending. Now, considering the *harmonic* form as the normal minor scale, modern musical theory establishes the dominant chord of both the major and minor modes as a *major* triad. Thus, the three fundamental chords of the modern minor mode present themselves as two minor triads (tonic and subdominant) and one major triad (dominant). See INTERVAL; MODES.

MINOR. In law, a person who has not attained the age of full legal capacity or the age of legal capacity with respect to the performance of certain acts. The term "minor" belongs strictly to the civil law, in which a person of full legal capacity is called major; but generally the term "minor" is used in English as synonymous with infant, under which title the statement of the general law of the subject will be found. In Scots law, minor is sometimes specifically used of an infant above the age of a pupil (12 years for females, 14 for males) and under the full age (21 years) of majority. See INFANT; PARENT AND CHILD.

MINOR, mé'nôr, JAKOB (1855-1912). An Austrian scholar in Teutonic philology and literature, born at Vienna. He studied at the universities of Vienna (1874-78) and Berlin (1878-79), became a lecturer at the former (under Scherer, 1880), in 1882-84 held a chair in the *Accademia Scientifico-letteraria* of Milan, and in 1884-85 was professor of the German language and literature in the University of Prague. In 1885 he was appointed professor of Germanic philology at Vienna. His numerous publications include many editions of texts, such as volumes 73 (*Fabeldichter, Satiriker, und Popularphilosophen des achtzehnten Jahrhunderts*), 145 (*Tieck und Wackenroder*), and 151 (*Das Schicksalsdrama*), with introductory essays and annotations, in the "Deutsche National-Litteratur" series, and the Archduke Ferdinand's *Speculum Vitæ Humanæ* (1889); *Neuhochdeutsche Metrik* (1893), a valuable manual of German prosody, based on lectures given at Vienna in 1882; and important works in literary history and criticism, such as *Die Schicksalsstragödie in ihren Hauptvertretern* (1883), *Goethes Faust* (I. Teil), *Entstehungsgeschichte und Erklärung* (2 vols., 1901); and an uncompleted study of Schiller, *Schiller, sein Leben und seine Werke*, vols. i and ii (1890), ranked, so far as it extends, among the best on the subject. He also edited the works of A. W. and F. Schlegel, A. von Arnim, C. Brentano, L. Tieck, and others.

MINOR, LUCIAN (1802-58). An American lawyer and author, born in Louisa Co., Va. He

graduated at William and Mary College in 1823 and five years later became Commonwealth attorney for his native county, an office which he held until 1852. In 1855 he was appointed professor of law in William and Mary. He wrote a part of John A. G. Davis's *Guide to Justices* (1838) and contributed the notes to Daniel Call's *Virginia Reports*. A tract of his, *Reasons for Abolishing the Liquor Traffic*, had a large sale, and after his death his *Travels in New England* were edited by James Russell Lowell for publication in the *Atlantic*.

MINOR, ROBERT CRANNELL (1840-1904). An American landscape painter, born in New York City. He studied under Díaz at Barbizon, France, and under Van Luppen and Boulanger in Antwerp, and traveled in Germany and Italy. He was elected to the Society of American Artists and the National Academy of Design. He exhibited not only in the United States, but at the Royal Academy, London, and at the salons of Paris and Antwerp. His choice of motives was restricted. He preferred subdued yet richly colored light effects, particularly the glow of sunset and the mystery of twilight, and followed Díaz in his massing of light and shade. His paintings include "Dawn," "Sundown," "The Stream," "October Days," "The Vale of Kennet," "Edge of the Wood," "Interior of the Forest," "Morning in June," "Sunrise on Lake Champlain," "Cradle of the Hudson," "Cloudy Moonlight."

MINOR BARONS. The term applied in the twelfth and thirteenth centuries in England to those tenants in chief of the King who did not receive a special summons to council and to military service, but were summoned by a general proclamation of the sheriff given in the county courts. The term was not used in England after the thirteenth century.

MINORCA (Sp. *Menorca*). The second largest of the Balearic Islands (q.v.). It is the easternmost of the group and lies 20 miles northeast of Majorca (Map: Spain, G 3). Area, 264 (with adjacent islets, 293) square miles. Its north half consists of rather low, rolling hills, generally arid and covered with heath; the south half is an undulating plateau cut by deep, fertile valleys. There are numerous bays on the northeast coast, in one of which is the harbor of Port Mahón (q.v.), the principal town. This harbor is one of the best in the entire Mediterranean. Though minerals are found on the island, agriculture is the chief occupation, the principal products being wine, oil, grain, flax, and sweet potatoes. Pop., 1900, 37,512; 1910, 41,939. Minorca was taken by the British in 1708 and held by them, with several intermissions, until 1802, when it was finally secured to Spain by the Treaty of Amiens. Consult: Sir C. R. Markham, *Story of Majorca and Minorca* (London, 1908); J. E. C. Flitch, *Mediterranean Moods: Footnotes of Travel in the Islands of Mallorca, Menorca, Ibiza, and Sardinia* (New York, 1911); H. W. Richmond, *Papers Relating to the Loss of Minorca in 1756* (London, 1913).

MINORCA. A class of domestic fowls resembling leghorns, but of more length of body and heavier mold. Their flesh is good for table purposes, but their chief value is as egg layers, in which they excel, producing very large white eggs. They are hardy, active in hunting for their food, and generally commendable. A Minorca cock should weigh eight pounds; a hen

six and a half pounds. This breed should be long-bodied and stand high upon strong, slate-black legs; the comb is larger than that of the leghorn; the wattles thin and pendulous; and the ear lobes pure white. Two varieties are recognized—the black and the white. In each case the color must be absolutely pure; the comb, face, and wattles bright red; eyes dark hazel or red. See Colored Plate of FOWLS, under POULTRY.

MINORIES, mī'nō-rīz, THE. A London parish and street leading northward from the Tower to Aldgate, now forming with Houndsditch the Jewish quarter of the city. The name is derived from the nuns of St. Clare, called Sorores Minores, or Minoresses. The church of the Trinity, once belonging to a nunnery of the order, still exists in the Minories.

MINORITES. See FRANCISCANS.

MINORITY REPRESENTATION. See CUMULATIVE VOTING; REPRESENTATION.

MINOR PROPHETS. A common designation for a group of 12 prophetic books in the Hebrew canon, which in the English Bible form the close of the Old Testament. It was employed as early as the time of Augustine and Rufinus, who are careful to explain that its use is occasioned by the brevity of the books and does not characterize their merit or importance. The corresponding designation, major prophets, is applied to the longer books of Isaiah, Jeremiah, Ezekiel, and Daniel. The Hebrews called this group of writings the Twelve, and this nomenclature was followed by the Greeks. (See BIBLE.) The first reference to the collection is in Ecclesiastes xlix, 10, a section probably written in the time of John Hyrcanus. The books included in the collection, in the order in which they are arranged in the Hebrew Bible, are Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, Malachi. This order is retained in the English Bible. In the Greek version the arrangement is as follows: Hosea, Amos, Micah, Joel, Obadiah, Jonah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, Malachi. Both arrangements no doubt were intended to be chronological. There is a general advance from the Assyrian to the Chaldean and Persian periods. The three prophets of the Chaldean period (Nahum, Habakkuk, Zephaniah) and the three of the Persian period (Haggai, Zechariah, Malachi) are given in the same order. On the other hand the earlier prophets seem to have formed two groups in the Greek, viz., Hosea, Amos, Micah, and Joel, Obadiah, Jonah. It is significant that of these six only the first group of three can be assigned to the Assyrian period in the light of modern criticism. It would appear, therefore, that the late books, Joel, Obadiah, and Jonah, once were appended to the others, but subsequently were copied after the prophets of the Assyrian period on account of the reference to Jonah in 2 Kings xiv, 25. The same consideration may have led to the placing of Jonah before Micah as in the Hebrew recension. For the dates of the books and further information, consult the articles upon the individual books.

Bibliography. Many commentaries have been written upon the 12 minor prophets as a whole. The following are the more recent: Rosenmüller, *Prophetæ Minores* (2d ed., Leipzig, 1827); E. B. Pusey, *The Minor Prophets* (2 vols., London, 1860); E. Henderson, *Commentary on the Twelve Minor Prophets* (ib., 1860–61); G. H. A.

von Ewald, *Propheten des alten Bundes* (2d ed., Göttingen, 1867); Reuss, *La Bible*, vol. ii (Paris, 1876); Ferdinand Hitzig, *Die zwölf kleinen Propheten* (4th ed., Leipzig, 1881); Knabenbauer, *Commentarius in Prophetas Minores* (Paris, 1886); F. W. Farrar, *The Minor Prophets*, in "Men of the Bible Series" (London, 1890); Deane, *Minor Prophets* (ib., 1893); Robertson Smith, *Prophets of Israel* (2d ed., 2 vols., ib., 1895); Nowack, *Die kleinen Propheten* (Göttingen, 1897); Julius Wellhausen, *Die kleinen Propheten* (3d ed., Berlin, 1898); Marti, *Dodekapheton* (Tübingen, 1904); Horton-Driver, in *Century Bible* (London, 1906); Hoonacker, *Les douze petits prophètes* (Brussels, 1908); H. K. von Orelli, *Kleine Propheten* (3d ed., Munich, 1908; Eng. trans. of 1st ed., New York, 1893); G. A. Smith, *Book of the Twelve Prophets* (new ed., 2 vols., New York, 1912).

MINOS (Gk. *Mīnos*). According to Greek story, a king of Crete, son of Zeus and Europa, brother of Rhadamanthus and Sarpedon, and father of Ariadne, Deucalion, and Phædra. In the ordinary version he appears as a just and wise ruler, governing Crete and the adjacent islands three generations before the Trojan War and giving them a code of laws received from his father, Zeus. He was a powerful monarch, establishing the first fleet and clearing the Ægean of pirates. He thus exercised a sway over the Greek coast lands. After his death his reputation for justice led the gods to make him a judge in the lower world, where with Rhadamanthus and Æacus he passed sentence on the souls of the dead. In contradiction to this character is the group of legends which gather about the Minotaur, where he appears as at first depriving Poseidon of his due offering, the bull sent by the god from the sea in answer to his prayer. From this bull and Pasiphaë, wife of Minos, sprang the Minotaur (q.v.), for whose keeping Dædalus (q.v.) built for Minos the Labyrinth (q.v.). When his son Androgeos was slain by the Athenians, Minos made war upon them and compelled them to pay the tribute of seven youths and seven maidens to be food for the Minotaur, until Theseus (q.v.) released them by killing the monster. The cruel character of Minos in this legend led later writers to distinguish two kings, the elder, a son of Zeus, who was just, and his grandson, who was cruel. The recent discoveries of a splendid palace at Cnosus and the evidences of a very powerful and splendid kingdom in Crete during the Mycenaean age warrant the belief that the story of Minos contains reminiscences of an early Cretan supremacy in the Ægean. Consult H. R. Hall, *Ægean Archaeology* (New York, 1915). See ARCHEOLOGY, Mycenaean Period; CNOSUS; CRETE; EVANS, SIR ARTHUR; GOUEAIA.

MINOT, mī'nōt. A city and the county seat of Ward Co., N. Dak., 200 miles west-northwest of Grand Forks, on the Mouse River and on the Great Northern and Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: North Dakota, C 2). It is the seat of a State normal school and contains a public library, attractive courthouse, post office and Federal buildings, and Riverside Park, which is crossed by the river three times. Minot is a distributing centre for a wide area and is engaged in lignite coal mining, flour milling, and the manufacture of briquettes. Ample water power is available, the Mouse falling 10 feet here. The water works are owned by the city. Minot has adopted the

commission form of government. Pop., 1900, 1277; 1910, 6188; 1920, 10,476.

MINOT, CHARLES SEDGWICK (1852-1914). An American anatomist, born at Roxbury, Mass. He graduated at Massachusetts Institute of Technology in 1872, studied biology at Leipzig, Paris, and Würzburg, and took the degree of S.D. at Harvard in 1878. At Harvard Medical School he taught from 1880 till his death, becoming James Stillman professor of comparative anatomy in 1905 and director of the anatomical laboratories in 1912. In 1912-13 he served as Harvard exchange professor at Berlin and Jena. He made important investigations and discoveries in the fields of muscular physiology, respiration, and human embryology. He was president of the American Society of Naturalists in 1894, of the American Association for the Advancement of Science in 1901, and of the Association of American Anatomists in 1904-05, and was corresponding member of various important foreign societies. Honorary degrees were conferred on him by Yale, Toronto, St. Andrews, and Oxford. In addition to many papers and monographs, his publications include: *Human Embryology* (1892), which has been translated into German and is one of the most valuable works on the subject; *A Laboratory Text-Book of Embryology* (1903; 2d ed., 1910); *Age, Growth, and Death* (1908); *Die Methode der Wissenschaft* (1913); *Modern Problems of Biology* (1913; also in French).

MINOT, GEORGE (1817-56). An American jurist, born in Haverhill, Mass. He graduated at Harvard in 1836 and at the law department of that institution in 1838, studied under Rufus Choate, and was admitted to the bar in 1839. He practiced in Boston, took high rank in his profession, and was for many years counsel for the Boston and Maine Railroad. He edited, in association with Richard Peter, Jr., eight volumes of the *United States Statutes at Large* and was sole editor of that work from 1848 to 1856. He published *A Digest of the Decisions of the Supreme Court of Massachusetts* (45 vols., with supplement, 1844-52) and edited *English Admiralty Reports* (9 vols., 1853-54).

MINOT, GEORGE RICHARDS (1758-1802). An American jurist. He was born in Boston, graduated at Harvard in 1778, and soon afterward was admitted to the bar. From 1781 to 1791 he was clerk of the Massachusetts House of Representatives. He was secretary of the convention called to ratify the Federal Constitution. In 1792 he was appointed judge of probate for Suffolk County, in 1799 he was made Chief Justice of the Court of Common Pleas, and from 1800 until his death was judge of the Municipal Court of Boston. Besides editing three volumes of the *Collections of the Massachusetts Historical Society*, of which he was one of the founders, he published a *History of the Insurrection in Massachusetts in 1786* (1786) and a *History of Massachusetts Bay* (1798-1803). The latter work is in continuation of Hutchinson's *History of Massachusetts Bay*.

MINOT, LAURENCE (?1300-?52). An English lyric poet, born and bred probably in the north-east midlands of England. He was no doubt a layman. Professor Herford agrees with other scholars in thinking that Minot was probably a soldierly minstrel, who sang also at court. Minot wrote in haste, with the warlike or political events that he describes still fresh in his mind. His style is rough. He is preëminently

a war poet and a patriot, full of love for a united England, though he was himself in all likelihood of Norman origin. He wrote 11 spirited political songs (in the Northern dialect) celebrating the military events of the time. They begin with the *Battle of Halidon Hill* (1333) and close with the *Capture of Guisnes* (1352). Among the best is *How Edward Came to Brabant* (1339). They exist in only one manuscript (British Museum), discovered by Tyrwhitt. The best editions are *Laurence Minot's Lieder*, edited by William Scholle, in *Quellen und Forschungen* (Strassburg, 1884), and *The Poems of Laurence Minot*, edited by Hall (Oxford, 1887).

MINOTAUR (Gk. Μινώταυρος, *Minōtauros*). The bull of Minos (q.v.), according to the Greek legend, son of the wife of Minos, Pasiphaë, and a bull sent by Poseidon. For it she conceived a passion which the skill of Dædalus (q.v.) enabled her to gratify. Her offspring, a human body with a bull's head, was shut up by Minos in the mysterious Labyrinth (q.v.) at Cnosus, where he was fed on human victims. Yearly (or every three or nine years, according to other versions of the story) the Athenians, who had been conquered by Minos, were compelled to send seven youths and seven maidens for this monster, till Theseus (q.v.) slew him. The origin and nature of this story have as yet received no adequate explanation, but the frescoes of the palace at Cnosus showing men and girls performing gymnastic feats upon wild bulls suggest that the origin of the legend is to be sought in dim reminiscences of the Mycæan bull ring. Some scholars connect the Greek name Λαβύρινθος, *Labyrinth*, with Gk. λαβρὺς, *labrys*, a double axe, a hieroglyphic or sacred sign of Zeus, which appears everywhere in the palace at Cnosus (consult R. H. Hall, *Ægean Archaeology*, pp. 152-153, New York, 1915); in this view the Labyrinth is the Place of the Double Axe. The bull was sacred in Crete to Zeus. See MINOS.

MINOT'S LEDGE. See LIGHTHOUSE.

MINOTTO, AGNES MITO. See SORMA, AGNES.

MINSK, minsk. A government of west Russia, in Lithuania, bounded by the Government of Vitebsk on the north, Mohilev and Tchernigov on the east, Kiev and Volhynia on the south, and Grodno and Vilna on the west (Map: Russia, C 4). Area, 35,293 square miles. The northwestern part, about one-fifth of the entire area, is somewhat elevated. It forms the watershed between the Dnieper and the Niemen. The remainder of the government is low, marshy, thickly wooded, and very sparsely inhabited, forming the larger portion of Poliessie (q.v.). Minsk is watered chiefly by the Berezina, the Pripet, and the Niemen; lakes abound in the southern part, and the climate is unhealthy. By the nature of its surface Minsk is not well fitted for agriculture, hence this industry is in a primitive state. Stock raising is favored by the abundance of pasture land. The forests, mostly pine, occupy over one-third of the total area and form one of the chief natural resources of the region. Large quantities of timber are floated to Prussia by the Berezina, the Pripet, and the canal which connects the Dnieper with the Bug, a tributary of the Vistula. Considerable quantities of wood for fuel are exported also to Kiev and used on the local railroads. The extent of this industry may be judged from the fact that about 70,000 people are employed an-

nually in the transportation of the timber down the rivers. Yeast, flour, and wooden products of all kinds are the chief manufactures. The ship-building industry deserves special mention. The government is traversed by two important railways, one connecting Warsaw with Moscow and the other running from the Baltic Provinces to southern Russia. Pop., 1909, 2,755,900; 1913, 2,963,700, composed chiefly of white Russians, Poles, Jews, and Lithuanians. Over 70 per cent of the population belong to the Greek Orthodox church. The government was formed out of part of the territory passing over to Russia on the second partition of Poland in 1793. It consisted till 1843 of 10 districts, but since then nine compose this government. Capital, Minsk.

MINSK. The capital of the Government of Minsk, Russia, situated in a hilly region on the Svislotch, a tributary of the Berezina, 468 miles by rail southwest of Moscow (Map: Russia, C 4). It is an old and irregularly built town, with two cathedrals, of which that of St. Catharine (1611) is especially worthy of mention. Among its educational institutions are two classical Gymnasias and one Realgymnasium, a theological seminary, a museum, and a theatre. Minsk manufactures leather, agricultural implements, soap, tobacco products, etc. The commerce is mostly in agricultural and forest products and leather. A yearly fair is held in March. Minsk is the seat of a Greek Orthodox and of a Roman Catholic bishop. The municipality maintains a pawnshop. Pop., 1904, 97,997; 1910, 105,441, of whom over 50,000 were Jews, about 21,000 Greek Orthodox, 15,000 Roman Catholics, and over 1700 Mohammedans. The town is first mentioned in 1066 as a dependency of the princes of Podolsk. After a short existence as the capital of a separate principality, it fell at the end of the twelfth century into the hands of Lithuania. In 1499 it obtained Magdeburg rights and in 1793 passed to Russia. During the Polish uprising in 1831 several engagements took place in the vicinity of the town, which is the headquarters of the Russian Fourth Army Corps.

MIN'STREL (OF. *menestrel*, *menesterel*, *menestral*, Fr. *ménéstral*, It. *ministrello*, *menestrello*, from ML. *ministralis*, *ministrel*, retainer, Lat. *minister*, attendant, retainer, minister, from *minor*, less). The term first used in the late thirteenth century to designate a retainer who amused his lord with music and song. It has now come to be the generic name for the poet musician, the verse reciter, the mountebank, merry Andrew, juggler, and acrobat of the Middle Ages, as well as for certain modern entertainers. (See below.) Before the Norman Conquest the professional poet was known in England as a *scōp* (shaper or maker). "Maker" sometimes signified a poet in Shakespeare's time. The *scōp* shaped or composed his own poems, and chanted or sang them to the accompaniment of a rude harp. *Widsith* (i.e., Long Travel), perhaps the oldest of extant English poems (for it is earlier than the Angles' inroad of Britain), is an account of the *scōp*'s wandering and reception among the Huns, Goths, Danes, and other peoples. For the tales he recited in the mead hall the *scōp* was rewarded with many treasures, including golden rings and bracelets. The *scōp* was not commonly a wanderer. He was rather attached to the household of some chief, by whom he was maintained, and in some cases rewarded with gifts of land. The *scōp* was held in great

honor. He composed his poems in solitude and recited them in the hall where his master feasted. The recitation was doubtless accompanied by gesture as well as by music.

The *scōp* was first of all a poet, differing from the modern poet mainly in the fact that he not only shaped but also recited his compositions. His theme was the glorious deeds of his chieftain or of some hero of his race. To him we are indebted for our primitive and narrative poems like *Beowulf*. The spread of Christianity in England broke up the old tribal relation and therefore the standing of the *scōp* was changed. In a rank much beneath the *scōp* were the gleemen, who, though they no doubt sometimes improvised songs and modified the matter that came to them, were satisfied for the most part to render what others had composed. They had no settled abode, but strolled far and near, earning what they could by their minstrelsy. (The accompanying illustrations, derived from mediæval manuscripts, give some notion as to the strolling minstrels' looks and demeanor.) Among their accomplishments were tumbling, ropewalking, and feats of jugglery. Some of them chewed stones or appeared to swallow knives or fire. Others had performing animals, such as bears, goats, marmots, dogs, and monkeys.

The Normans brought many *jongleurs* (see *JONGLEUR*) and *troubadours* (q.v.) to England. The minstrels of the Middle Ages were in part descendants of the Teutonic *scōpas* and gleemen who took root in Gaul with the invasion of the Franks, or of those who went along with the

A ROPEWALKER AND JUGGLER.

MINSTREL WITH DRUM, FLAGEOLET, AND PERFORMING BEAR.

Teuton invaders into Italy, England, and elsewhere, in part of the *mimi* and *scurræ* who had once overrun the Roman Empire. With the Celtic bards they have probably no kindred. At the battle of Hastings, Taillefer, minstrel and warrior, rode before the Norman chivalry, tossing his shield aloft, and stirring their courage with the Song of Roland, and there bravely met his death. By the fourteenth century the poet and the performer in England were usually dis-

tinct. The scôp and the troubadour were transformed into poets like Chaucer and Gower. True, there still survived in the structure of their tales several devices of the singers, such as the address to an audience, but the audience was wholly imaginary. The gleemen and jongleurs

MINSTREL PLAYING A REBEC.

were then known as minstrels, of whom the more reputable were still held in great honor. At feasts and festivals they swarmed in great numbers with harps, fiddles, bagpipes, flutes, flageolets, citterns, and kettledrums. Such an occasion is described by Chaucer in the *Squire's Tale*: As Cambuskan dines, the "minstralles" play "beforn him at the bord deliciously." When he goes out he is preceded by "loude ministraleye,"

Ther as they sownen diverse instrumentz
That it is lyk an heven for to here.

But the decline of minstrelsy had already set in, as we know from Langland's *Piers Plowman*, the best single source of information for England. Minstrels as a class Langland severely satirized, calling them prattlers and buffoons, foul and scurrilous of speech, indeed the very children of Satan. Yet in England minstrels may have had a closer connection with genuine poets than they had on the Continent, where from the outset these sons of the Roman *mimi* and *scurrie* (cf. "scurrilous") and of the old bards of the North were abhorred by the Church. Mass and absolution were denied them; indeed, they were under perpetual excommunication and were assured that they would spend eternity at the bottom of hell. Nor had they—on the Continent, at all events—any standing before the secular law. Those who harmed them went unpunished; yet if a minstrel was ill handled he had the privilege of beating the shadow of his offender. As early as 1321 the minstrels of Paris were formed into a guild, and in 1469, in England, a guild of royal minstrels was organized, which minstrels throughout the realm were compelled to join, if they were to ply their trade (or their art) legally.

Most minstrels were itinerant; others were retained by lords as jesters. Not seldom they were women, or, at all events, women followed many a band of minstrels and lived their hard and dissolute life. The very name of minstrel was a byword, but everywhere they were wel-

come. After the invention of printing there was little place for the minstrel as an intermediary between author and public. He gradually found his main occupation as a ballad singer at street corners or at the wassails of the more ignorant barons. Musicians still continued, it is true, to be retained at court, and ample provision was made for their maintenance. But by an act of Parliament in the thirty-ninth year of Elizabeth's reign "ministrels abroad" were classed as "rogues and vagabonds," and were ordered to be punished as such.

In spite of new social conditions, minstrelsy was slow in dying out. George II maintained a company of 24 musicians, who were employed in the service of the Chapel Royal and in rendering odes on birthdays and New Year's. Scott, as is well known, collected the minstrelsy of the Scottish border, consisting of traditional ballads that were still recited; and in the *Lay of the Last Minstrel* is described a wandering harper who is supposed to have lived at the close of the seventeenth century. Recently, too, W. B. Yeats has discovered "the last gleeman in Ireland," a certain Michael Moran, blind almost from birth. "He was," says Yeats, "a true gleeman, being alike poet, jester, and newsman of the people."

A KING MINSTREL.
Head of a minstrel troupe.

The descendant of the old gleeman, it is said, is still not unknown in the Orkneys.

American Minstrels. Towards the beginning of the nineteenth century a new type, the Southern negro, appeared on the American stage. At first he was accepted merely as a comic character, but gradually his songs and eccentricities overshadowed his personal characteristics and he began to be looked upon as a "feature" in the performance. Before the advent of Thomas D. Rice, the reputed founder of negro minstrelsy, there had been a score of actors who, as negro comedians, had sung and danced their way into popular favor; but Rice was the first minstrel whose performance received universal recogni-

tion. His most famous character, Jim-Crow, was drawn from life, its original being an old Louisville slave. In 1836 Rice went to England, where he duplicated his American successes. Individual negro minstrels now became very numerous, and in 1843 the first company, the Virginia Minstrels, was formed. It consisted of "Dan" Emmett, Frank Brower, "Billy" Whitlock, and "Dick" Pelham. The style of performance adopted by them has remained much the same ever since, for they danced, sang, played their instruments, and carried on a running dialogue of jokes. Among the more famous bands of minstrels may be mentioned: White's Kitchen Minstrels, his Virginia Serenaders, his New York Minstrels; Christy's Minstrels, which made a tremendous sensation; Bryant's Minstrels, Wood's Minstrels, and the companies formed by "Tony" Pastor, Thatcher, Primrose, Dockstader, West, Buckley, Backus, Birch, and Bailey. Minstrel performances are usually of one general character. The performers, who are always men and who number from 15 to 40, sit in a semicircle. At either end sit the "end men," or "bones," while in the middle of the line is the "interlocutor," who gravely asks his companions, especially the "end men," such questions as shall bring out their stock of jests. Each member of the troupe takes some part in the performance. The minstrel's characteristic instruments are the guitar, the banjo, tambourine, and the "bones," which are two pairs of ebony sticks, about 1 inch wide and 6 inches long, and are clapped together in the performer's fingers.

MINSTREL, HENRY THE. See HENRY THE MINSTREL.

MINSTREL BOY, THE. A favorite song in Moore's *Irish Melodies*. The music is that of "The Moreen," an old Irish air.

MINT (AS. *mynet*, *mynit*, *mynyt*, from Lat. *moneta*, mint, epithet of Juno, whose temple at Rome was the mint, from *monere*, to warn). An establishment for making coins or metallic money. See MONEY.

The earliest regulations regarding the English mint belong to Anglo-Saxon times. An officer called a reeve is referred to in the laws of Canute

as having some jurisdiction over it, and certain names which, in addition to that of the sovereign, appear on the Anglo-Saxon coins, seem to have been those of the moneyers, or principal officers of the mint. Besides the sovereign, barons, bishops, and the greater monasteries had their respective mints, where they exercised the right of coinage, a privilege enjoyed by the archbishops of Canterbury as late as the reign of Henry VIII and by Wolsey as Bishop of Durham and Archbishop of York.

After the Norman Conquest the officers of the royal mint became to a certain extent subject to the authority of the exchequer. Both in Saxon and Norman times there existed, under control of the principal mint in London, a number of provincial mints in different towns of England; there were no fewer than 38 in the time of Ethelred, and the last of them were only done away with in the reign of William III. The officers of the mint were formed into a corporation by a charter of Edward II; they consisted of the warden, master, comptroller, assay master, workers, coiners, and subordinates.

The seigniorage or coining charge at one time formed a considerable item in the revenues of the crown. It was a deduction made from the bullion coined, and comprehended both a charge for defraying the expense of coinage and the sovereign's profit in virtue of his prerogative. In the reign of Henry VI the seigniorage amounted to 6d. in the pound; in the reign of Edward I, 1s. 2½d. The seigniorage on gold was abolished during the reign of Charles II and has never since been exacted. The shere, or remedy, as it is now called, was an allowance for the unavoidable imperfection of the coin.

A new mint was erected on Tower Hill in 1810. In 1815 some alterations were made in the constitution of the mint, and in 1851 a complete change was introduced in the whole system of administration. The control of the mint was vested in a master and deputy master and a comptroller. The mastership, which had in the early part of the last century become a political appointment held by an adherent of the government, was restored to the position of a permanent office, the master being the ostensible executive head of the establishment. Further changes were made in the administration of the mint in 1869. The mastership was added to the duties of the Chancellor of the Exchequer, without any addition of salary, and the offices of deputy master and comptroller were amalgamated.

Colonial branches of the mint were established at Sydney in 1853, at Melbourne in 1869, and at Perth in 1899 to coin the gold so largely found in Australia, but the silver currency for the Australian Commonwealth has been imported from the Royal Mint, London. Arrangements were made for a silver coinage to be struck in the Commonwealth. A branch of the Royal Mint has been maintained at Ottawa, Canada, since 1908.

The first mint in the United States was established at Philadelphia by the Coinage Act of April 2, 1792; the first production of the new mint was the copper cent of 1793. Silver dollars were first coined in 1794 and gold eagles in 1795. In 1915 there were three coinage mints, located at Philadelphia, San Francisco, and Denver, respectively, and also a mint at New Orleans, where, however, there had been no coinage after 1909 although bullion is received

upon the same terms as at the assay offices. Assay offices are located at New York, Carson City, Helena, Boise, Charlotte, St. Louis, Deadwood, and Seattle. The Act of April 1, 1873, put all the mints and assay offices on the same footing as a bureau of the Treasury Department, under the superintendence of the Director of the Mint, who is appointed by the President for a term of five years and is subordinate to the Secretary of the Treasury. The Philadelphia mint has an engraver who supervises the manufacture of the dies used in all the United States mints.

Processes of Coining. Down to the middle of the sixteenth century little or no improvement seems to have been made in the art of coining from the time of its invention. The metal was simply hammered into slips, which were afterward cut up into squares of one size and then forged round. The required impression was given to these by placing them in turn between two dies and striking them with a hammer. As it was not easy by this method to place the dies exactly above each other, or to apply proper force, coins so made were always faulty and had the edges unfinished, which rendered them liable to be clipped. The first great step was the application of the screw, invented in 1553 by a French engraver named Brucher. The plan

year the government institutions issued 2,033,780 fine ounces of silver bars as compared with 28,903,010 fine ounces from private refineries for use in the industrial arts. A depositor may bring crude gold bullion in any quantity, of \$100 or more in value, and receive either fine gold bars or coin, at his option, a charge of not more than five cents an ounce being made for assaying and refining. For the silver alloy in the gold the owner will be paid at the market value of silver.

If the gold or silver is to be coined into money the pure bars must be mixed with copper alloy; standard coin is composed of 900 parts of gold (or silver) and 100 parts of purest copper in 1000. The law allows a slight variation from this standard, but in actual practice a single gold coin rarely varies more than 0.03 per cent from the standard, either way, and a silver coin, not more than 0.1 per cent, while the average is almost exactly correct. Weighed quantities of gold and copper, or of silver and copper, are melted together in a black-lead crucible, the molten metals thoroughly stirred together, and then poured into cast-iron molds to form ingots. These vary in size according to the denomination of the coins to be made from them. The following table gives the sizes and approximate weights of gold ingots:

DENOMINATIONS	Approximate weight in ounces	Length in inches	Thickness in inches	Width in inches
Double eagles.....	80	12 $\frac{1}{2}$	$\frac{1}{2}$	1 $\frac{1}{2}$
Eagles.....	62	11 $\frac{1}{8}$	$\frac{1}{2}$	1 $\frac{1}{8}$
Half eagles.....	40	12	$\frac{1}{8}$	$\frac{1}{8}$
Quarter eagles.....	33	12 $\frac{1}{2}$	$\frac{1}{8}$	$\frac{1}{8}$

was found expensive at first, and it was not till 1662 that it altogether superseded the hammer in the English mint.

The following description of the method of coining money is based on a pamphlet, *Mint Processes of the United States*, issued by the Treasury Department. The processes required for converting the crude metal into money are: (1) assaying; (2) refining or parting, which reduces the material into ingots or bars of standard purity; (3) reducing the bars to coinage ingots by mixing with them the proper amount of copper alloy; (4) coining, or transforming the coinage ingots into money. The gold and silver which are brought to the mint may be in a crude or manufactured condition and are of varying degrees of fineness. The initial process, therefore, is to assay the metal, in order to determine both its value and the subsequent minting operations necessary to refine it. This process and the succeeding one of refining are described in the metallurgical articles on GOLD and SILVER and under ASSAYING. The bullion thus purified is reduced to bars, a gold bar usually weighing 400 ounces, worth about \$8000. It is now ready to be used for industrial purposes, or for the next stage in the coinage process.

The consumption of gold and silver in the arts and industries is very great. During the fiscal year 1914 the Director of the United States Mint reported that gold bars for industrial use were manufactured in the various mints and assay offices, principally those of Philadelphia and New York, to the coinage value of \$39,767,944. Private refineries furnished \$3,455,841 more. These bars are 0.999 fine. In the same

The ingot for silver-dollar coinage is 1 $\frac{1}{2}$ inches wide, $\frac{1}{2}$ inch thick, and 12 $\frac{1}{2}$ inches long. The ingots are passed repeatedly between heavy rollers to form them into strips, a process which is called "breaking down." After each passage the rollers are screwed tighter, the amount of pressure being regulated exactly by a clock dial. Having been reduced to the proper thickness, the strips are cut into planchets by means of a steel punch working into a matrix. (See DIES AND DIE SINKING.) These planchets are now cleaned and carefully sorted, all that are not perfect or are under the standard weight being set aside to be remelted, while those that are above weight are filed down. The standard weight for gold coins is as follows: Double eagle, 516 grains; tolerance allowed by law, 0.50 grain. Eagle, 258 grains; tolerance, 0.50 grain. Half eagle, 129 grains; tolerance, 0.25 grain. Quarter eagle, 64.5 grains; tolerance, 0.25 grain.

Next comes the process of milling, or producing a raised rim around the edge of the coin, to prevent abrasion. This is accomplished in a milling machine, into which the blanks are fed automatically. The blanks rotate in a horizontal plane in a groove formed on one side by a revolving wheel and on the other by a fixed segment of corresponding groove. Each piece, as it passes through this narrow groove, has its edges forced up into an even rim. After annealing and cleaning, the coins are now ready for the final process of stamping. The planchet, fed to the press through a vertical tube, is automatically placed in a steel collar, whose inner surface is reeded to produce the fluted surface on the milled edge of the coin. Here it is firmly held while the dies close upon it

with enormous force, producing impressions on both sides of the coin. (This process and the preparatory one of engraving and stamping the dies are described under DIES AND DIE SINKING.) The pressure required to produce a clear, sharp impression on the various gold coins is as follows: double eagle, 175 tons; eagle, 120 tons; half eagle, 75 tons; quarter eagle, 40 tons. Double eagles and eagles are struck at an average rate of 80 per minute; half eagles and quarter eagles at a rate of 100 per minute. The pressure required for stamping silver coins is: dollar, 150 tons; half dollar, 110 tons; quarter dollar, 80 tons; dime, 40 tons. The first three are struck at an average rate of 80 per minute, and dimes at the rate of 100 per minute.

The total coinage of gold by the mints of the United States from 1792 to June 30, 1914, was \$3,337,566,310.50.

The domestic coinage for the fiscal year 1914 in the mints of the United States amounted to 199,934,493 pieces, having a value of \$36,047,386.24. The seigniorage on the coinage of silver dollars, subsidiary and minor coins during that year amounted to \$5,661,266.58. (See SEIGNIORAGE.) During 1914 the coinage in the mints of the United States was: gold, \$26,625,810; silver, \$6,240,219.45, and minor coins of nickel and bronze, \$3,181,356.79. In comparison with the coinage of the United States it may be stated that in 1913 Canada coined \$1,986,480 of gold and \$1,327,139 of silver; Great Britain, £27,586,817 of gold, equivalent to \$134,251,245, and silver valued in United States money at \$8,240,094. France in the same year coined 246,281,160 francs of gold, valued in United States money at \$47,532,234, and silver valued in United States money at \$4,179,250. Germany coined 143,525,760 marks in gold, valued at \$34,173,483, and silver valued in United States money at \$12,168,426. The total gold coinage for the world in 1913 was valued at \$318,773,474, of which \$3,372,866 was recoinage. The total coinage of silver in the same year was valued at \$178,301,517, representing 158,557,652 fine ounces, and of this amount \$21,415,372, or 19,324,926 fine ounces, was recoinage. Consult the annual reports of the Director of the Mint and also the various pamphlets on coinage issued by the Treasury Department at Washington. See COINAGE; MONEY.

MINT (AS. *mintē*, Icel. *mintā*, OHG. *minza*, *munza*, Ger. *Minze*, *Münze*, from Lat. *menta*, *mentha*, from Gk. *μνtha*, *mintha*, *μνθη*, *minthē*, mint), *Mentha*. A genus of plants of the family Labiatae. The species are perennial herbs, varying considerably in appearance, but all with creeping rootstocks. The flowers are whorled, the whorls often grouped in spikes or heads. The species are widely distributed over the world; some of them are very common. Water mint (*Mentha aquatica*) grows in wet grounds and ditches, and corn mint (*Mentha arvensis*), which abounds as a weed, in European fields and gardens. These and most of the other species have erect stems. All the species contain an aromatic essential oil, in virtue of which they are more or less medicinal. The most important species are spearmint, peppermint, and pennyroyal; spearmint or green mint (*Mentha spicata*), a native of almost all the temperate parts of the globe, has erect, smooth stems, from 1 foot to 2 feet high, with the whorls of flowers in loose cylindrical or oblong spikes at the top; lanceolate, acute, smooth,

serrated leaves, destitute of stalk, or nearly so. It has a very agreeable odor. Peppermint (*Mentha piperita*), a plant of equally wide distribution in the temperate parts of the world, is very similar to spearmint, but has stalked leaves and flowers in short spikes, the lower whorls somewhat distant from the rest. It is very readily recognized by the peculiar pungency of its odor and of its taste. Pennyroyal (*Mentha pulegium*), also very cosmopolitan, has ovate, stalked leaves, a much-branched prostrate stem, which sends down new roots as it extends in length, and the flowers in distant globose whorls. Its smell resembles that of the other mints. All these species, in a wild state, grow in ditches or wet places. All are cultivated in gardens. The American pennyroyal is *Hedeoma pulegioides*. It grows in dry soils. Mint sauce is generally made of spearmint, which is also used for flavoring soups, etc. A kind of mint with lemon-scented leaves, called bergamot mint (*Mentha citrata*), is found in some parts of Europe, and is cultivated in gardens. Varieties of peppermint and horsemint (*Mentha longifolia*), with crisped or inflated rugose leaves, are much cultivated in Germany under the name of curled mint (*Krauseminze*); the leaves are dried and used as a domestic medicine and in poultices and warm baths. All kinds of mint may be easily propagated by division of the roots or by cuttings.

Peppermint, pennyroyal, and spearmint are used in medicine. The pharmacopœias contain an *aqua*, *spiritus*, and *oleum* of each of them, the official part being the leaves and stems, which should be collected when in flower. Peppermint is extensively used to flavor candy and in mixtures to cover the taste of drugs. Nearly one-half of the oil of peppermint and spearmint now used in the world is produced and distilled in Michigan, the great seat of this industry being in St. Joseph County.

MINT FAMILY. A family of plants. See LABIATÆ.

MINTO, GILBERT ELLIOT, first EARL OF (1751-1814). A British diplomat and administrator. He was educated in Paris and at Edinburgh and Oxford and was called to the bar in 1774. In 1776 he entered Parliament as a Whig. From 1794 to 1796 he was Viceroy of Corsica. In 1797 he was created Baron Minto, and he was Ambassador to Vienna (1799-1801). On his reappearance in the House of Lords he became an advocate of the union of Ireland with England, and afterward strenuously opposed Roman Catholic emancipation. He was Governor-General of India from 1807 to 1813; did much to suppress internal disorder in the regions under his government; annexed the island of Amboyna in 1809, the Molucca Islands in 1810, and Java in 1811; and he captured the isle of Bourbon and the island of Mauritius from the French in 1810. Consult: *The Life and Letters of Lord Minto*, edited by the Countess of Minto, his great-niece (3 vols., London, 1874); id., *Lord Minto in India* (ib., 1880).

MINTO, GILBERT JOHN, fourth EARL OF (1847-1914). A British administrator. He was educated at Eton and at Trinity College, Cambridge, and entered the Scots Guards as an ensign in 1867, resigning in 1870. He served with the Turkish army (1877), in the Afghan War (1879), and was private secretary to Sir Frederick Sleight (afterward Earl) Roberts in Cape Colony (1881). He was a volunteer in

1. Coining Press

2. Milling Machines

3. Automatic Weighing Machines

MINT, ETC.

1. NEW JERSEY TEA (*Ceanothus Americanus*).
2. SPEARMINT (*Mentha spicata*).

3. TALL MEADOW-RUE (*Thalictrum polygamum*).
4. FOUR-LEAVED MILKWEED (*Asclepias quadrifolia*).
5. VIRGINIA GOAT'S-BEARD (*Krigia Virginica*).

the Egyptian campaign conducted by Sir Garnet (afterward Field Marshal Lord) Wolseley; was military secretary to the Marquis of Lansdowne, Governor-General of Canada (1883-85); and was chief of staff to Sir Frederick Middleton during the second Riel rebellion (1885). He returned to England and in 1886 was an unsuccessful candidate for the House of Commons. Later he was Governor-General of Canada (1898-1904) and Viceroy of India (1905-10).

MINTO, WILLIAM (1845-93). An English literary critic. He was born at Alford, Scotland, and graduated at Aberdeen in 1865. He edited the London *Examiner* from 1874 to 1878 and in 1880 became professor of logic and English literature at Aberdeen. He wrote three stories, *The Crack of Doom* (1886), *The Mediation of Ralph Hardelot* (1888), and *Was she Good or Bad?* (1889), but is chiefly known as a critic. In this latter field he published many well-known works, including: *Manual of English Prose Literature, Biographical and Critical* (1872); *Characteristics of English Poets from Chaucer to Shirley* (1874); *Daniel Defoe*, for the "English Men of Letters Series" (1879). There appeared posthumously *University Extension Manual on Logic* (1893); *Plain Principles of Prose Composition* (1893); *English Literature under the Georges* (1894). Original in method, he ably defended many novel hypotheses.

MINTON, THOMAS (1765-1836). An English pottery manufacturer, originally an engraver, who worked for Spode in London and in 1791 established a plant of his own at Stoke-upon-Trent, where he made principally majolica and reproductions of the works of Della Robbia and Palissy. The business was continued by his son, Herbert (1793-1858), and was incorporated in 1883. During the latter half of the nineteenth century, under the artistic direction of Leon Arnoux of the old family of French potters, Minton porcelain compared favorably with that produced at Sèvres. See POTTERY; PORCELAIN.

MINUCIUS FELIX. See FELIX, MARCUS MINUCIUS.

MINUET, mīn'û-ët' (Fr., small, dim. of *menu*, from Lat. *minutus*, small, p.p. of *minuere*, to diminish, from *minor*, less; connected with Gk. *μῦνς*, *minys*, small, Skt. *mī*, to make small, Goth. *minniza*, OHG. *minniro*, Ger. *minder*, AS., archaic Eng. *min*, less; so called because of the small steps taken in the dance). A graceful and stately dance of French origin. It is supposed to have originated in Poitou and was introduced into Paris in 1650. The first-known minuet tunes were written by Lully (q.v.) in 1653. The minuet was a favorite at the court of Louis XIV and in the reign of Charles II was carried over into England, where it continued popular until the time of George II. In Russia it flourished during the reigns of Peter the Great and Catharine II. At first the minuet was in three-quarter time and consisted of two eight-bar phrases, each of which was repeated. Mozart's minuet in *Don Giovanni* shows the form of the early dance. It was soon, however, extended by the addition of a second movement (written in three-part harmony and hence called trio) and by increasing the number of bars. Bach and Handel often introduced the minuet into their suites. Those of the former are especially famous, and Handel also used it as a concluding movement for operatic and oratorio

overtures. The minuet is of particular importance because of the position it occupies in the history of the symphony, which is an evolution of the suite. Haydn was the first to employ it in the symphony, but he changed its character by quickening the time and making it vivacious rather than stately. Mozart used Haydn's form, retaining the rapid *tempo*, but gave it a tender, graceful significance. With Beethoven its history practically ceases, for he transformed it into the *scherzo*, thus making it an integral part of the symphony. Its use by later composers, Schumann, Mendelssohn, and others, is comparatively rare. See DANCING; SUITE; SYMPHONY.

MINUIT, mīn'û-it, PETER (1580-1641). An early governor of New Netherland. He was born in Wesel, on the Rhine; was a deacon for a time in the Protestant or Walloon church there; removed to Holland early in the seventeenth century; and in December, 1625, received from the Dutch West India Company the appointment of Governor and Director General of New Netherland. He reached Manhattan Island May 4, 1626, and soon afterward purchased the island from the Indians, obtaining it for the sum of 60 guilders (about \$24). He built Fort Amsterdam, defended with great courage and determination the claim of the Dutch to rightful possession of the island, and administered the affairs of his office judiciously and to the general satisfaction of the colony. The fact that the patroons were successful in establishing titles to enormous tracts of land became objectionable to the Dutch West India Company, who placed the responsibility on the shoulders of Minuit. In 1631 he was accordingly recalled by the company, and sailed for Holland in the following spring, but was driven into Plymouth, England, by a gale. Here he was charged with having prosecuted illegal trading within English dominions, and his vessel was attached on complaint made by the Council for New England. In May, however, his vessel was released. Minuit made every effort to reestablish himself in the favor of the Dutch West India Company, but without success, and finally offered his services to the government of Sweden. Through the influence of Oxenstiern, then Chancellor, a Swedish West India Company was organized and Minuit was commissioned to establish a Swedish colony in America. He accordingly gathered together a sufficient number of Swedes and Finns for this purpose, sailed from the port of Gothenburg, Sweden, in 1637, and early in 1638 built Fort Christiana, near where the city of Wilmington, Del., now stands. The Swedish colonization scheme was bitterly opposed by the Dutch, who threw every obstacle in the way of its success, and eventually captured the colony and annexed it to their possessions in 1655. Consult Kapp, "Peter Minnewet aus Wesel," in *Historische Zeitschrift*, vol. xv (Munich, 1866), and J. J. Mickle, "Some Account of William Usselinx and Peter Minuit," in the *Delaware Historical Society Papers* (Wilmington, 1881).

MINUSINSK, mē'nû-sēnsk'. A town of southern Siberia, in the Government of Yeniseisk, situated on the Yenisei, 300 miles south-east of Tomsk. It has a high school for girls, a good museum and library, and considerable trade in grain, cattle, and placer gold. The neighboring country is rich in coal, iron, and salt lakes. Pop., 1897, 10,255; 1911, 15,584. Minusinsk is also the capital of a district bear-

ing the same name, with an area of 43,388 square miles and a population in 1912 of 257,800.

MINUTE, min'it (OF., Fr. *minute*, from Lat. *minutum*, small portion, from *minuere*, to make small). A term applied to the sixtieth part of an hour and to the sixtieth part of a degree of a circle. In architecture the term "minute" is applied to the sixtieth part of the diameter of the shaft of a classic column, measured at the base; it is used as a measure to determine the proportions of the order.

MINUTEMEN. In American history, those civilians, in Massachusetts and several other colonies, who, on the approach of the Revolutionary War, pledged themselves to take the field at a minute's notice. In Massachusetts they were enrolled in pursuance of an Act of the Provincial Congress passed Nov. 23, 1774.

MINUTOLI, mé-nōō'tō-lē, HEINRICH, BARON MENU VON (1772-1846). A Prussian officer and archaeologist. He was born in Geneva of an old Italian family, early entered the Prussian army, and distinguished himself in 1793 in the Rhenish campaign against France, being severely wounded at Bitsch. After his recovery Frederick William III promoted him to be major general, and in 1820 made him head of the Prussian archaeological expedition to Egypt. In 1822 he was made a member of the Academy of Sciences. His valuable Egyptian collection was bought for the Berlin Museum by the King of Prussia. Minutoli's last years were spent in retirement at Lausanne. He wrote: *Ueber antike Glasmosaik* (1814), with Klaproth; the important *Reise zum Tempel des Jupiter Ammon und nach Oberägypten* (1824-27); *Ueber die Anfertigung und Nutzanwendung der färbigen Gläser bei den Alten* (1837); *Beiträgen über die Kriegskunst* (1816); *Beiträge zu einer künftigen Biographie Friedrich Wilhelm III.* (1838-44); *Der Feldzug der Verbündeten in Frankreich*, 1792 (1847).

MINYAS (Gk. Μινύας, *Minyas*). A legendary hero connected with the Boeotian city Orchomenos (q.v.). He is called son of Poseidon in the earlier writers, but in Pausanias his father is Chryses, and he is famed for his riches and as builder of the first great treasury—really the domed tomb of Orchomenos. His fame in legend is connected with the fate of his three daughters, Leucippe (or Leuconoe), Arsippe (or Arsinoë), and Alcathoe, who, refusing to take part with the Mænads in the orgies of Dionysus, were visited by the god with Bacchic madness, in which they tore to pieces the young son of Leucippe. Their story was acted at the festival of the Agrionia, where the priest of Dionysus, with a drawn sword, pursued women of the family of the Minyadae. The Argonauts from Iolcos in Thessaly were also called *Minyae*, but the original connection with Minyas is very doubtful, and the statements of the ancients are obviously mere attempts to explain the identity of name. Consult Ovid, *Metamorphoses*, iv, 1 ff., 389 ff., and W. H. Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. ii (Leipzig, 1890-97).

MIocene EPOCH (from Gk. *μειων*, *meiōn*, less + *καινός*, *kainos*, new). A division of geologic time following the Oligocene and preceding the Pliocene epochs of the Tertiary period. It is represented along the Atlantic coast of North America by a belt of unconsolidated sands and clays that begins in Marthas Vineyard but is concealed in the interval between there and New Jer-

sey. From that State southward to Florida the beds are continuous and also extend to the west along the Gulf coast into Texas, where they attain a thickness of 1500 feet. In the south they include compact limestones and conglomerates. In California extensive gravel beds were laid down along the streams that flowed west from the Sierras and these gravels form the so-called "deep" and "bench" gravels which are worked for gold. The coasts of California, Oregon, and Washington were still largely submerged and marine deposits were formed in that section. In the interior region are found fresh-water strata of Miocene age, including the John Day beds of eastern Oregon, which contain also volcanic tuffs and ashes and which are from 3000 to 4000 feet thick, and the Loup Fork stage of Montana, South Dakota, and the region southward as far as Mexico. Miocene time was characterized by extensive geographical changes through volcanic activity and regional upheaval. Near the close of the epoch North and South America were finally joined together by the up-raising of the Isthmus of Panama, the West Indies were elevated, and the coastal lands of the United States were increased by the emergence of the belt from New Jersey to Texas. Notable changes likewise took place in Europe, such as the joining of Spain and Africa and the final severance of connection between the Mediterranean and the Indian Ocean.

The life of the Miocene included many forms of very modern aspects. Among the larger mammals are mastodons, camels, rhinoceroses, and early forms of the ruminants, from the fresh-water beds of the western region. The horse family was represented by *Protohippus* and *Hippotherium*, larger than the Eocene horses but still possessing three toes. In the marine beds are found whales, dolphins, and numerous invertebrates. Consult: "Correlation Papers—Neocene," in *United States Geological Survey, Bulletin*, No. 84 (Washington, 1892); Report on "Miocene," *Maryland Geological Survey* (Baltimore, 1904); Chamberlin and Salisbury, *Geology*, vol. iii (New York, 1907). See GEOLOGY; TERTIARY SYSTEM.

MIOGA, mé-yō'gà. See ASARABACCA; GINGER. **MI'OHIP'PUS** (from Eng. *miocene* + Gk. ἵππος, *hippos*, horse). A name sometimes used to designate the Upper Miocene stage of evolution of the horse, represented by the genus *Anchitherium*. See HORSE, FOSSIL.

MIOLAN, myō'lān', FÉLIX. A name sometimes used by the French singer Marie Caroline Félix Carvalho (q.v.).

MIONNET, myō'ná', THÉODORE EDMÉ (1770-1842). A French numismatist, born in Paris, where he studied in the Collège du Cardinal le Moine and in the Ecole de Droit. After four years of legal practice and a short term in the army, from which he retired because of illness, he became assistant in 1800 in the numismatic cabinet in the Bibliothèque Nationale, and there began to catalogue the collections. He traveled in Italy, made many valuable numismatic finds, and in 1830 was elected to the Academy of Inscriptions. His great works, which still have a distinct scientific value, are *Description des médailles antiques, grecques et romaines* (17 vols., 1806-30) and *De la rareté et du prix des médailles romaines* (1815; 3d ed., 1847). Consult C. A. Walckenaer, *Notice historique sur la vie et les ouvrages de M. Mionnet* (Paris, 1846).

MIOT DE MÉLITO, myō de mál'lé'tó', ANDRÉ

FRANÇOIS, COUNT (1762-1841). A French statesman and writer, born at Versailles. Entering the administration of the French War Department, he remained there when the Revolution broke out, although he upheld the principles of constitutional monarchy. In 1793 he was made Secretary General for Foreign Affairs and two years later was sent as French Envoy to Florence. In the following year he went to Corsica to aid Joseph Bonaparte in the pacification of that island after its evacuation by the British. Returning to Paris in 1798, he was Secretary General of the War Department and a counselor of state under the Consulate. From 1806 to 1813 he served with Joseph Bonaparte in Italy and in Spain. In 1814 he was created Comte de Melito. He served with Napoleon during the Hundred Days and then retired from public life. His translation of Herodotus (3 vols., 1822) and Diodorus (7 vols., 1835-38) gained him admission to the French Academy. His *Mémoires sur la consulat, l'empire, et le roi Joseph* (3 vols., 1858) appeared in an English translation by Mrs. C. Hoey and J. Lillie in 1881.

MIOTICS. Those drugs which produce contraction of the pupil of the eye. They act by stimulating the terminal filaments of the third or motor oculi nerve and paralyzing the filaments of the sympathetic nerve. The principal miotics are eserine and pilocarpine, used locally by eye surgeons, and morphine, and nicotine, which produce miosis when taken internally in poisonous doses. Drugs which produce dilatation of the pupil are called mydriatics (q.v.).

MIQUEL, mé-kél', JOHANNES VON (1828-1901). A German statesman, born in Neuenhaus, Hanover, of a family of French émigrés, and educated for the bar at Heidelberg and Göttingen (1846-50). In his student days he was a rabid revolutionist and something of a Socialist, but when the period of reaction set in he soon forsook his earlier sentiments. His practice in Göttingen was very successful, and in 1864 he was elected a member of the Lower House of the Hanoverian Diet and in 1865 burgomaster of Osnabrück. Removing to Berlin in 1870, he was a director of the Diskontogesellschaft until 1873, and then president of its advisory board until 1876. Then he was again made chief burgomaster of Osnabrück and in 1880 of Frankfort-on-the-Main. But his greater field of usefulness was in the Prussian House of Deputies (to which he was elected in 1867) and in the Imperial Diet (1887-90). There, as in the Prussian House of Lords, of which he was ex officio a member as chief burgomaster of Frankfort, he was a leader of the National Liberal party and one of Bismarck's most able and forceful lieutenants. In 1890 he became Prussian Minister of Finance, and was hailed as the "Emperor's man," no doubt to reassure the country in face of its fear that the new Imperial policy was to be reactionary. In this office, which Miquel held up to a few months before his death, he showed himself an able financier and a bold reformer in his attempt to liberate the Imperial treasury from depending on the contributions of the various states. As a politician he was an opportunist and sacrificed his convictions in the hope that he might be made Chancellor. But if he was unsuccessful in his programme of Imperial finance, in his more proper sphere of Prussian finance, by playing somewhat into the hands

of the Agrarian party, he secured the adoption of a new tax system which greatly benefited the working classes and at the same time tremendously increased the revenue. He was ennobled in 1897. On his Prussian policy, consult Zedlitz und Neukirch, "Miquel als Finanz- und Staatsminister," in *Preussische Jahrbücher* (Berlin, 1901).

MIQUELON, mīk'e-lōn' or mē'k'lōn'. An island near Newfoundland. See SAINT PIERRE AND MIQUELON.

MIR, mēr (Russ., OChurch Slav. *mirŭ*, union, peace, world, Lith. *mers*, Alb. *mir*, peace). The name of the civil communities of the Russian peasants. All land is held in common and is divided, usually according to the number of males at the last census, being redistributed whenever necessary. Each family receives meadow, forest, and arable land, the meadow being sometimes kept in common and only the grass divided. The mir, or village commune, as a body is assessed for taxes by the central government, and the burden of taxation is distributed among the heads of families, according to the amount of land occupied by each. Each mir is self-governing, with elected officers, and adjoining mirs may be grouped in volasts, or small cantons. The system is very old, but is gradually changing, as a mir may now go over to private ownership of land and inheritance of property on vote of two-thirds of its members. Consult Keussler, *Zur Geschichte und Kritik des bauerlichen Gemeindebesitzes in Russland* (St. Petersburg, 1876-87), and D. M. Wallace, *Russia* (new ed., New York, 1905).

MIRABEAU, mé'tá'bō', GABRIEL HONORÉ RIQUETI, COUNT DE (1749-91). A French orator and statesman. He was the second son of Victor Riqueti, Marquis de Mirabeau, a celebrated economist, and was born at Bignon, near Nemours, March 9, 1749. After several years of private instruction the young Mirabeau was placed (1767) in a fashionable military school in Paris, where he became proficient in languages and in the accomplishments of good society. In 1767 he joined the Berry cavalry regiment and the next year he received a second lieutenant's commission, but his freaks of conduct and his love affairs, one of which brought him into rivalry with his colonel, caused his imprisonment in the citadel of the island of Ré, from which he was released, at his father's request, in March, 1769. The condition of his release was that he should join the expedition to Corsica, and as a member of the Legion of Lorraine he served with credit in the subjugation of that island. In 1771 he was commissioned captain of dragoons and in 1772 he was married at Aix to Marie Emilie de Covet, only daughter of the Marquis de Marignane. Of this union one son, Victor, was born in 1773, but he died in 1778. Debts, quarrels with his father and wife, and an altercation with the Marquis de Villeneuve-Monans led to his imprisonment by *lettre de cachet* in the castle of If in 1774. Mirabeau even during his imprisonment managed to fall violently in love with the young Marquise de Monnier; trouble ensued, and he finally escaped to Switzerland, where he was joined by Sophie, as he called his mistress, and in October, 1776, they settled in Amsterdam, where Mirabeau gained a livelihood as a hack writer. In the meantime the French courts passed sentence upon the runaway lovers, who were arrested in May, 1777, and brought to

Paris, where Sophie was kept under close surveillance, while Mirabeau was imprisoned at Vincennes. For three years and a half he was kept in close confinement, but through his guard, a brother Freemason, he was able to carry on his famous correspondence with Sophie. As a prisoner he devoted himself to the translation of numerous classics and to the production of various original works, some of which were later published. After his release in December, 1780, he forsook Sophie, who, after another love affair, committed suicide in 1789. Then he returned to Pontarlier, secured the revocation of the death sentence, which had been passed on him for the seduction of Sophie, and later went to Aix, where, after a trial in which he ably conducted his own suit, he separated from his wife in 1783.

Because of his suits at Pontarlier he found it advisable to leave France for a few months, which he spent at Neuchâtel, where he met the Genevese Liberals Clavière and Duroveray and where he published his *Des lettres de cachet et des prisons d'état*, the best known of his earlier writings. From September, 1783, to August, 1784, he was in Paris, where he seems to have begun his lifelong intimacy with Henriette van Haren, a young woman of 19, known as Madame de Nehra, whose influence over Mirabeau was exerted entirely for his good. In August, 1784, he withdrew to London to allow another storm to blow over. In England he met his old school-fellow, Sir Gilbert Elliot (later first Earl of Minto), Mr. (later Sir) Samuel Romilly, Lord Lansdowne, and other well-known men. He there wrote the *Considérations sur l'ordre de Cincinnatus*, which caused a sensation in the United States. After nine months in England the intercessions of Madame de Nehra enabled him to return to Paris, where he entered into intimate relations with the Genevese exiles and other Liberals, like Brissot, and wrote numerous pamphlets on financial questions, published during 1785. These were followed (1787-89) by his attacks on stockjobbing and his criticisms on Necker's administration of the finances. In the meantime he had twice visited Prussia, once on a secret mission for the government. On his first visit (December, 1785, to May, 1786) he was received by Frederick the Great, whose death occurred during his second visit at Berlin (July, 1786, to January, 1787). In 1787 he failed in an attempt to secure the position of Secretary to the Assembly of Notables, and his attacks on Necker drove him to take refuge in Prussia. Returning from this third visit to Berlin, he published in 1788 his most famous work, *De la monarchie prussienne sous Frédéric le Grand* (8 vols. and atlas, London, 1788).

In October, 1788, Mirabeau once more was reconciled with his father, and in January, 1789, he arrived at Aix to participate in the elections to the States-General. In April, having been rejected by his own order, the nobility, he was elected by the Third Estate both of Aix and of Marseilles to the States-General, and he chose to represent the former city. He was in Paris in time to publish on May 2, 1789, the first number of his newspaper, which, after some changes of title, finally took the name of *Courrier de Provence*, and a few days later to be present at the opening of the States-General at Versailles. He never had a following upon whom he could depend in the States-General,

where his success was always a result of his ability to take advantage of temporary enthusiasm or excitement—by his fluent oratory and the power of his personality. The true greatness of Mirabeau was not revealed until the publication of his works, and especially his correspondence with La Marck, many years after his death. From the first Mirabeau saw that the royal and ministerial scheme of financial reform would be insufficient to cure the existing evils, but he thought that reforms could be successfully carried out only by a strong and moderate government. He was the most powerful supporter of the idea of a limited or constitutional monarchy. From the opening of the States-General until his death two years later Mirabeau was the most important figure in public life in France, and the story of his life is that of the Revolution in its earlier stages. He took part in the debates concerning the status of the members of the Third Estate, and his attitude as their spokesman at the royal session of June 23 marked him as the champion of the Third Estate in the struggle which ended in the reorganization of the States-General as the National Assembly. He protested vigorously against the attempt to overawe the Assembly by the mobilization of troops around Paris, but his father's death on July 13 prevented his participation in the stirring events of the following day when the Bastille was stormed and destroyed by the populace of Paris. The protracted debates on the rights of the individual, and the radical measures for the destruction of the old order taken by the Assembly on August 4, called forth his protests. Still he recognized the importance of the proposed Declaration of the Rights of Man and took an active part in framing it. One by one he brought forward his favorite constitutional measures and defended them with all his powers of logic, eloquence, and persuasion, only to see them voted down. Nevertheless, there was hardly an important law passed by the National Assembly which did not show the influence of Mirabeau's views. After the failure of his proposition to choose the royal ministers from the members of the National Assembly, on Nov. 7, 1789, Mirabeau strove earnestly to put his great abilities at the service of the King, whom he had attempted to advise as early as October 15. He tried to work with Lafayette and Necker, but everywhere he was viewed with suspicion, his advice was never followed, and his assistance was rejected entirely or accepted with ill grace. Finally in May, 1790, he abandoned his attempts to coöperate with Necker and Lafayette, and, through La Marck, entered into regular relations with the King and Queen, for whom he wrote his famous series of notes of advice. This change was marked in the Assembly by his speech in favor of the royal prerogative, especially in questions of peace and war, which directed suspicion towards him, and caused a temporary outburst of popular indignation against him. He was largely responsible for Necker's resignation in September, 1790, and for the appointment of Clavière in his place. In July he had been placed on the Diplomatic Committee of the Assembly and, in coöperation with his old friend Montmorin, the Minister of Foreign Affairs, had dealt with the perplexing questions of foreign relations, such as the annexation of Avignon and the maintenance of the Family Compact with Spain. He insisted that

no other country should interfere in the internal affairs of France; that other countries must keep their agreements with France; and that France must respect her agreements with other countries. On Nov. 30, 1790, he was elected president of the Society of the Friends of the Constitution, popularly known as the Jacobin Club, and on Jan. 29, 1791, he received the coveted honor of election as president of the National Assembly. His last note to the court, through La Marck, was sent on February 3. His last appearance in the Assembly was on March 27. On April 2, 1791, he died in the Rue de la Chaussée d'Antin in Paris. He was buried in the church of Ste. Geneviève (the Panthéon), but three years later his remains were removed to make room for those of Marat.

The greatness of Mirabeau has been generally recognized, but in estimating the details of his life and policy there has been the widest divergence of opinion. French republicans have condemned him unsparingly for his monarchical sympathies, but most of all because in return for his services the court paid his debts and supplied him with funds. In his defense it must be said that Mirabeau regarded himself as *de facto* prime minister, charged with the duty of saving France, a task to which he felt he alone was equal. The keynote of his advice to the court was that the King should transfer the court and the Assembly from Paris to Fontainebleau, or Compiègne, or some other small town of central France, where the influence of the mob of Paris would cease to control the Assembly and the King and the Assembly would be free to give France a strong monarchical constitution. Mirabeau had great power over men and made those who came under his fascination willing to merge their personalities in his and allow him to take all the credit for their labors. The *Souvenirs* of Etienne Dumont, one of his collaborators, first showed fully Mirabeau's methods of work and the way in which he made regular use of the services of Dumont, Reybaz, Pellenc, and even better-known persons like Clavière and the Abbé Lamourette. In Mirabeau everything was on a colossal scale; in personal appearance and moral character he was almost a monster; in intellect and powers of endurance he was a Titan. In his personality all that was noblest and best of the French Revolution seemed combined with the greatest of its characteristic evils. Some historians have mourned Mirabeau's death, because they believed that had he lived he would have saved France from the excesses of the Reign of Terror through his gift of practical statesmanship and his freedom from the doctrinaire vagaries that obsessed some of the later leaders of the Revolution.

Bibliography. Mirabeau, *Œuvres* (9 vols., Paris, 1825-27), is the most complete collection of his writings, but lacks the *Monarchie prussienne*; *Mémoires de Mirabeau écrits par lui-même, par son père, son oncle, et son fils adoptif* (9 vols., ib., 1834-35) is still the most important authority, in spite of many defects. Consult: P. F. Willert, *Mirabeau* (London, 1898); H. M. Stephens, *The French Revolution* (New York, 1902); Thomas Carlyle, *The French Revolution*, edited by J. H. Rose (3 vols., ib., 1902); H. E. von Holst, *The French Revolution Tested by Mirabeau's Career* (2 vols., Chicago, 1894); C. F. Warwick, *Mirabeau and the French Revolution* (Philadelphia, 1905). For Mira-

beau's relations with the court, consult *Correspondance entre le Comte de Mirabeau et le Comte de la Marck pendant les années 1789, 1790 et 1791* (Paris, 1851), and F. Schwartz, *Mirabeau und Marie Antoinette* (Berlin, 1891). For Mirabeau as an orator, see F. V. A. Aulard, *L'Eloquence parlementaire pendant la révolution française* (Paris, 1882); for his methods of work, E. Dumont, *Recollections of Mirabeau and of the Two First Legislative Assemblies of France* (Eng. trans., London, 1832), and Reybaz, *Un collaborateur de Mirabeau* (Paris, 1874); for his election to the States-General, G. Guibal, *Mirabeau et la Provence* (ib., 1887-91); for his career in the Assembly, Reynald, *Mirabeau et la Constituante* (ib., 1872); also G. Leloir, *Mirabeau à Pontarlier* (ib., 1886). The best lives are Alfred Stern, *Das Leben Mirabeaus* (Berlin, 1889); L. L. de Loménie, *Les Mirabeau* (5 vols., Paris, 1889-91); A. J. T. Mézières, *Vie de Mirabeau* (ib., 1892); S. G. Tallentyre, *Life of Mirabeau* (London, 1908); Louis Barthou, *Mirabeau*, translated from the French (ib., 1913), containing a bibliography. Of other biographies may be mentioned: Victor Hugo, *Etude sur Mirabeau* (Paris, 1834); Auguste Vermorel, *Mirabeau, sa vie, ses opinions et ses discours* (5 vols., ib., 1879-80); Jules Barni, *Mirabeau* (ib., 1882); A. J. E. Rousse, *Mirabeau* (ib., 1891); W. R. H. Trowbridge, *Mirabeau, the demi-god* (London, 1907). See also Etienne Charavay, in *La grande Encyclopedie* and Albert Sorel, in *Essais d'histoire et de critique* (Paris, 1883); Cabanis, *Journal de la maladie et de la mort de Mirabeau*, edited by H. Duhne (ib., 1890). For his father, Victor Riqueti Mirabeau (1715-1789), consult also, L. G. L. G. de Lavergne, *Les économistes français du 18me siècle* (Paris, 1870); August Oncken, *Der ältere Mirabeau* (Bern, 1886); H. Ripert, *Le marquis de Mirabeau* (Paris, 1901).

MIRACLE PLAY (OF., Fr. *miracle*, from Lat. *miraculum*, miracle, from *mirari*, to wonder, from *mirus*, wonderful; connected with Gk. *μεῖδαν*, *meidan*, Skt. *smi*, to smile). Strictly, the second stage in the development of the modern drama under religious auspices, though it is sometimes confounded with the first, for which, and for a general account of this development, see MYSTERY. The distinction between the two, where it is made, is based on the fact that whereas the mysteries proper took their subjects from the Scripture narrative, centring about the life of Christ and the great mysteries of the Christian faith, the miracle plays were taken rather from the lives of the saints. The significant features of this change were that by getting away from the sacred text of the Scriptures greater latitude was gained and a greater range of characters; a nearer approach to a representation of contemporary life was thus also permitted, and a freer introduction of the comedy element than reverence would allow in the earlier form. Matthew Paris mentions a miracle play, *Ludus de Sancta Katharina*, that was performed at Dunstable about 1110, under the direction of a certain Geoffrey, afterward abbot of St. Albans. Again, William Fitz-Stephen, in his *Life of Thomas Becket* (about 1182), writes approvingly of London plays on

the miracles and sufferings of martyrs and confessors. Other miracle plays, based on the lives of St. Fabian, St. Sebastian, St. Botolph, St. George, and St. Crispin, were performed in the fourteenth, fifteenth, and sixteenth centuries. Very few texts of English miracle plays have been preserved; but from numerous continental specimens it may be inferred that they were in aim and structure similar to the mysteries. At the end of the nineteenth century and at the opening of the twentieth something like a revival of this dramatic form, or of this form blended with the mystery play, was attempted with some success in France, in England and Ireland, and in Germany, the efforts of Maeterlinck and Yeats being worthy of note. For bibliography, see MYSTERY.

MIRACLES (Lat. *miraculum*, wonder). An event or an effect in the physical world not explicable by known natural law and therefore assigned to a supernatural cause. Thus defined, an event which is a miracle in one age is not in another, when its natural causes have come to be understood. The conception of the direct action of the gods in certain events goes far back of the idea of natural law into the earliest history of the race. The unusual event was a wonder and challenged attention. It was naturally explained as the action of some invisible, superhuman power. The meaning of miracles still preserves the memory of this primitive conception. The next step was to regard this wonder as a sign of the presence or power of the divine being who caused it; so miracles came to be looked for especially at the shrines of the gods or on the occasion of sacrifices. The temple of Æsculapius in Greece was filled with the crutches and staffs of the lame who had been healed by the god, and religious story contains many tales of how the gods verified their presence at a sacrifice by some striking event. Aside from this, however, unexpected and startling occurrences might always be assigned to the gods. Certain classes of events which seemed to have no visible causes were quite uniformly assigned to the direct will of the gods—like thunder, which the Psalmist calls "the voice of God," and dreams, trances, and waking visions, when vivid and inexplicable. The Hebrew race shared with all the ancient world a ready belief in the abundant direct activity of God in the world. In fact, natural and supernatural is not the proper antithesis to use of ancient ideas, but rather usual and unusual, expected and unexpected. A worshiper might demand such a proof of the presence and approval of God as did Gideon in the matter of the fleece. (Judg. vi. 36–40.) The Old Testament represents, in its consideration of miracles as well as in other things, the primitive point of view. One may say that the conception of miracles, as understood by Christian theology, had not yet arisen. Dreams and their interpretation are believed to come from God, and even the life of the beasts is the direct gift of breath from God. (Ps. civ. 29, 30.) At the same time, unusual events are taken as signs from God and as verification of the words of his prophets. (1 Sam. xii. 16–18.) In this evidential use of the unusual in nature lies the beginning of the later Christian conception of a miracle as an event not explicable by natural law and having a religious purpose. The New Testament expresses various ideas of the significance of such events in its various terms for them—wonders, powers, signs, works;

but the chief value of miracles to the writers of the New Testament lies in their use as evidence of the presence and power of God. Though Christ himself never based the authority of his teachings on the evidence of miracles, yet it is plain that the feeling both of the populace and of the early Church is expressed by the saying of Nicodemus: "We know that thou art a teacher come from God; for no man can do these signs which thou doest except God be with him." (John iii. 2.) The apostolic church also believed that miraculous events occurred among them and were tokens of the working of the spirit of God. (Acts xi. 15–18; 1 Cor. xii. 4–11.) Even in the subapostolic church the divine power was held to be manifested, especially in the name of Jesus. (Heitmüller, *In Nomen Jesus*, Göttingen, 1903.) Clement of Rome, Irenæus, Origen, Athanasius, Augustine, and Jerome all bear witness to the belief in contemporaneous miracles. So far the belief in miracles created no particular problem, but was a natural inference from the belief in any supernatural power actively interested in the affairs of the world.

The problem of miracles arose in Christian theology in the time of the schoolmen with the sharp demarcation between the natural and the supernatural. A philosophical conception of miracle arose as that which is apart from nature. The popular interpretation was an event contrary to nature, and the popular inference was that the more opposed to nature a miracle might be, the more it was evidence of the supernatural. These ideas passed into Protestantism and have colored much of the use of miracles as Christian evidence. The Church of the Middle Ages held that miracles still took place, though some of the schoolmen, as Abélard, freely criticized accounts of particular miracles. This belief in the continuance of the power of miracle has continued in the Roman Catholic church, which has always held evidence of miraculous power to be a prerequisite to the canonization of a saint. The Protestant church has usually rejected postbiblical miracles, regarding the function of miracle to be the attestation of the divine truth of the special revelation of God in the biblical periods.

In the history of the discussion, different definitions of miracle have been given.

1. That it is a violation of a law of nature by a volition of the Deity. This is the definition which Hume used. Hume's famous argument against miracles is that all knowledge rests upon experience; but experience confirms the order of nature, and miracles are so contrary to all experience that it is more reasonable to disbelieve any testimony about them than to believe a miracle. John Stuart Mill, *Essays on Theism*, asserts that, if a miracle could happen, it would be impossible to prove it. The common answer to this position has been that the possibility of events is not limited to usual past experience, and therefore that it is impossible to prove that miracles cannot take place. Spinoza held that "nothing happens in nature which is in contradiction to its universal laws," and, since miracles are contradictions to law, they are impossible. This has been met by saying that miracles are contrary to nature only if nature is taken as a mechanism.

2. The definition of a miracle as contrary to nature is neither biblical nor in accord with the best theological thinking. Augustine held that

miracles are not against nature, but only against nature as we know it. Miracles have been defined as events not explained by the known laws of nature. It is in accordance with this that various fields, once considered miraculous, have been removed from the field of miracle by the fuller understanding of natural law—dreams, the thunder, eclipses, trances and visions, many kinds of healings. This definition admits the reality of the biblical miracles and says that, if we knew the laws of nature better, we should doubtless find explanation for them all. This position is sometimes taken from a religious point of view, conceiving that an all-wise God, in constructing the universe, must have so arranged things that all events which happen fall into their place as parts of an ordered and harmonious whole.

3. An element of religious purpose has nearly always entered into the Christian definition of miracles. A mere wonder is not a miracle. It must have a religious significance. If, to use Arnold's illustration, the pen should turn into the penwiper, it would be a very strange event, but its religious significance is not obvious, and it would not be a miracle. On the other hand, if the crossing of the Red Sea were effected by means of a wind, at the will of God, for a religious purpose, it would still be a miracle. Whenever God so orders affairs that an extraordinary event fulfills a religious purpose in life, that event may be called miraculous, even if its immediate cause is the operation of natural law.

4. A definition of miracle is sometimes given which extends it beyond the biblical miracles, or those in ecclesiastical history, to all direct spiritual action of God. Miracle is God's direct action in the world of matter or of mind. On this basis it is held that the Christian religion is miraculous, not merely because of events in Christ's life, but because it is the field of the direct action of God. Conversion, the life of prayer, the communion of God with man, the grace which enables man to combat sin, are all miraculous. It is certainly true that the historic doctrines of grace and redemption make Christianity an essentially miraculous religion.

In the modern world there have been two stages of the discussion of miracles: one under the influence of the growing sense of a natural order, which produced the objections to miracles raised by the English deists, Hume, and the French and German rationalists; the other under the influence of the modern scientific conception of the uniformity of law, expressed by the doctrine of evolution and the historical study of religion. The older objections of Hume and his contemporaries are no longer of importance. The conceptions upon which both these objections and the answers rest have been displaced by modern science. The insight into the inexhaustible complexity of nature has made men more modest in asserting what may or may not be possible, or to be sure that all the causes of any event have come into view. At the same time the sense of an ordered universe has become stronger, and the older idea of a miracle as the action of God thrusting His hand into the moving machinery of His world seems to debase the conception of God. A growing spiritual sense has also led to the emphasis on the moral and religious as evidence of the revelation and power of God. The value of miracles as evidences of the divine character of the biblical revelation because they were events

only explicable by the power of God has been very much diminished. Miracles merely as acts of power have no religious significance. They are external; modern religion demands evidences within the personal experience. The result is that, while 100 years ago miracles were considered one of the great proofs of the Christian religion, they are to-day rather burdens than helps. Theology holds the possibility of miracles; for the most part it holds that some at least of the biblical miracles happened; it holds that they were evidences for religion at the time they occurred, but that they belong to the lower grade of evidences, and that the moral and spiritual proofs of religion are higher and more valuable.

But to assert that miracles may happen is not to claim that they did happen. The critical study of the Bible has introduced a new problem: how far are the narratives of miracle in the Bible to be taken as statements of fact? Certain classes of miracles will be set aside: those in books held to be fiction; those in apocalyptic literature, where miraculous visions are a part of the literary form; those told in legendary folk tales; and those where a miraculous cause is assigned for what we now see may have been a natural event. The principles of criticism must be allowed the same play in the New Testament as in the Old, but the nearly contemporaneous character of the writing of the New Testament and the abundant evidence they contain of belief in a large body of miraculous healings forbid the treatment of them as wholly legend. Many who are critical of the Old Testament narratives and of certain accounts in the New yet hold that Christ had a unique power which manifested itself naturally in miracles of benevolence, like healings and even raising from the dead. To such persons Christ himself is the great miracle, and his miracles are not mere wonders, but manifestations of his own character. The present tendency, however, is to remove attention from the miracles and centre it upon Christ's character. Historical criticism even claims the right to question, and if necessary to reject, the narratives of Christ's miraculous birth and resurrection without disloyalty to the essential principles of his religion; a claim, however, which is not always acknowledged by conservative theology. Christian thought is not entirely at one regarding the place of miracles in Christian belief. Some hold that the belief in miracle is a necessary and fundamental part of Christian doctrine; others that it is unessential, that it belongs to the interpretation of nature rather than to the realm of spiritual truth, and that Christian belief does not require the acceptance of miracles as the term is understood in historic theology.

MIRACLE WORKER. See GREGORY THAUMATURGUS.

MIRA DE AMESCUA, mē'rà dâ á-mâs'kwâ, ANTONIO (?1578-1644). A Spanish dramatist. Born at Guadix, he took orders, obtained a canonry in his native town, and settled in Madrid early in the seventeenth century. In 1610 he had become archdean of Guadix. He accompanied the Count of Lemos to Naples, and on his return in 1619 was appointed chaplain to the Cardinal Prince Ferdinand of Austria. He early attained distinction as a dramatist, for he is mentioned as such by Rojas Villandrando in his *Loa* (Madrid, 1604), which was written late in 1602 or early in 1603. Mira de Amescua's plays are few, but of even execution, a combination not often found among Spanish writers and one which invites comparison with Alarcón. They were influential at home and abroad. The lack of a good edition of Mira's complete works is responsible for his not being better known to-day.

Bibliography. *Biblioteca de autores españoles*, vol. xlii (2d ed., Madrid, 1875), contains *poesías*; id., vol. xlv (2d ed., ib., 1881), contains five *comedias*; H. A. Rennert, "Mira de Mescua et La Judia de Toledo," in *Revue Hispanique*, vol. vii (Paris, 1900); *Comedia famosa del Esclavo del Demonio*, edited by M. A. Buchanan (Baltimore, 1905); Cristóbal Pérez Pastor, *Bibliografía Madrileña*, part iii (Madrid, 1907); T. G. Ahrens, *Zur Charakteristik des spanischen Dramas im Anfang des XVII. Jahrhunderts* (Halle, 1911).

MIRAFLORES, mē'râ-flô'râs, MANUEL PANDO FERNÁNDEZ DE PINEDO MACEA Y DÁVILA, MARQUIS OF (1792-1872). A Spanish statesman and historian, holding also the title of Count of Villapaterna. He was born at Madrid, was sent as Ambassador to London in 1834, and was Ambassador at Paris in 1838-40. In 1846 he was Premier and in 1863 again filled the same office. He was Ambassador to Vienna in 1860 and was several times President of the Senate. He wrote

a number of works which are of value for the political history of Spain in the nineteenth century. The most important is the *Memorias para escribir la historia de los siete primeros años del reinado de doña Isabel II* (1843). In addition to many of the most highly esteemed of the Spanish decorations for distinguished service he was Grand Officer of the French Legion of Honor. He was also elected a member of the Royal Academy of History at Madrid.

MIRAGE, mī-rāzh' (Fr., from *mirer*, to gaze). A phenomenon extremely common in certain localities and due to conditions existing in the atmosphere. As a result of a deviation of the rays of light caused by refraction and reflection, objects seen with the eye appear in unusual positions and often multiple or inverted. One cause of mirage, such as occurs in a desert, is a diminution of the density of the air near the surface of the earth, often produced by the radiation of heat from the earth, the denser stratum being thus placed *above* instead of, as is usually the case, *below* the rarer. Now, rays of light from a distant object, situated in the denser medium (i.e., a little above the earth's level), coming in a direction nearly parallel to the earth's surface, meet the rarer medium at a very obtuse angle, and (see **LIGHT**) instead of passing into it they are reflected back to the dense medium, the common surface of the two media acting as a mirror. The image produced by the reflected rays will appear inverted and below the real object, just as an image reflected in water appears when observed from a distance. If the object is a cloud or portion of sky, it will appear by the reflected rays as lying on the surface of the earth and bearing a strong resemblance to a sheet of water; also, as the reflecting surface is irregular and constantly varies its position, owing to the constant communication of heat to the upper stratum, the reflected image will be constantly varying and will present the appearance of a water surface ruffled by the wind. This form of mirage is of common occurrence in the arid deserts of Lower Egypt, Persia, Turkestan, etc. In the case of mirage at sea the denser layers of air are next to the surface of the water, and the reflection takes place from the rarer atmosphere above. Consequently we have the object appearing in the air suspended and inverted. Sometimes images of objects are seen not above one another, but side by side, caused by the existence of bodies of air of different densities in proximity.

In particular states of the atmosphere reflection of a portion only of the rays takes place at the surface of the dense medium, and thus double images are formed, one by reflection and the other by refraction—the first inverted and the second erect. The phenomena of mirage are frequently much more strange and complicated, the images being often much distorted and magnified and in some instances occurring at a considerable distance from the object, as in the case of a tower or church seen over the sea or a vessel over dry land, etc. The particular form of mirage known as looming is very frequently observed at sea and consists in an excessive apparent elevation of the object. Consult Müller, *Lehrbuch der kosmischen Physik* (Brunswick, 1896).

MIRAMAR, mē'râ-mār'. An Imperial palace and public pleasure resort on the Gulf of Triest, 6 miles northwest of Triest (q.v.).

MIRAMICHI (mīr'â-mé-shē') **RIVER.** The

second largest river in New Brunswick, Canada. It is formed by the junction of the northwest and southwest Miramichi (Map: New Brunswick, C 2). It flows, after a course of about 100 miles, into the Bay of Miramichi, a part of the Gulf of St. Lawrence. Pine woods abounding with game line the banks of the river, which is navigable for vessels of modern size for a distance of 40 miles from its mouth. The fishing is excellent, salmon and trout abound, and there is a state fish-breeding establishment on one of the tributaries.

MIRAMÓN, mē'rā-mōn', MIGUEL (1832-67). A Mexican general, of French descent, born in the city of Mexico. He was educated for the army and fought against the United States at Molino del Rey and Chapultepec. He saw much active service during the fifties and was promoted to be a lieutenant colonel in 1855. He was one of the leaders of the opposition to Comonfort (q.v.) in 1856 and supported Zuloaga, the representative of the clerical and reactionary party, in the movement which forced Comonfort to retire to the United States in 1858. Later in the same year he was chosen acting President by a *Junta de Notables*, but, contrary to the expectations of the junta apparently, he turned the office over to Zuloaga and assumed the conduct of the campaign against the Liberals, led by Juárez. Returning to the capital, he was again installed as acting President, exercising its duties until December, 1860, when his defeat by Juárez at Calpulalpam forced him to leave the country. He spent some time in Europe and advocated foreign interference in Mexican affairs. He reappeared in Mexico in 1866, after the announcement that the French army was to leave the country, and offered his services to Maximilian. Raising an army in the West, he joined the Emperor at Querétaro, where he was wounded during the final struggle with the republican forces. He was tried and condemned to be shot with the Emperor on June 19, 1867. As they were lined up for the execution, Maximilian insisted that Miramón should take the place of honor in the centre, as a tribute to his bravery.

MIRANDA, mē-rān'dā. A Portuguese poet. See *SÁ DE MIRANDA*, FRANCISCO DE.

MIRAN'DA, mī-rān'dā. In Shakespeare's *Tempest*, Prospero's daughter and the ladylove of Ferdinand.

MIRANDA, mē-rān'dā, FRANCISCO (?1756-1816). (Miranda's own statements would indicate that he was born in 1752; his lawyer Chauveau Lagarde asserts the date was 1754; a baptismal certificate published by Blanco bears the date 1756.) A Spanish-American revolutionist, who was born in Venezuela and entered the Spanish army, rising to the rank of captain. He resigned in order to serve with the French in the United States. He was then sent to Cuba, where he engaged in illegal trade and was obliged to take refuge in Europe. The French Revolution called forth his enthusiastic admiration. He served in the French Republican army and gained the rank of major general. The defeat at Neerwinden (1793) was attributed largely to his treachery, and the suspicion led to his arraignment before the Revolutionary Tribunal, which unanimously acquitted him. Later in the same year he was again arrested and placed in prison, where he was kept without trial for a year and a half. After the fall of the Girondists he fled to England and endeavored in vain to

induce William Pitt to aid him in an attempt to free Venezuela from the Spanish dominion. In 1803 he went to New York, where he found means to fit out two vessels and some 200 volunteers, with whom he sailed for South America in 1806. The great popular demonstration in his favor which he had expected was entirely lacking. In 1810 he organized another expedition and took possession of Valentia, Puerto Cabello, and nearly the whole of New Granada. Miranda organized a revolutionary government, proclaimed a constitution, made himself Vice President, and entered Carácas in triumph in April, 1812. The members of the government were not able to act in harmony. Miranda was taken prisoner by the opposition faction of revolutionists in July and shortly afterward fell into the hands of the Spanish authorities, by whom he was sent to Spain. He died in the dungeons of the Inquisition at Cadiz three years later. Consult: Biggs, *History of Miranda's Attempt in South America* (London, 1809); Marqués de Rojas, *El General Miranda* (Paris, 1884); id., *Miranda dans la révolution française* (Carácas, 1889); the Spanish edition of this latter work (ib., 1889) contains a few additional source materials; also W. S. Robertson, *Francisco de Miranda and the Revolutionizing of Spanish America* (Washington, 1909).

MIRANDOLA, mē-rān'dō-lā. A town in the Province of Modena, Italy, 19 miles north-northeast of the city of Modena (Map: Italy, C 2). The little town is regularly laid out. The old Ducal Palace of the Pico family, the cathedral, and the church of Gesù are the most important buildings. It has a gymnasium, a technical school, and a library. The principal industries are cattle raising and the production of silk and rice. Pop. (commune), 1901, 13,731; 1911, 16,740.

MIRANDOLA, GIOVANNI PICO DELLA. An Italian humanist. See *PICO DELLA MIRANDOLA*.

MIRANHA, mī-rā'nyā. See *MARANHA*.

MIRAT, mē'rūt. See *MEEHUT*.

MIRAVAL, mē'rā'vāl', RAIMON DE (c.1190-1216). A Provençal poet. His poverty compelled him to subsist on the favor of the great lords at whose courts he seems to have passed most of his time. His chief patron was Raimon VI of Toulouse, addressed in his poems by the name Audiart. Consult Andraud, *La vie et l'œuvre du troubadour Raimon de Miraval* (Paris, 1902).

MIRBACH, mēr'bāg, JULIUS, COUNT VON (1839-). A German politician, born in Sorquitten, East Prussia. He studied law at Königsberg, Bonn, and Berlin and served as officer in the German army, resigning in 1865. In 1874 he entered the Prussian House of Lords and in 1878-81 and 1886-98 was a member of the Reichstag and a prominent figure in the German Conservative party, taking a foremost part in economic and agrarian reforms, acting as leader of the *Steuer-und Wirtschaftsreformer* (1879 et seq.). He was created Count in 1888.

MIRBEAU, mēr'bō', OCTAVE (1850-1917). A French novelist and playwright, born at Trevières (Calvados). After a stormy journalistic career he published his first novel, *Jean Marcelin*, in 1885, but gained note with *Lettres de la chaumière* (1886), a tale of his native Normandy. There followed *Le Calvaire* (1886); *L'Abbé Jules* (1888; in Russian, 1912); *Sébastien Roch* (1890); *Le jardin des supplices* (1899); the exceedingly unsavory and very

popular *Les mémoires d'une femme de chambre* (1901; in English, *Experiences of a Lady's Maid*, 1911); *Les vingt-et-un jours d'un neurasthénique* (1902); *Le jardin des supplices* (1902); *Dans l'antichambre* (1905). He was successful on the stage with *Les mauvais bergers* (1897), and still more with *Les affaires sont les affaires* (1903), produced with great success in New York in 1905 as *Business is Business*. A number of one-act plays are contained in *Farces et moralités* (1904). In 1909 he wrote *Le foyer*, which was suppressed by the censor, and in 1913 *Dingo*.

MIRBEL, mèr'bèl', CHARLES FRANÇOIS BRISSEAU DE (1776-1854). A French botanist, born in Paris. In 1800 he began a botanical course at the Athénée and in 1803 he was made intendant of the Malmaison Gardens. In 1806 he was made a councillor of state at the Dutch court of Louis Bonaparte, and as director of fine arts he was charged with the mission of organizing a school in Paris for Dutch artists. In 1808 he became a member of the Institute. He was professor of culture at the Botanical Garden (1828) and at the Museum of Natural History (1829). His great contributions to structural botany are recorded in his works: *Traité d'anatomie et de physiologie végétale* (1802); *Exposition de la théorie de l'organisation végétale* (1809); *Éléments de botanique et de physiologie végétale* (1815); *Histoire naturelle des végétaux classés par familles* (18 vols., 1802-26).

MIRBT, mērp't, CARL THEODOR (1860-). A German Church historian, born at Gnadenfrei in Silesia. He was educated at the universities of Halle, Erlangen, and Göttingen; was docent at Göttingen for a year; and then was professor of ecclesiastical history at Marburg from 1889 to 1912, when he went back to Göttingen. His published work, which deals with the Roman Catholic church and with the history of Protestant missions, comprises: *Die Wahl Gregors VII.* (1892); *Die Publizistik im Zeitalter Gregors VII.* (1894); *Der deutsche Protestantismus und die Heidenmission im 19. Jahrhundert* (1896); *Quellen zur Geschichte des Papsttums und des römischen Katholizismus* (1895; 3d ed., 1910); *Ultramontanismus im 19. Jahrhundert* (3d ed., 1903); *Mission und Kolonialpolitik in dem deutschen Schutzgebieten* (1910); *Die Frau und die deutsche Kolonialmission* (1912); *Geschichte der katholischen Kirche von der Mitte des 18. Jahrhunderts bis zum Vatikanischen Konzil* (1913).

MIRÉS, mè-rá', JULES (1809-71). A French financier and speculator. He was born at Bordeaux. In company with Moïse Millaud he began to buy up the press of Paris; he purchased the *Chemins de Fer* and afterward the *Constitutionnel* and *Le Pays*. He published independently the *Conseiller du Peuple*. Swaying public opinion in this manner, he organized the *caisse générale des chemins de fer*, or railway bank, began to build railroads in Spain and elsewhere, negotiated municipal and national loans, and acquired an immense fortune. During the last four years of his career his speculations amounted to 1,500,000,000 francs. Arrested for fraud in 1861 he was condemned to imprisonment, but was acquitted in 1862 after an appeal. He resumed banking operations, but people came to distrust his promises of magnificent possibilities. He was a man of infinite resources, quick to plan, daring to act,

carrying out his immense coups by gigantic combinations, overcoming all opposition by the plentiful use of money and with the help of his hired journalists and politicians. He published in 1870 *Un crime judiciaire*, and carried on a lively war of pamphlets with his enemies.

MIRFIELD, mēr'fēld. A manufacturing town and urban district in the West Riding of Yorkshire, England, 5 miles northeast of Huddersfield, on the Calder, one of the chief railway centres in the country. It has manufactures of woolen and cotton goods, carpets, and blankets. There are coal mines near by. Pop., 1901, 11,341; 1911, 11,712.

MIR'AM. The sister of Moses and Aaron. She is called a "prophetess" and is represented as celebrating the deliverance of the people from Egypt as the leader of a female choir (Ex. xv). Apart from this, she is mentioned again only in connection with Aaron's rebellion against Moses, in which Miriam stands on Aaron's side. She is smitten with leprosy as a punishment (Num. xii), but after seven days' isolation (Lev. xiii. 5) is healed by Yahwe at Moses' solicitation. Her death takes place at Kadesh (Num. xx. 1). Miriam, though not expressly named, is thought to be the sister referred to in the story of Moses' infancy (Ex. ii), who acts as a nurse and protector to him. The name may be connected with Merari, one of the sons of Levi (Ex. vi. 16). It has been suggested that Aaron and Miriam represent priestly families vying with that of Moses, that the latter prevailed, but that a compromise was effected, showing itself in the later tradition. The association between Moses, Aaron, and Miriam once established is supposed to have given rise to further elaboration which was adjusted to the general priestly narrative in the Pentateuch. The allusion in Micah vi. 4 to "Moses, Aaron, and Miriam" as the forerunners in the redemption of Israel is thought by some scholars to be a valuable indication of the period at which the combination of the three in popular tradition and legend had taken place.

MIRIBEL, mè-rè'bèl', MARIE FRANÇOIS JOSEPH DE (1831-93). A French general. He was born at Montbonnot, studied at the Ecole Polytechnique and at the Military Academy of Metz, and in 1853 was commissioned a lieutenant of artillery and sent to the Crimea. He fought in Italy in 1859 and in Mexico (1862-65); served on the international commission dealing with the use of explosive bullets; and in 1868 was appointed military attaché in St. Petersburg. Miribel fought bravely at Champigny and Buzenval in the Franco-Prussian War; commanded a corps of artillery against the Commune; and from 1877 to 1879 was chief of the general staff. His reappointment by Gambetta to this post in 1881 created great excitement, and he resigned after the fall of Gambetta's ministry. In 1888 he was commanding general of the Sixth Army Corps. In 1890 he was once more made chief of staff with greater powers than before, and showed himself an able administrator.

MIRIM, mè-rēn'. A lake or lagoon in the extreme south of Brazil, on the boundary of Uruguay (Map: America, South, D 6). It is 130 miles long and from 5 to 25 miles wide, and is separated from the Atlantic Ocean by a low sandy tract from 15 to 40 miles wide, containing several true coast lagoons. It receives a number of small rivers from the west, and,

though its shores are low and marshy, it is not in direct communication with the ocean, but discharges its waters northward into the Lagôa dos Patos (q.v.). Like the latter, it was evidently formed through the cutting off by sand bars of a large bay of the ocean. The water of Lake Mirim is fresh, and there is no rise or fall of the tides in it.

MIRITI (mé-rê'tê) **PALM**. See MAURITIA. **MIRKHOND**, mîr-kônd', HAMAN ED DIN (1433-98). A distinguished Persian historian, born of Sayyid descent from a Bokharan family probably near Nishapur. About 1474, under the patronage of Mir Alishir, Mirkhond began his historical work, entitled *Rauzat-us-ṣafâ* (Garden of Purity). It is of great value and, on the whole, is a very remarkable compilation, being, save for the seventh volume, which deals with the latter part of the fifteenth century and must have been by Mirkhond's son, Khondamir (1475-1535), the work of a single man. Beginning with mythical times, the *Garden* contains biographical notices of the leading Persian notables down to 1523. The part on the early kings was translated by Shea (London, 1832); that on the Sassanids, into French by S. de Sacy (Paris, 1793) and Jaubert (ib., 1843); on the Samanids, into Latin by Wilken (Berlin, 1808) and into French by Defrémery (Paris, 1845); on the Seljuks, by Vullers into German (Giessen, 1837); and the story of Mohammed by Rehatsek into English (5 vols., London, 1891-94) and from English into French by Lamairesse (Paris, 1894).

MIRMILLO'NES. The name given by the Romans to a kind of gladiator (q.v.).

MIR'ROIR (OF. *miroir*, *mirour*, Fr. *miroir*, It. *miratore*, *miradore*, from Lat. *mirari*, to look, from *mirus*, wonderful; connected with Gk. *μειδάω*, *meidan*, Skt. *smi*, to smile). An object having a smooth or polished reflecting surface by which virtual or real images of an object are produced, and the direction of light or heat waves changed according to the laws of reflection. Mirrors are used largely for toilet and decorative purposes, and also in scientific apparatus and in numerous other practical devices to concentrate, scatter, or divert rays of light or heat, as in practical illumination. The action of the mirror depends on the law of reflection where it is stated that the angle of reflection must equal the angle of incidence and be in the same plane. This optical principle was well known to the ancients and was doubtless long preceded by an actual practical knowledge of the instrument. Probably for ages after the civilization of man commenced the still waters of ponds and lakes were the only mirrors. We read in the Pentateuch of mirrors of brass being used by the Hebrews, while it is known that mirrors of bronze were in very common use among the ancient Egyptians, Greeks, and Romans, and many specimens are preserved in museums. Praxiteles taught the use of polished silver for mirrors in the year 328 B.C. and polished mirrors of obsidian or natural glass were used by the Romans.

Mirrors of glass were first made at Venice in 1300; and judging from those still in existence they were very rude contrivances compared with those of modern make.

It was not until 1673 that the making of mirrors was introduced into England, and the industry has since developed in Europe and America to a point where it is a very important

manufacture; and mirrors can be produced of any size to which plate glass can be cast.

For many centuries mirrors were made according to the process originally introduced at Venice—by backing a sheet of glass with an amalgam of mercury and tin. The surface was overlaid with sheets of tin foil, rubbed down smooth, and the whole covered with quicksilver, which immediately formed an amalgam with the tin. The superfluous mercury was then run off and a woolen cloth held firmly over the surface by means of iron weights. After this pressure had been continued 24 hours, more or less, the weights and cloth were removed and the glass placed on a table with a movable top, which was gradually inclined until the unamalgamated quicksilver had entirely drained away and only the surface of perfect amalgam remained adhering to the glass. This process, which was long used, was open to many objections, not least of which was its extreme unhealthfulness for the workmen. The process was also long and tedious, and at best made an unsatisfactory mirror, reflecting less than half the rays of light.

The first attempt to back the glass with silver was made by Liebig in 1836, and different solutions were proposed by other chemists, all of which produced mirrors that were satisfactory for a short time but finally became spotted. In 1855 Pettitjean patented a process which, with various modifications, is the one now in general use. The method of mirror manufacture common in America may be described as follows: The raw stock or plain plate glass reaches the factory carefully packed in cases of immense size. The glass is first thoroughly inspected and all defects marked. It then goes to the cutters' department, where it is cut into the proper sizes. Thence it is moved to the beveling department, where it is beveled and polished on rapidly revolving emery wheels of varying degrees of smoothness, the plates—some of them of enormous size—being lightly held against the wheel by the workmen. After both surfaces, including the beveled edge, have been reduced, as nearly as possible, to a condition of perfect smoothness, the glass is passed on to the silvering department. Here it must be thoroughly cleansed, and so delicate is this operation that a specially distilled water is often required for the purpose. The glass is now ready for the essential process of silvering. The nitrate of silver is dissolved in water, to which ammonia is then added, and is precipitated by a solution of Rochelle salts or tartaric acid. The glass is placed on warm tables and the solution poured over it. The heat helps the silver to precipitate and adhere to the glass. The silver back receives a coat of shellac and then of paint or of asphaltum varnish containing white lead, which completes the process. Silvered mirrors reflect from 20 to 25 per cent more of light than those backed with quicksilver.

The optical considerations involved in reflection will be found fully discussed together in the article on LIGHT, but brief mention may here be made of mirrors whose reflecting surfaces are other than plane. In a concave spherical mirror we have distant rays of light or heat brought to a focus and a real image formed. Conversely, if a point source of light is placed at the focus of the mirror, a parallel beam of light results. The first idea is made use of in the reflecting telescope (see TELESCOPE), while the

latter is employed in the searchlight (q.v.), recent types of which have been made with a gold reflecting surface.

A *parabolic mirror* is one "in which every section through the principal axis cuts the surface in a parabola, so that rays from a light placed at the focus are all reflected parallel to the axis and, conversely, parallel rays are brought to the focus." The reflector of a locomotive headlight is thus constructed. See **ABERRATION, SPHERICAL; LIGHT.**

Cylindrical mirrors do not play as important a part in optics and optical instruments as those of spherical and parabolic cross section, but their effects are sometimes interesting. By using a glass that is curved instead of flat the reflected shape of the object will become distorted, a *concave* cylindrical mirror lengthening it at the expense of width and a *convex* mirror producing the opposite effect.

As heat is reflected as well as light from the surface of a mirror, a concave mirror may be used to bring rays of light to a focus. In this way combustible substances may be set on fire at a distance from the reflector whence they receive their heat. The *Archimedean mirror* was made on this plan. A series of mirrors set in a concave curve concentrated the rays of light upon an enemy's ship, causing it, according to the story, to burn.

MIRROR CARP. An artificial variety of carp (q.v.) with very large scales in two or three rows along the sides of its body, which is otherwise bare.

MIRROR FOR MAGISTRATES, A. A long series of poems on incidents in English history showing the tragedies in the lives of great men. The plan was suggested by Boccaccio's *Falls of Illustrious Men* and Lydgate's *Falls of Princes*, and was devised by William Baldwin, George Ferrers, and Sackville, who wrote a general introduction called the "Induction." It was partly printed in 1555, when it was stopped by Lord Chancellor Gardiner. It was licensed, however, in 1559, and then contained 19 metrical biographies, beginning with Tressillian in Richard II's reign. New editions, with additional lives by various writers, appeared in 1563, 1574, 1578, 1587, and 1610, and a reprint of the whole by Haslewood in 1815. Some of the best-known contributors are Michael Drayton, Thomas Churchyard, John Skelton, and Thomas Sackville, whose "Induction" and "Complaint of Stafford, Duke of Buckingham," are the most valuable parts of the work.

MIRROR OF KNIGHTHOOD, THE. A translation of a Spanish romance, *Cavallero del Febo* (The Knight of the Sun), which tells the adventures of Febo and his brother Rosiclaire. It belongs in a sense to the Amadis cycle of romance, as the father of the Knight of the Sun was related to Amadis. The Spanish version was evidently the work of several and was left unfinished. The translation of the romance into English was printed in 1578. See Dunlap's *History of Prose Fiction*.

MIRTOV. See LAVROV, P. L.

MIRYACHIT, mēr-yā'chit. An Oriental nervous affection, the chief peculiarity of which is mimicry. The patient imitates words and actions said or done by his immediate neighbor. In Java the disease is called *lata*. The jumpers of Canada and Wales are thought to be afflicted with a similar disease. See **JUMPERS.**

MIRZA, mēr'zā (Pers. *mirzā*, contracted from

Amir Zādeh, son of the prince). A Persian title. As a prefix preceding the surname of the individual it is a common Persian title of honor, but when annexed to the surname it designates a prince or a male of the blood royal.

MIRZAPUR, mēr'zā-poor'. The capital of a district of Benares, in the United Provinces, British India, on the right bank of the Ganges, 30 miles southwest of Benares (Map: India, D 4). It is a well-built city, the river front is lined with a series of fine landing places, and there are many mosques, temples, and residences of rich European merchants. It is noted for its manufactures of carpets and rugs and has large brass and shellac factories. Prior to the opening of the railway to Allahabad it was the largest cotton and grain trading centre on the Ganges and the converging market of north and Central India. Pop., 1901, 66,071; 1911, 32,332.

MIRZA SCHAFFY, mīr'tsā shāf'ē. See BODENSTEDT, FRIEDRICH MARTIN VON.

MISANTHROPE, mē'zān'trōp', LE. A comedy by Molière (1666) based on a study of character rather than on incidents. It is considered Molière's masterpiece and shows his style at its highest development.

MISCARRIAGE. In the broadest sense, a breach of legal duty. This is the signification of the term as employed in the fourth section of the English Statute of Frauds and in similar statutory provisions in the United States, which, in order to make a person liable to answer for the debt, default, or miscarriage of another person, require a special promise in writing.

In medical jurisprudence the term "miscarriage" is sometimes employed as the equivalent of abortion as denoting the premature expulsion of the fœtus before it becomes capable of an independent life. The act of causing miscarriage or abortion in a pregnant woman except for the purpose of preserving her life is a crime at common law and by modern statutes. See **ABORTION.**

MISCEGENATION, mīs'ē-je-nā'shūn (from Lat. *miscere*, to mix + *genus*, race). Mixing of races; usually restricted to amalgamation of Caucasian and African races in America. The expression came into common use in discussions of negro slavery in the United States towards and after the middle of the nineteenth century, when certain publicists advocated the gradual absorption of the blacks by intermarriage with whites. The expression is seldom employed in scientific discussion of racial problems, such collocations as mixing of races, blood blending, etc., taking its place. The process so denoted is of much importance—indeed, one of the primary factors of human development, as is shown by the fact that the most advanced peoples are those whose blood is most mixed. The process of racial assimilation is going on in every part of the world and with progressively increasing rapidity. Even in the United States, despite the most strenuous opposition on both national and sentimental grounds, the admixture of whites and blacks has gone so far that among the 9,000,000 enumerated as colored in the census of 1900, the population of pure-blooded Africans is comparatively small, while the admixture of red and white races has affected a proportion of the population which may be estimated at 30 to 60 per cent of the element reckoned as Indian. The data are too meagre to indicate the vital value of the mestizo type in the United States,

though the experience of Mexico suggests that the value is high. The more general aspects of racial blending are discussed under MIXED RACES. Consult C. B. Davenport, *Heredity of Skin Color in Negro-White Crosses*, Carnegie Institution (Washington, 1913). See CROSS BREEDING IN MAN.

MISCHIANZA, mîs'kê-ân'tsà, THE. An elaborate fête or entertainment given at Philadelphia, May 18, 1778, during the Revolutionary War, by officers of the British army, in honor of Sir William Howe, who, having been superseded in the command of the British army in America by Sir Henry Clinton, was about to sail for England. The entertainment, which was given at Walnut Grove, the country seat of Thomas Wharton, lasted 12 hours and comprised a regatta, a mock tournament between the Knights of the Blended Rose and the Knights of the Burning Mountain, a dance, and a dinner. Captain (later Major) André was prominent in planning and directing the entertainment and wrote a detailed description, which may be found in Winthrop Sargent, *Life of Major André* (New York, 1902). Consult also J. F. Watson, *Annals of Philadelphia* (Philadelphia, 1856).

MISCHIEF, MALICIOUS. See MALICIOUS MISCHIEF.

MISDEMEAN'OR (from *mis-* + *demeanor*, from *demean*, from OF. *demener*, *deminer*, to manage, from Lat. *de*, down + *minare*, to lead, drive). The name given by English common law to every crime below the grade of felony (q.v.). By the common law, the offense of greatest enormity is treason, and the least is misdemeanor. The original distinction between felony and misdemeanor consisted in the consequences of a conviction. A party convicted of felony, if capital, forfeited both his real and personal estate; if not capital, his personal estate only. A party convicted of misdemeanor forfeited none of his property. The distinction is not kept up between the two classes of crimes by any greater severity of punishment in felony, for many misdemeanors are punished as severely as some felonies. But it has been the practice of the Legislature, when creating new offenses, to say whether they are to be classed with felony or misdemeanor; and when this is done, the above incidents attach to the conviction accordingly, in the absence of legislation to the contrary.

Misdemeanor, in the United States, does not include, in its legal application, offenses against police regulations, city by-laws, and the like, though, in common language and in some statutes it may extend to any misbehavior. It is evident that what is a statute felony in one State may be a misdemeanor in another, and it is therefore impossible to give a complete classification of such offenses. They may be crimes against public justice, peace, health, or trade; against personal or property rights of individuals; or may be mere attempts and solicitations.

In some States it is provided that upon acknowledgment of satisfaction by the injured party, in such cases as assault and battery or malicious mischief, the criminal proceeding shall, with the consent of the magistrate, be dropped—a course which, obviously, would be improper in dealing with felonies. Misdemeanors are usually punishable by fine or by imprisonment for a comparatively short term, as from a month to a year, or by both, and are not rated as in-

famous crimes. See CRIME; FELONY; CRIMINAL LAW.

MISENO, mē-zā'nō (Lat. *Misenum*), CAPE. A promontory projecting into the Bay of Naples on the northwest and connected with the mainland by a narrow strip of coast, 9 miles southwest of Naples, 3 miles from the ancient Baia (Map: Italy, F 1). On the outskirts of the promontory are the scanty ruins of the ancient city of Misenum, including the Piscina Mirabilis, a huge reservoir with a well-preserved vaulted roof, supported by pillars, the Grotto Dragonara, a subterranean vaulted structure, of uncertain use, a theatre, baths, villas, and inscriptions. Misenum was made by Augustus the naval station for a division of the Roman fleet, and for that purpose a great harbor with three basins was constructed, of which the inner is now a lagoon, the Mare Morto. The town was destroyed by the Saracens in 890 A.D. Consult J. Beloch, *Campanien* (2d ed., Breslau, 1890).

MISENUM. The ancient name of MISENO.

MISE OF AMIENS, mēz ov á'mé'ân' (OF., Fr. *mise*, putting, expense, judgment, from Lat. *mittere*, to send). The name given to the decision of Louis IX of France, delivered as arbitrator between Henry III of England and his barons on Jan. 23, 1264. All points in dispute were decided in favor of Henry, and the Provisions of Oxford (q.v.) were specially annulled. See MONTFORT, SIMON DE; HENRY III.

MISE OF LEWES, lū'is. The name given to the capitulation of Henry III of England after the battle of Lewes, in which on May 14, 1264, the barons defeated and captured him. This treaty greatly limited the royal power, and upon it Simon de Montfort sought to establish a new constitution for England. See MONTFORT, SIMON DE; HENRY III.

MISÉRABLES, mē'zà'rà'bl', LES. A noted romance by Victor Hugo, begun in 1846, but interrupted by the author's political activity. It was completed during Hugo's stay in St. Peter's, Guernsey, and was published in 1862, the first part appearing simultaneously in Paris, Brussels, London, New York, Madrid, Berlin, St. Petersburg, and Turin. It formed 10 volumes, divided into five parts, entitled *Fantine*, *Cosette*, *Marius*, *L'Idylle rue Plumet*, and *Jean Valjean*. The interest centres throughout on Jean Valjean, a fallen man who achieves his own rehabilitation after long physical and mental suffering and degradation. The saintly Bishop Myriel or Bienvenu is modeled on De Miolles, Bishop of Digne; Marius represents the author's idea of himself in his youth, and the Baron Pontmercy is intended as a sketch of Hugo's father.

MISERERE, mîz'è-ré'rè (Lat., have mercy). The name, taken from its first word, of the Psalm which is the fiftieth in the Vulgate and the fifty-first in the Authorized Version; the principal one of the seven penitential Psalms. It is used on numerous penitential occasions in the Roman Catholic church and forms part of the service for Ash Wednesday in the Anglican Prayer Book. Some of the musical settings of it are famous, especially three which are repeated annually in the Pope's Chapel during the Tenebræ.

MISERERE. A projection on the under side of the seats of the stalls of mediæval churches, chapels, and other ecclesiastical buildings. They are usually ornamented with carved work and are so shaped that when the seats proper are raised they form a support at a higher level to

a person resting upon it. Aged and infirm ecclesiastics were allowed to use these during long services.

MISFEA'SANCE (OF. *mesfaisance*, wrong, from *mesfaire*, *mesferre*, Fr. *méfaire*, to do wrong, from *mes-*, from Lat. *minus*, less + *faire*, from Lat. *facere*, to do). The doing of a lawful act in an improper or negligent manner; contrasted with malfeasance, the doing of a wrongful act, and with nonfeasance, the failure to perform an act which one is under a duty to perform. When misfeasance results in legal damage to a person, it amounts to an actionable tort, although the same act may be a breach of contract also, as when a common carrier injures a passenger by the negligent use of its property or improper conduct of its servants. See TORT.

MISHAWAKA, *mish'á-wá'ká*. A city in St. Joseph Co., Ind., 4 miles east of South Bend, the county seat, beautifully situated on the St. Joseph River and on the Grand Trunk and the Lake Shore and Michigan Southern railroads (Map: Indiana, E 1). It has good water power from the river and is noted as a manufacturing centre, the products including knit boots, wind-mills, rubber goods, plows, veneer, ladders, beer, pipe organs, cement blocks, machine-shop products, automobiles and supplies, aluminium castings, iron beds, curtain stretchers, pearl buttons, felt shoes and slippers, cigars, and leather goods. Among the prominent features of the city are the Orphans Home, hospital, public library, high school, and three fine parks. Three concrete bridges span the river at this place. The government is administered under a charter of 1899, which provides for a mayor, chosen every four years, and a unicameral council. The city operates the water works and electric-light plant. One of the oldest cities in northern Indiana, Mishawaka was settled in 1828 and was incorporated in 1834 as "St. Joseph Iron Works," the change to its present name being authorized by a special Act of the Legislature in 1838. Pop., 1900, 5560; 1910, 11,886; 1914 (U. S. est.), 14,579; 1920, 15,195.

MISH'MIS. The natives of the Mishmi Hills in the valley of the Brahmaputra in northeastern India. By language they are related to the adjacent peoples of Indo-China (Chins, Shans, Lushai, etc.). These primitive tribes are very interesting from a sociological point of view. Among them the custom that the favorite child (without respect to age) inherits prevails. They are herdsmen rather than agriculturalists. Consult: Cooper, *The Mishmee Hills* (London, 1873); Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1872); Crooke, *Natives of India* (1907).

MISH'NA (Heb., teaching, from *shānah*, to repeat, to teach, to learn). A juridico-political, civil, and religious code of the Jews, embodying what is regarded as the oral Law in distinction from the written Law. As such it forms a kind of complement to the Pentateuchal codes, which it explains, amplifies, and immutably fixes in accordance with traditional usage, enforced by the application of the peculiar exegetical methods developed in the rabbinical schools. The Mishnaic laws were subsequently submitted to a process of exposition similar to that which the biblical enactments underwent, and hence there arose, as a supplement to the Mishna, the Gemara (q.v), embodying the discussions on the Mishna by the

rabbis, first of Palestine and then of Babylonia, from the third to the sixth century, when the Mishna and the Gemara had been brought together in the final compilations known as the Palestinian and Babylonian Talmuds. The rabbis whose opinions are given in the Mishna are called Tannaim. They lived at different periods from the Hasmonæan age to the end of the second century A.D. The Mishna, to which again there are apocryphal supplements known as Tosephtas (additions) and Baraithas (extras), which often are of great value, was finally edited, after some earlier incomplete collections, by Rabbi Jehudah, called ha-Nasi (c.200 A.D.) at Tiberias. It is mostly written in late Hebrew, sometimes designated as Neo-Hebraic, and is divided into six portions, or orders (*Sedarim*): (1) *Zeraim* (seeds), on benedictions, agriculture, tithes, etc.; (2) *Moed* (feast), on the Sabbath, festivals, and fasts; (3) *Nashim* (women), on marriage, divorce, laws on the Nazirship, and vows; (4) *Nezikim* (damages), chiefly civil and penal laws, though containing also the ethical treatise *Pirke Aboth*; (5) *Kodashim* (sacred things), sacrifices, etc., description of the temple of Jerusalem, and various other subjects; (6) *Teharoth* (purifications), on pure and impure things and persons. (See further TALMUD.) These are subdivided into 63 tracts or treatises. The Hebrew text of the Mishna was first published in Naples in 1492 with the Hebrew commentary of Maimonides, then at Venice in 1549 with the commentary of Obadiah Bartenora, and often since. The following editions with translation into Latin or modern languages have been mentioned: Surenhusius, *Mischna* (Amsterdam, 1698-1703), containing the Hebrew text of the Mishna, with a Latin translation, and Latin translations of the commentaries of Maimonides and Bartenora; Jost, *Mischna* (Berlin, 1832-34), containing the text, with a German translation in Hebrew characters, and notes; Sampter, *Mischnajoth* (Berlin, 1886 et seq.), vocalized text with German translation and commentary; Hoffmann and Baneth, *Die Mischna* (Berlin, 1900 et seq.), vocalized text with German translation; Albrecht, Holtzmann, Meinhold, Fiebig, Windfuhr, *Die Mischna, Text, Uebersetzung und ausführliche Erklärung* (Giessen, 1913 et seq.); single treatises by Strack with German translation. A German translation was published by Rabe at Onolzbach (1760-63); an Italian translation by Castiglione is in course of publication (1904 et seq.); and 18 treatises of the Mishna were translated into English by De Sola and Raphael (London, 1843) and under the title "The Talmud" by Barclay (ib., 1878). The treatise *Pirke Aboth* was translated by Taylor, *Sayings of the Jewish Fathers* (Cambridge, 1877). Consult also the Introductions to the Talmud by M. Mielziner (2d ed., New York, 1903) and H. L. Strack (Leipzig, 1911); Bacher, *Die Agada der Tannaiten* (vol. i, 2d ed., Strassburg, 1903; vol. ii, 1890); *The Mishna on Idolatry*, edited with translation, vocabulary, and notes by W. A. L. Elmslie (Cambridge, 1911); Emil Schuerer, *Verzeichnis der Personennamen in der Mischna* (Leipzig, 1913).

MISILMERI, *mě'zěl-mā'rě*. A town in the Province of Palermo, Sicily, 10 miles south of Palermo. The castle, situated on a hill overlooking the town, commands a magnificent view of the surrounding country. The inhabitants are chiefly engaged in agriculture, the produc-

tion of oil and wine. Pop. (commune), 1901, 12,819; 1911, 11,876.

MISIONES, me'se-ō'nás. A territory of Argentina, situated at the northeast end of the Republic, between Paraguay and Brazil, and bounded on the southwest by the Department of Corrientes (Map: Argentina, H 3). Its area is estimated at 11,285 square miles. It has a subtropical climate and is watered by numerous small affluents of the Paraná and the Uruguay. The soil is very fertile and the varied flora comprises more than 1500 species. Most of the territory is very densely wooded, only a small portion of its area being under cultivation. The chief products and articles of export are cabinet woods, sugar, *yerba maté*, or Paraguay tea, tobacco, corn, rice, cotton, fruits, and hides. In the seventeenth century the Jesuits planted in and around the present territory over 30 missions. With the expulsion of the Jesuits their missions fell into decay. The population of the territory in 1900 was 32,521; in 1912 (est.), 45,174. The capital of the territory is the thriving town of Posadas on the Paraná, with a population of about 15,000.

MISKO'A. A remarkable order of the Chætopoda, discovered by Walcott in the Middle Cambrian rocks of British Columbia, where the fossils are preserved with all details of structure. They are Polychæta, having similar segments and parapodia throughout the length of the body, with a retractile proboscis and straight enteric canal. Their primitive structure is shown in that their body is not distinctly specialized into sections. Striking types of the order include Miskoia and Wiwaxia (qq.v.). They are named after Misko Pass in British Columbia.

MISKOLCZ, mish'kólts. The capital of the County of Borsod, Hungary, situated in the valley of the Szinva, 88 miles northeast of Budapest (Map: Hungary, G 2). It has several interesting ecclesiastical buildings, among them the thirteenth-century Reformed church of St. Stephen, a Minorite convent, a merchants' hall, a Protestant Gymnasium and two lower Gymnasias, a fine hospital, and a Hungarian theatre. It is lighted by electricity and has a fine municipal bath. The trade in wine, agricultural products, and cattle is considerable. The local manufactures consist of flour, shoes, pottery, porcelain and majolica wares, and machinery. There are large wine cellars in the neighborhood. Pop., 1900, 43,096; 1910, 51,459, chiefly Protestant Magyars.

MISNOMER (OF. *mesnomer*, *mesnommer*, dialectic Fr. *ménomer*, misname, from *mes-*, from Lat. *minus*, less + *nommer*, name, from Lat. *nominare*, to name, from *nomen*, name). An error in naming a person in a pleading, deed, or other written instrument. Under the common-law rules of pleading a party intended as the defendant in an action can take advantage of a mistake in designating him by an incorrect name by a plea in abatement which simply alleges the error and states his true name. However, in England and the common-law jurisdictions in the United States this defect may now be cured by amendment if the person so served appears in the action, even though he pleads the misnomer. Where a person is served with a process intended for him but not designating him by his correct name, he may disregard it, and a valid judgment cannot be entered against him. Under modern codes of procedure the same rules

apply, except that if a person is served with a summons incorrectly naming him, and he desires to appear and object, he must make a motion to set aside the service on the ground of mistake. In such a case the plaintiff will be allowed to amend his summons and complaint, usually upon terms, such as the payment of costs. The term "misnomer" is less frequently but correctly applied to a mistake in a name in written instruments other than pleadings. See INTERPRETATION; EQUITY; MISTAKE; NAME; PLEADING; WILL; ETC.

MISPICK'EL (Ger.). See ARSENOPIRYTE.

MISPRISION, mis-priz'hūn (OF. *mesprision*, *misprison*, mistake, from *mesprendre*, to mistake, from *mes-*, from Lat. *minus*, less + *prendre*, from Lat. *prehendere*, *prehendere*, to take). In its general sense, a crime under the degree of a capital offense but graver than an ordinary misdemeanor (q.v.). In the early English law it was more frequently employed in a negative or passive sense, to describe the omission to perform some important legal duty, as concealment of the felonious acts of another. It is also applied to certain positive acts in the nature of contempts against the dignity and peace of the King and his officers. Misprision of treason was the most serious offense to which the term applied, and consisted in the concealment of any knowledge which a person might have of treasonable acts or utterances against the King, and did not necessarily imply that the person was himself otherwise implicated or involved in the crime. It was formerly punishable with forfeiture of goods and imprisonment for life, but by statute forfeiture of goods has been abolished, and penal servitude for life remains the maximum statutory penalty. Misprision of felony is concealment of a felony by one who did not participate in its commission by act or encouragement, but who has learned of it in some way. It is still an offense in the English law, but is rarely prosecuted. The various acts and omissions, other than the above, which were formerly included in the rather vague term "misprision," have been mostly classified with the crimes with which they were associated, under the name of accessory acts.

The term "misprision" is seldom employed in the United States except in regard to treason, and by an act of Congress misprision of treason is punishable by a fine not exceeding \$1000 and imprisonment not exceeding seven years. See ACCESSORY; CRIME.

MISREPRESENTATION. An untrue representation, by words or by conduct, which induces another to act to his injury. When deliberately or recklessly made by one party to a business transaction concerning a matter of fact and relied on by the other party to his damage, it amounts to fraud (q.v.), or deceit (q.v.). A false representation, if made by an honest mistake, never subjects the maker to an action in tort. Whether it will afford the party to whom it is made a ground for relief of any kind depends upon the circumstances of the case. As a rule, an innocent misrepresentation will not affect the validity of a contract in connection with which it is made, unless it was the very basis of the contract or one of its material terms.

In certain classes of contracts, notably those of marine and fire insurance (q.v.), any misrepresentation or concealment of a material fact, however innocent, renders them void. This is

due largely to the fact that such contracts have come into English law from the law merchant, and that early mercantile usage put an absolute legal duty on the insurer to state correctly all facts relating to the thing insured, which would ordinarily affect the insurer's decision in taking the risk. Courts of equity deal somewhat differently with innocent misrepresentation from courts of common law. They will generally refuse a decree for specific performance in favor of one whose claim rests upon a misrepresentation, although it is an honest one; and in some cases they grant a rescission of a contract induced by such statements when in a court of law the contract would be enforceable. Consult: Anson, *Principles of the Law of Contract* (Oxford, 1900); Burdick, *The Essentials of Business Law* (New York, 1902); Kerr, *A Treatise on the Law of Fraud and Mistake* (London, 1902).

MISRULE, LORD OF. A mock dignity which presided over the Christmas revels of the Middle Ages. He was assisted by a staff of from 20 to 60 officials, and furnished with musicians, dragons, hobbyhorses, and other paraphernalia of fun. In Scotland the Lord of Misrule was sometimes known as the Abbot of Unreason, and in France as l'Abbé de Liesse. See **ABBOT OF JOY**.

MIS'SAL (ML. *missale*, from *missalis*, relating to the mass, from *missa*, mass). The book which contains the prayers, lessons, and rubrics of the mass in the Roman Catholic church. Until the Middle Ages the various parts of the service were distributed in separate books, according to the part taken by the assistants; the parts which the celebrant alone recited in the mass and other sacraments were contained in the *Liber Sacramentorum*, or sacramentary. But when low masses became more frequent, and the celebrant had to say practically the whole service, the parts were collected into one book called *Missale Plenarium*. These complete missals have been in use since the sixth century. By the twelfth the Roman liturgy was in use generally throughout western Europe, but a number of provinces and dioceses had their own missals. The disadvantages of this diversity in liturgical use caused numerous requests to be made to the Council of Trent for a reform in the matter. The Council appointed a commission on the subject in 1562, and as they had not concluded their labors by the last session, left the decision in the hands of the Pope. The commissioners, among whom was Thomas Goldwell, Bishop of St. Asaph in Wales, were not instructed to compile a new missal, but by examination of ancient manuscripts to reconstruct the Roman missal according to the rites and customs of the fathers. Pius V authorized the missal which was the result of their work by the bull *Quo Primum* of 1570, commanding its universal use in places which could not show a prescription of 200 years for their local uses. Thus the older orders, such as the Carthusians and Dominicans, preserved their traditional rites; and the Ambrosian missal held its ground in the diocese of Milan. Further revisions took place under Clement VIII in 1604 and Urban VIII in 1634; later revisions, as by Leo XIII in 1884 and 1898, have touched merely matters of detail, principally in the rubrics. Besides these and the tables which are in the beginning of the book, it includes the proper of the seasons, i.e., the service for the Sundays and greater festivals; the proper of saints, arranged in the

order of the civil calendar from St. Andrew's Day, which regulates the beginning of Advent and thus of the ecclesiastical year; and the common of saints, the services for those days which have no special mass. The central and invariable parts, known as the *Ordo* and *Canon Missæ*, come before the service for Easter Day. The older local missals, especially the French and English, are of great interest to liturgical students. No new attempts have been made to construct such books in the Catholic church except by some French bishops under Jansenist influence about the end of the seventeenth century; these held their own in certain places even as late as the middle of the nineteenth century, when they were all laid aside, largely through the influence of the celebrated scholar Dom Guéranger. Consult William Maskell, *The Ancient Liturgy of the Church of England, according to the Use of Sarum, York, Hereford, and Bangor* (3d ed., Oxford, 1882). See also **LITURGY**, and references given there; **MASS**.

MISSEL THRUSH. See **MISTLE THRUSH**.

MIS'SI (Lat., those sent). Officials sent out by the Frankish kings for special purposes. Under Charles the Great the *missi dominici* were the Emperor's special representatives. The Empire was divided into a number of districts; into each district each year two *missi*, one a lay noble, the other an officer of the Church, were sent to hold court, hear complaints, redress grievances, and make a special report to the Emperor. By this means Charles sought to control the courts and to centralize the government. The *enquêteurs*, employed by St. Louis, had similar functions. Consult Dobbert, *Ueber das Wesen und den Geschäftskreis der Missi Dominici* (Heidelberg, 1861), and J. W. Thompson, *Decline of the Missi Dominici in Frankish Gaul* (Chicago, 1903).

MISSING LINK. A term used to designate the stage assumed to intervene in evolution between the ape and man, and in a more general sense any hypothetical form intermediate between two actual forms of life.

MISSION (Lat. *missio*, a sending, from *mittere*, to send). In the singular, a term used by Roman Catholics and Anglicans to designate a series of special services lasting usually for at least a week, intended to call sinners to repentance and to deepen the spiritual life of the faithful; somewhat analogous to the revival services in some other churches. In the Roman Catholic church such work was constantly carried on by some of the most famous saints, such as Francis of Assisi, Dominic, Carlo Borromeo, Francis de Sales, Vincent de Paul, and Alfonso Liguori. The last two especially founded their congregations (see **LAZARISTS**; **REDEMPTORISTS**) for such a purpose. In modern times the means employed and the order of exercises have become more systematic. Fervent preaching by the missionaries, who are usually members of some religious order, is the salient feature; it deals largely with sin, repentance, death, judgment, heaven and hell, and its purpose is to bring the hearers to a devout reception of the sacraments and an earnest Christian life. It usually closes with a solemn service of renewal of baptismal vows, thanksgiving, and consecration, and with the proclamation of a special indulgence. In the last third of the nineteenth century similar missions were held with increasing frequency in the Anglican communion, especially in High Church parishes.

MISSION, CONGREGATION OF THE. See LAZARISTS.

MISSIONARY RIDGE, BATTLE OF. See CHATTANOOGA, BATTLE OF.

MISSION INDIANS. A collective term for the surviving remnants of the tribes civilized and Christianized by the efforts of the Spanish Franciscan missionaries in southern California in the latter part of the eighteenth century. They were originally of many various dialects and stocks, chiefly Shoshonean and Yuman, roving over the desert and mountain region stretching from the lower Colorado River to the Pacific, and in almost the lowest stage of culture. By the heroic and persistent labor of Father Junípero Serra and his successors, beginning in 1776, they were gathered into civilized communities, where they supported themselves by farming and simple mechanical arts and, under the kindly supervision of the fathers, reared those magnificent mission structures which are the glory of old California. For half a century the missions grew and flourished, until in 1831 they contained 19,000 civilized Indians, but with the overthrow of the Spanish power by the Mexican revolutionary government came oppression, spoliation, and finally confiscation and destruction in the period from 1835 to 1840. The missionaries were banished, the missions plundered and left to fall into ruin, and the Indians driven into the desert and the mountains. Under the later American rule the remnants of the mission Indians continued to be regarded and treated as outcasts until, chiefly by the endeavor of Helen Hunt Jackson (q.v.), public attention was so forcibly directed to their neglected and unfortunate condition that the government took steps for their relief by setting aside some small reservations for their occupancy and appointing an agent to look after their affairs, together with a good school equipment. Since then some progress has been made towards bringing them up to the standard to which they had attained under the mission system more than a century ago. The two great barriers in the way are the uncertain tenure of their lands and the monopoly of the water supply by white claimants. At present they occupy a number of small reservations in southern California. The total population is about 2000. They are best known as the makers of fine baskets. Consult: Jackson and Kinney, *Report on the Condition and Needs of the Mission Indians of California* (Washington, 1883); C. A. Wetmore, *Report on Mission Indians of Southern California* (ib., 1895); Zephyrin Engelhardt, *Missions and Missionaries of California*, vol. i (San Francisco, 1908); "A Mission Record of California Indians," in *University of California, Publications: American Archaeology and Ethnology*, vol. viii (Berkeley, 1908).

MISSIONS, CHRISTIAN. The term "missions" as used in this article signifies Christian missions among the peoples of non-Christian countries. The history of missions may be divided into three periods: 1. The early period, embracing the first seven centuries of our era, until the rise of Islam. In this period missionary activity was generally unorganized and individual. 2. The middle period, including nine centuries, from the beginning of the eighth to the end of the sixteenth century. Here the Church as an organization originated and directed foreign-missionary activity. 3. The modern period, from the beginning of the seventeenth

century until the present time. In this period occurred the rise of Protestant foreign missions, chiefly conducted by voluntary societies.

I. THE EARLY PERIOD

The energy of the Apostles in winning men to believe in Jesus Christ is a characteristic feature of the New Testament narrative of the beginnings of Christian history. Early traditions give ground for belief that their missionary operations were extended. Yet excepting in the case of Paul and his companions details are meagre. The explanation of the rapid spread of Christianity seems to be that individual believers taught it wherever they went, whether for business, for safety from enemies, or as slaves to heathen masters. Great importance was attached also to translating the Bible into the language of every people at this period. Examples of this automatic spread of Christianity may be seen in its appearance in Antioch before any Apostle went there, its entrance into Italy before Paul's visits, into Britain by way of Gaul from Smyrna during the second century, along the ordinary routes of trade, and into the bivouacs of the Goths in the third century through captives taken in war. By the time of Constantine the Great, early in the fourth century, groups of Christians were found in all parts of the Roman Empire, from Britain to Persia. Christians formed but a small percentage of the population. But they had a high ideal and the energy of aspiration. This produced unflagging activity in missions in the West and in the East. The monasteries now performed great services for religious culture in out-of-the-way places. In the fifth century the centre of missionary initiative for the West seems to have been in central Gaul. Thence bishops went over into Britain to help the Christians settle doctrinal difficulties, and thence Patrick took his new-found knowledge into Ireland. For the East at the same time the centre of missions seems to have been in Mesopotamia, at places like Edessa and Nisibis, with a long chain of advance posts reaching into central Asia and India, and with a training school at Samarkand. Towards the north at the same period Ulfilas (q.v.) went on a mission to his heathen kin in the region of the Danube, giving them an alphabet and a Bible in their own tongue. In the sixth century the initiative in the West was from the British Islands eastward and from France northward. Desire to teach Christ brought Columba from Ireland to Iona, which became a wonderful centre of Christian culture and of missionary zeal in behalf of Scotland, North Britain, and central Europe. As to the East, the line of foreign missionary advance was among the Tatars and in China, and was carried on by Nestorians in relations with the Church in Mesopotamia. At the very end of the sixth century the beginning of a missionary policy in the Church as an organization appeared in the dispatch of Augustine (q.v.) and his helpers from Rome to England, where the Saxon invasion had nearly crushed out Christianity. Augustine's mission from the Pope was to evangelize the pagans and to win the assent of the English Christians to Roman ecclesiastical control. The method of operation of these independent missions was an adaptation of the monastic system. A band of Christians under a leader would form a settlement in a wild and savage

region, where they labored for their own support. By kindness some of the barbarians would be drawn to settle near the monastery. After the favor of emperors began to give the Church numerical preponderance, power, and wealth, these gains led to spiritual loss, and missions were left to the chance ability of simple-minded believers in remote regions. At the beginning of the seventh century Christianity was still an Oriental religion. In Europe its northern bounds were, in general, marked by the Danube and the Alps, although during the century missionaries made ineffectual attempts at a lodgment in Denmark, and Columban, going forth from Iona with his associates, began a fiery and successful propaganda among the barbarians of central Europe. The narrow limits of European Christendom at this time should be borne in mind if we would realize the full meaning to the Christian Church of the Mohammedan irruption. The Eastern church had one momentous mission to its credit in the ninth century in its dispatch of Cyril and Methodius to work among the Slav races. In the Far East the Nestorians also continued their operations until the Tatars finally cast in their lot with Islam, and Tamerlane in the fourteenth century destroyed the last vestiges of the Central Asian church. But with regard to the Church in general, from the end of the seventh century onward for 900 years the only Christian foreign missions were remote from the touch of the Mohammedan power and belonged to the Western or Latin section of the church.

II. THE MIDDLE PERIOD

1. In Germany. The wanderings of the Germanic nations and the inroads of the Huns had destroyed along the Rhine and the Danube the flourishing Christian communities of the fifth century. It was only after the rise of the Frankish state that efforts were made to restore the former condition of Christianity and to spread its influence over all central and northern Europe. From the conversion of the Bavarians to that of the Saxons (500-800) stretches a period filled with spiritual heroism on the one side and with tenacious resistance on the other. The missionaries are mostly Irishmen in the first half of the period, Anglo-Saxons in the other. The memory of the famous St. Severin (died 482) worked favorably in Bavaria; early in the sixth century the royal family of the Agilulfrings was Catholic. Irish missionaries worked in the land throughout the seventh and eighth centuries. The Frankfort saints Rutupert, Emmeran, and Corbinian continued and perfected their labors. The Irishman St. Gall (Callech) was the apostle of Swabia and Helvetia; from his monastery by Lake Constance went out the missionaries of these lands. At the same time his superior and long-time companion, Columban (died 615), converted the German Lombards of Italy to the Catholic faith, Southern Germany owes the knowledge of the Christian faith to other Irish missionaries—St. Fridolin, once abbot at Poitiers and then founder of the island abbey of Säkingen; St. Trindpert, founder of the abbey of that name in the Breisgau; St. Pirmin (died 753), founder of Reichenau, Murbach, and Hornbach. The Irishman St. Kilian (died 689), with his companions Coloman and Totnan, evangelized Thuringia, and founded the see of Würzburg. Contemporaneously St. Willibrord came from the

monastic schools of Ireland to preach the faith to the fierce Frisians and to found the archbishopric of Utrecht, with the authorization of Pope Sergius I (695). Before Willibrord there had worked along the Rhine and the Moselle the holy man Goar in the sixth century, and among the Frisians St. Amand of Maestricht (660) and the goldsmith St. Eloi (Eligius) of Noyon (659). All of these men came under the influence of the Columban monastery of Luxeuil and were filled with missionary zeal.

The real apostle and founder of German Christendom is the Anglo-Saxon Wynfrith, or Boniface (q.v.). In 716 he attempted to evangelize the Frisians. In 719 he received at Rome from Gregory II (715-731) the authority to preach among the degenerate Christians and the pagan inhabitants of Germany. In turn he labored throughout Bavaria, Hesse, and Thuringia, and along the Rhine, founded the oldest and principal sees of those regions, established monasteries like Fulda, and gathered about himself some of the noblest spirits of the age. The Carolingians were always friendly and helpful. In union with them he held, between 740 and 750, four national synods that laid the basis of German mediæval Christian life. He suffered martyrdom June 5, 755 (?754), at the hands of heathen Germans, near Dockum in West Friesland, whither he had gone with 52 companions to confirm some newly baptized converts. The solid mass of Saxon paganism had been attacked by the two Ewalds, surnamed the Black and the White, like Willibrord, disciples of the Irish monastic schools. They sealed their hopes with their blood in 695. The long wars of the Carolingians with the Saxons soon took on a religious character. Compulsory baptism and swift apostasy were the rule throughout the eighth century. A cruel slaughter of 4500 Saxons at Verden in 782 stains the fair fame of Charlemagne. The conquered Saxons were exiled, transplanted, oppressed by laws of Draconian severity; in 785 the dauntless chiefs, Witikind and Alboin, finally yielded, and by 804 the land was entirely Christianized. Missionaries soon overran Saxony, and by their virtue, beneficence, organizing skill, and their monasteries, soon established the Christian faith on a firm basis. The abbey of Corvei (822) was soon the centre of their activity.

2. Among the Northern Nations. Another period of 300 years (800-1100) was necessary for the winning of the northernmost Germanic tribes. In 826 political necessity made Harald, King of Denmark, a suitor at the court of the Carolingians. On his return he took with him Ansgar, a monk of Corvei, eventually the apostle of the North. His chief deeds were the establishment of the see of Hamburg-Bremen (832), the partial evangelization of Sweden (850), the building of churches, schools, monasteries, and hospitals throughout his own vast diocese. He died in 865 and is buried at Bremen. The devastations of the pagan Northmen and the onslaught of the Hungarians withheld from the northern missions the political influence of Christian Germany; after the battle of Merseburg (933) the conversion of Denmark went on, not without interruption, from the see of St. Ansgar. The Danish conquests in England helped this process; in 1017 both kingdoms were ruled by Canute the Great; in 1026 he was a pilgrim to Rome, whence he wrote to his people a noble Christian letter. In 1086

another Canute was enrolled among the Christian saints. In 1104 Lund was made a metropolitan see. Sweden was slowly won over to the faith of Jesus Christ, chiefly in the course of the eleventh century, and with many a reaction to pagan life and belief. In 1162 Upsala became the Christian metropolis of Sweden. Long ere this Norway possessed a metropolitan see at Trondhjem (1035). The land was thoroughly Christian before Denmark and Sweden, although it received the visits of missionaries after both of these kingdoms. Haakon the Good (c.934-960) was an earnest Christian King, but another did not arise until Olaf Tryggvason (995-1000). Olaf Haraldson (1016-28) sent German and English priests through the Kingdom; his over stern and cruel policy created a reaction, but the still harder yoke of Denmark favored the cause of Christianity. From 1035 Norway may be styled a Christian kingdom. Iceland was temporarily inhabited by Irish monks before the year 800; their books, altar plates, and staves were found by the first Norwegian settlers. After 981 Christianity penetrated the masses of the colonists and by 1016 they had accepted the Gospel. Under its impulse this gifted little people became a living source of learning and piety. The scattered islands of the northern seas were held during the ninth century in the grip of the pagan vikings, but in the course of the tenth century were made Christian. Before the epoch of the Danish invasions of Ireland monks of the Irish nation had visited these islands, chiefly out of ascetic fervor and the desire to lead hermit lives. They were the first to bring Christianity to the dwellers of the Orkneys, the Hebrides, and the Shetland and Faroe islands. In the twelfth century Greenland was evangelized and the see of Gardor established on the coast; the land was inhabited by Christians until the fifteenth century.

3. Conversion of Eastern Europe. Slavs and Magyars. As the Slavs had been, since the sixth century, a serious menace to both the East and the West, so the efforts to Christianize them went out from East and West. The Irishman St. Columban, of Luxeuil and Bobbio, had once hoped to begin the work; it was certainly set on foot from the German see of Salzburg in Bavaria, and a beginning made (797) with the Avars, who at this time disappear from history. In the course of the ninth century the principal Slavic principality was that centred along the river Morava, hence called Moravia. Both Germans and Byzantines sought to reserve this sphere of influence and action for themselves. In 862 the Byzantine Emperor, Michael III, was able to send two missionaries to the Moravians. They were brothers, known to history as St. Cyril (originally Constantine) and St. Methodius. They introduced among the Slavs an alphabet, translated the Scriptures, and wrote for them a Slavic liturgy. To these two men the Slavic world owes its first permanent elevation from idolatry, ignorance, and serious moral corruption. Moravia's chief see, Olmütz, dates from 1063.

Bohemia was fully opened to Christian influences only about 871, when its King, Borzivoi, gave his daughter in marriage to Svatopluk of Moravia and, together with his Queen, Ludmilla, was baptized. Of his grandsons, Boleslas cruelly persecuted the Christian faith; while Wenceslas remained faithful; the latter fell by

the hand of his brother (938), and is honored as a martyr. In the long reign of the second Boleslas (967-999) Christianity triumphed. The see of Prague was created in 973. The second Bishop, St. Adalbert, went to preach the gospel among the heathen Prussians, and was put to death by them.

Poland received the missionaries of Christianity through the marriage (965) of its Duke Miecislav with the Christian daughter of Boleslas II of Bohemia, who soon won over her husband to the faith. The see of Posen was established in 968. From 992 to 1025 Boleslas Chrobry, son of Miecislav, completed the conversion of his country by the founding of the archiepiscopal see of Gnesen (1000), to which were made subject Posen, Kolberg, Breslau, and Cracow.

The Wends were a Slavic race, established in Holstein, Mecklenburg, between the Elbe and the Oder, the Oder and the Vistula, and elsewhere in Saxony and Lusatia. They were made Christians by the creation of the border marches in the time of Henry I and Otho I (919-973) and the foundation of the sees of Havelberg, Oldenburg, Brandenburg, Magdeburg, and others (946-968). The Wend Prince, Gottschalk, was after 1045 a zealous protector of Christianity, but was treacherously slain in 1066 by a heathen Wend. In the twelfth century the Wends fell under German sway and many German Christian colonists took their lands and houses. The Wends of Pomerania owe their conversion to the Polish Duke Boleslas III (1122) and to his agent, Bishop Otho of Bamberg (1124-28). Kamin, Stettin, Julin, were made Christian cities and Saxon colonists entered the territory; but only in 1168 were the last remnants of heathenism abolished on the island of Rügen.

The Scandinavian Rurik founded the Russian state in 862; soon Christian missionaries from Constantinople found their way thither. The widowed Princess Olga was baptized at Constantinople in 955 and thenceforward labored zealously for the conversion of her people. Her grandson, Vladimir the Apostolic (died 1015), completed the work. The metropolitan see of Kiev was established by him and made the centre of the religious and educational life of Russia. The primacy was transferred to Moscow in 1328, which in turn was subject to the jurisdiction of Constantinople until 1589, when Jeremias II, the patriarch of the latter see, was induced to install the patriarchate of Moscow.

Bulgaria became Christian, 864-866. The Khan, Bogoris, first introduced Greek missionaries and then appealed to Pope Nicholas I. The latter sent him the famous "Replies to the Consultations of the Bulgarians." Nevertheless, Bulgaria soon came under the sole jurisdiction of Constantinople; the land was subjected by the Byzantine emperors, and in 1388-93 the new Bulgarian realm was conquered by the Turks.

The heathen Magyars had taken possession after the end of the ninth century of what is now Hungary. All attempts at their conversion were fruitless until the victory of Otho the Great of Germany on the Lech in 955. Duke Gejza (972-997), married to a Christian Princess of his own race, asked Otho II for missionaries; the bishops Pilgrim of Passau and Wolfgang of Regensburg were sent to him. Gejza's

son, St. Stephen of Hungary (997-1038), was married to Gisela, the daughter of Henry II. He created the hierarchical system of Hungary by founding (1000) the archiepiscopal see of Gran with 10 suffragan sees, as well as many Benedictine monasteries. Pope Sylvester II (Gerbert) gave him the title of "Apostolic" King, and is said to have sent him a golden cross and crown (crown of St. Stephen).

4. **Missions in Northeastern Europe. Political Conversions.** The power of Christendom was now too great to be longer resisted by the outlying heathen peoples. From Sweden went out at the same time the political subjection of Finland and its conversion to Christianity. It was only in 1293 that the work could be looked on as accomplished. Esthonia, Livonia, and Courland saw Christian missionaries during the twelfth and thirteenth centuries follow in the tracks of the German merchants of Bremen and Lübeck. Here the heathen were fierce and reluctant; fortified monasteries protected the German Christians and the newly converted, until, in 1202, was founded the military order of the Brothers of the Sword (*Schwertbrüder*) or Knights Sword Bearers. Its founder, Bishop Albert of Buxhöwden, built the city of Riga and set up therein his see. In 1237 the Brothers of the Sword were united with the Teutonic Knights of Jerusalem, and for 60 years both orders carried on an unceasing warfare against the pagan inhabitants of the Baltic shore. Their most difficult conquest was that of the Prussians. This most stubborn of the northern heathen folk gave way only before the organized and experienced knights of German Christendom and the moral and financial support of the Empire. In 1243 the Prussian territory was divided into four sees—Kulm, Pomerania, Ermland, Samland; in 1255 they were placed under the jurisdiction of the archiepiscopal see of Riga. The Lithuanians, temporarily converted in 1252, relapsed into heathenism. Their Grand Prince, Jagello, married in 1386 the Polish Queen Hedwig, by which act Poland and Lithuania were shortly made one politically. Jagello was baptized, assuming the title of Ladislas II. Vilna was made an episcopal see, and at a diet held there Christianity was declared the state religion.

5. Missions in the Sixteenth Century.

(a) *In the Orient.*—The Portuguese sailors and the merchants were always accompanied by missionaries. As early as 1533 Goa was made an episcopal see. The unworthy conduct of the Europeans was no small obstacle for the missionaries when confronted with such religious systems as those of the Brahmans, Buddhists, and Mohammedans. At the request of the King of Portugal St. Ignatius of Loyola destined for the East Indies in 1540 Rodriguez and St. Francis Xavier. The latter actually sailed in 1541 from Lisbon, and after some time spent in evangelizing the Europeans of Goa, turned his attention to the people of southern India. He preached in the Kingdom of Travancore, and went thence to Malacca and the Moluccas, meeting everywhere with great success. Soon his zeal urged him to undertake the conversion of Japan, where he spent two years (1549-51). In the hope of hastening the conversion of Japan, he turned his attention next to China, but died on the way on the island of Sancian, in November or December, 1552. His labors in the East Indies were continued by his Jesuit brethren,

especially by Robert Nobili, after 1606. The latter made himself one with the Indian aristocracy, accepted its prejudices, habits, and customs, so far as seemed consistent with Christianity, and enjoyed a large measure of success.

The Nestorian missions in China during the seventh and eighth centuries and the Franciscan missions of the thirteenth and fourteenth had no lasting results. In 1583 the Jesuits obtained entrance, and for over a century exercised a moral supremacy in the Flowery Kingdom. Matteo Ricci (1552-1610) rose to the highest official position. His teaching, surveys, and maps were the admiration of all China.

Adam Schall of Cologne (1622) and Ferdinand Verbiest of the Low Countries (1659) won great fame for their order as successors of Ricci. Under cover of their reputation for scholarship they labored zealously for the spread of Christianity, quite in the spirit and manner of Robert Nobili. The opposition to this system of "accommodation" grew so strong that it was condemned in 1704, and the condemnation was confirmed 40 years later (1744) by the holy see. The Christian communities of Japan were grievously persecuted in 1587 and again from 1596 to 1637, when the Empire was strictly closed against all foreigners, with the exception of Dutch traders.

(b) *In America.*—The original Spanish conquistadores were very inhuman towards all nations with whom they came in contact. The first Catholic priest ordained in the New World was a young Spanish lawyer, Bartolomeo de las Casas. He soon gave himself entirely to the work of saving the Indians from their barbarous oppressors; and before his death, in 1566, he had compelled the legislation which saved the remnants of the aboriginal tribes, at least on the mainland. Similarly, St. Peter Claver (died 1654) was tireless in the service of the unfortunate negro slaves of South America. Throughout the sixteenth century Dominicans, Franciscans, Capuchins, and Augustinians labored with boundless zeal in all the Spanish colonies. The Jesuits were already in Brazil (1549), and soon had their missionaries in all parts of South America. The famous "Reductions of Paraguay" are perhaps their greatest triumph. One of the most picturesque figures of that period is the Limerick Irishman, Thomas Filde, a Jesuit, who died at Asunción in 1626, after spending 40 years among the savages of Paraguay. In North America the French missionaries followed the flag of France and worked unremittingly after 1611 throughout all the dominions over which it floated. In 1634 Jesuit missionaries accompanied the first colonists of Maryland.

III. THE MODERN PERIOD

A. **Protestant Foreign Missions.** 1. *State Missionary Enterprises.*—At the time of the Reformation Christendom was still beleaguered by armed Islam. Up to the very end of the seventeenth century a great part of Hungary was in the possession of Turkey, and in 1683 Vienna barely escaped falling into the hands of the Mussulmans. Missionary access to eastern north Africa and western Asia was barred by the sword of Islam. At the same time transmarine heathen lands were so distant that Imperial resources alone could reach them. Such resources were all in the hands of the great Roman Catholic powers. The conditions under

which the Reformation developed left to the reformers no place for planning foreign-missionary enterprise. Luther and his associates appreciated the essentially missionary quality of the Church of Christ, but limited its sphere of action to their own surroundings. They deemed that in any case the Church was helpless regarding foreign missions, since such vast undertakings could be dealt with by governments alone.

The first Protestant foreign missions, then, were state enterprises. In 1555 Admiral Coligny induced the Council of Geneva to send missionaries to Brazil in connection with a Huguenot colony, but both mission and colony soon ended in bloody disaster. In 1559 Gustavus Vasa of Sweden sent missionaries to labor for the pagan Lapps of his own dominions, but this mission came to naught. After the conquest by Holland of several Portuguese colonies in the East Indies the Dutch East India Company was formed in 1602, and the governors of the various islands were ordered to do all in their power to Christianize the natives. Clergymen were sent out to Ceylon, Formosa, and the Malay Archipelago as missionary chaplains, whose duty included the Christian instruction of natives. But the governors of the colonies obeyed their orders literally and "Christianized" the natives without waiting for the missionaries to instruct them. Consequently, when Dutch government came to an end in Ceylon, some 300,000 officially converted natives returned to their former faith. In Formosa Christianity was extinguished by the Chinese when they drove the Dutch from the island in 1661. In Java, however, the missionary chaplains slowly translated the Scriptures into Malayan. The second of modern Bible translations into pagan languages (John Eliot's Indian Bible, printed in 1683, being the first) was thus produced by the initiative and published (in 1701) at the expense of the Dutch government. With all its defects this state mission enterprise had permanent results. In Java, the Moluccas, and Celebes has grown up a native Christian church, numbering nearly 250,000 adherents, with over 350 pastors and preachers, supported by the Dutch government. Of these probably not more than half are the fruit of later missionary efforts. A similar mission undertaken by Holland in Brazil, through the West India Company, about the year 1621, came to an end with the expulsion of the Dutch about the middle of the century. Such missionary enterprises undertaken for reasons of state, manned by official appointment, and supervised by colonial bureaus and chambers of commerce, were foredoomed to failure. The next of the state missionary enterprises originating on the continent of Europe illustrates this fact. In 1705 a woman whose husband had been killed by natives in the Danish colony of Tranquebar, in South India, petitioned King Frederick IV of Denmark to send missionaries to teach the people there. The petition was effective. The King endowed the mission, and, no fit men being found in Denmark, two Germans were appointed to go to India. They were of the disciples of Francke, the German pietist, who saw that the highest form of Christian fruitfulness includes foreign as well as home missions, and whose energy formed schools at Halle to prepare men to serve Christ in the ends of the earth. The two young men, Ziegenbalg and Plutschau, taught singleness of purpose at Halle, and sent

out by King Frederick IV in 1706, began the first serious Protestant mission enterprise in India. Before his death, in 1719, Ziegenbalg had made a translation of the New Testament into the Tamil language, which became the basis of the existing Tamil Bible, and the third modern translation of the Scriptures into heathen languages. Other missionaries from the same home surroundings followed the two pioneers of this Danish mission, notably Schultze and his later associate, Schwartz. Each of these men made a permanent impression upon the people of the country. Fifty thousand Tamils became Christians before the end of the century. After the death of King Frederick IV the English Society for the Promotion of Christian Knowledge assumed the whole support of the Danish mission in India until 1824, when the enterprise was passed over to the Society for the Propagation of the Gospel. Another mission maintained by King Frederick IV was that commenced by Hans Egede in Greenland in 1721. It was later transferred to the Danish Missionary Society, and the whole Eskimo population in the neighborhood of the numerous Danish trading stations was long ago Christianized.

The British government took steps early in the seventeenth century for the Christianizing of its colonies. The Virginia Company, whose enterprise began in 1584, was directed by its charter to teach Christianity to the Indians, and Sir Walter Raleigh subscribed £100 to that object. The same duty was laid upon the Massachusetts Colony by charter in 1628. In 1646 the Legislature of Massachusetts passed a law for missionary work among the Indians. This gave State support to the efforts of John Eliot of Roxbury, Thomas Mayhew of Marthas Vineyard, and others. In 1648 Cromwell induced the English Parliament to consider the organization of a government foreign-missionary enterprise. The renewal of civil war, however, put an end to the scheme. But the Corporation for the Propagation of the Gospel in New England, formed in England in 1649, received a grant from Parliament and aided Eliot's mission. It still exists under the name of the New England Company, and expends the revenue from its endowment funds for the education of Indians in the Dominion of Canada. All these efforts resulted in the formation of several villages of converted Indians in New England before progress was arrested by war. In the East Indies, on the renewal of the charter of the British East India Company in 1698, the duty was imposed upon the company of maintaining chaplains at its stations, and later the obligation to see that its native servants were instructed in Christian doctrine. Discussions regarding religious conditions in the company's stations led to the organization in 1698 of the Society for the Promotion of Christian Knowledge (S. P. C. K.), designed to provide Christian schools and books for neglected English communities. This was followed three years later by the organization of the Society for the Propagation of the Gospel in Foreign Parts (S. P. G.), designed to provide chaplains for the religious culture of Englishmen in foreign lands. Neither of these societies aimed at Christianizing the heathen. But the S. P. C. K. saved the Danish mission in South India from dying with its founder, and supported it for 100 years. It has also issued

Christian literature in the languages of various non-Christian peoples. As to the S. P. G., it gradually took up work among the pagans, and in 1913 it had 1291 missionaries and 3000 native workers in India, China, Japan, Malaysia, Africa, and the West Indies. In view of their later history, these two societies may be regarded as the earliest of the voluntary foreign-missionary societies of Great Britain.

2. Protestant Voluntary Missionary Societies.—In 1709 the state of the North American Indians led to the formation, in Scotland, of a Society for the Promotion of Christian Knowledge. The chief present importance of this society was its employment as a missionary (in 1744) of David Brainerd of Connecticut. The story of his brief life had persuasive influence on both sides of the Atlantic in stimulating similar devotion. A more powerful influence of the same nature was exercised by the writings and the example of the Moravian Brethren, who called themselves the Unity of Brethren. A remnant from persecution, this little people migrated from Bohemia and in 1772 found asylum in Germany. They were allowed to settle on the estates of Count Zinzendorf, who was himself a pupil of Francke of Halle and who became their leader. The Brethren established missions among the slaves of the West Indies, in Greenland, among the Indians of the North American Colonies, in South Africa, in South America, and in Labrador before the end of the eighteenth century. More recently they have opened missions in Australia, Alaska, and on the borders of Tibet. In 1900, all the Eskimos at their four stations in Greenland having become Christians, they transferred their Greenland mission to the Danish church. In their other fields they had in June, 1914, 367 European and American missionaries, 111 native missionaries, and 2059 native workers.

Through such influences and through the writings of Spenser and Francke in Germany and the earnest exhortations of Whitefield and Wesley in England (who had themselves been deeply affected by the writings of Francke and Zinzendorf), and of Jonathan Edwards in America, a resuscitation of personal religion was brought about. At about the same time the travels of Captain Cook revealed the immense extent of the heathen world, while occurrences like the trial of Warren Hastings and the antislavery agitation of Wilberforce brought home to the minds of the English people their responsibility for outrages perpetrated by purely selfish men professing the name of Christians. The time was ripe for action to benefit the sufferers from such outrages. As early as 1779 the English Wesleyans sent a number of missionaries among the North American Indians, and in 1786 they began a mission in the West Indies. In 1814 these beginnings were followed by the organization of a society which has supervised the mission work of that church up to the present time. Its missions lie in Ceylon, India, South Africa, Oceanica, and China. In 1913 this society had in the field 695 missionaries of both sexes, aided by 4826 native workers. In addition there is the Wesleyan Methodist Women's Association, with 108 women missionaries aided by 320 native workers. In general, however, the sudden development of foreign-mission enterprises about the beginning of the nineteenth century did not come from any Church organization. It sprang from the awakening of isolated

individuals whom the Church opposed as unsteady enthusiasts. In 1786 William Carey, a cobbler and a Baptist minister in England, surprised a ministers' meeting by proposing discussion of the duty of foreign missions. He was frowned down by his elders. In 1792, however, he commanded attention and won support. The duty had become plain. In that same year 12 men united to form the Baptist Missionary Society, sending Carey and Thomas as their first missionaries to India. The East India Company would not tolerate missionaries, but they found a safe residence in the Danish colony of Serampore, near Calcutta. The influence of the mission was immediate. Carey's greatest work was that of Bible translation; and the Serampore press, under his direction, added to the slender list then existing translations of Scripture in 34 languages. The Baptist society extended its work in India and added to its field Ceylon, the West Indies, West Africa, and China. In 1913 it had in the field 363 missionaries, men and women, with 905 native workers. The Baptist Women's Missionary Association had (1913) 90 women missionaries and 450 native workers. The example of the English Baptists had effect in all Protestant countries. The reading of Carey's first letters from India led in 1795 to the formation of the London Missionary Society (L. M. S.), in which Independents, Presbyterians, Methodists, and Episcopalians united. Since the other denominations have undertaken missions of their own, this society is now composed substantially of Independents alone. Its present fields are Oceanica, South and Central Africa, Madagascar, India, and China. In 1914 it had in the field 294 missionaries, men and women, and 7480 native workers. Nott, John Williams, Morrison, Medhurst, Rice, Moffat, and Livingstone are names which give special lustre to its roll. In 1796 two similar societies were formed in Scotland, which served at first as auxiliaries to the London society. Later they did good work by themselves in South Africa and the West Indies, and afterward became merged in the missionary societies of the Established church and the United Presbyterian church of Scotland. The formation of a society in Holland in 1797 (called the Netherlands Missionary Society), to aid in the work of the London society, illustrates the solidarity of Christian feeling which underlies the modern missionary movement, and also the failure at first to appreciate the extent of the work committed to a single board of directors by Christians of different denominations and nationalities. The Netherlands Missionary Society furnished several missionaries to the L. M. S., and afterward chose its special field in the Dutch East Indies, where in 1913 it had 65 missionaries and 135 native workers. From this beginning a score of other societies in Holland have sprung for direct and indirect foreign-missionary work. Meanwhile the claims of freed slaves at the Sierra Leone colony were pressed upon the Church of England. Pious men in the employ of the East India Company, like Brown and Grant, urged that church to labor among the people of India. Nothing being done by the church in 1799, 26 of its spiritually minded members, among whom were William Wilberforce, John Venn, and Charles Simeon, organized the Church Missionary Society (C. M. S.), at first known as the Society for Missions to

Africa and the East. They at once encountered opposition on the ground that such enterprises should be directed by the bishops, which made it difficult for them to find fit ministers to go out. Hence the society drew its early missionaries from Germany. Altogether more than a hundred of its missionaries have been Germans, many of them of the highest ability, like Krapf, Rebmann, Rhenius, and Pfander. Nearly half a century passed before the C. M. S. won recognition from the episcopate. The fields of the C. M. S. are in India, Ceylon, China, Japan, West Africa, East Africa and Uganda, Mauritius, Arabia, Persia, Palestine, Egypt, Sudan, and the northern and western parts of British North America. In 1914 it had in the field 1340 missionaries, men and women, and 10,325 native workers, of whom 454 are ordained clergymen. The growth of English interest in missions, combined with the successes of the Halle missionaries of India, led in 1800 to the establishment at Berlin of Jannicke's Missionary School. This school during the next quarter of a century furnished some 80 missionaries to the English and Dutch societies, and served to arouse further interest in missions in Germany. Meanwhile the same ideas were working in America. They found expression in foreign missions through the devotion of Samuel J. Mills and other students at Williams College, who agreed together to give their lives to preaching to the heathen. The earnestness of these young men led to the formation, in 1811, of the American Board of Commissioners for Foreign Missions (A. B. C. F. M.), an interdenominational society. The first missionaries of this society, Newell, Judson, Hall, Rice, and Nott, were sent to India, and were instantly ordered out of the country by the East India Company. Judson and Rice joined the Baptists at Serampore, and the others after some trouble succeeded in getting a footing in Ceylon and at Bombay. Within 10 years the society had occupied other fields in India, in Hawaii, and in Turkey. After some 40 years of existence as an interdenominational society it relinquished some of its fields in India, Persia, Syria, and West Africa to the American Dutch Reformed and Presbyterian churches, who wished to conduct separate missions of their own. It is now supported chiefly by Congregationalists. The A. B. C. F. M. has missions in China, India, Ceylon, South Africa, West Africa, Japan, Turkey, and Oceania. In 1912 the number of its missionaries, men and women, was 615, with 4999 native workers. Judson and Rice, of the first group of missionaries sent to India by the A. B. C. F. M., changed their views on baptism before entering upon their work, and chose Burma for their field of labor. This occurrence led in 1814 to the formation of the American Baptist Missionary Union (A. B. M. U.) to assume the support of the two pioneers in Burma. Its present fields are in Burma, Siam, Assam, India, China, Japan, the Philippines, and the Congo Free State. In 1913 it had in the field 701 missionaries of both sexes, with 8589 native workers.

The success of the early missionaries of these English and American societies aroused an interest which extended to the Protestants of the continent of Europe and led in 1815 to the establishment of a missionary institute at Basel in Switzerland. The training school for missionaries with which this institute began its

operations provided valuable men for the English societies. A magazine for missionary intelligence, published by the institute, deepened missionary interest in Germany and other Protestant countries. In 1822 the Basel institute began to send out missionaries, one of the earliest of whom, Zaremba, labored effectively in Russian Armenia until expelled by the Russian government in 1835. Its present fields are in West Africa, India, and China, and graduates of its school are pastors of evangelical churches in Turkey. In 1913 it had in the field 442 missionaries, men and women, with 1911 native workers. The land of Luther had already contributed men and means for foreign missions during many years before its first foreign-missionary society was formed at Berlin in 1824 by 10 men of mark, among whom were Neander and Tholuck. Following the conservative usage of the continental Protestants, the first work of the Berlin Missionary Society was to establish a training school for missionaries. It began to send men abroad in 1834. Its present fields are in South Africa, German East Africa, and China. It has also done much to draw Christian colonists to the German colonies. In 1912 it maintained 181 men as missionaries in its various fields, with 1339 native workers. During the first part of the nineteenth century a considerable number of little missionary associations had been formed in different parts of Germany to aid existing societies at Basel and elsewhere. Later these developed into the Rhenish, the North German, the Leipzig, the Gossner, and the Hermannsburg Missionary Societies, and have finally won the support of the official representatives of the Church to what is now a large and important missionary enterprise in Africa, India, China, Malaysia, and Australasia. The foreign missions of the Protestants of France began in 1818 with a missionary magazine intended to give information of the work of missionaries of other nations. This was followed in 1824 by the organization of the Evangelical Missions Society of Paris, designed at first to aid existing missions. Since 1825 it has sent missionaries of its own to Central Africa and Senegambia, besides replacing, in consequence of French national prejudices, missionaries of the L. M. S. in Tahiti and Madagascar and American missionaries in the French Congo region. It had, in 1914, 119 European missionaries in its service. The roots of the existing missionary societies in Denmark, Norway, and Sweden also lie in the first quarter of the nineteenth century. These Scandinavian societies expanded during the last quarter of the century, and in 1913 they had 287 men and 395 women missionaries, assisted by 2858 native workers, in Africa, Madagascar, India, China, and Chinese Turkestan. The intimate relations of some of the Scandinavian societies with German, English, and American enterprises, however, make it certain that some of these missionaries are also reported by societies in other countries. In 1824 the Established church of Scotland undertook missionary work in India and among the Kaffirs in Africa, one of its early missionaries being Alexander Duff, the father of educational missions. The disruption in 1843 caused the resignation of all the Scotch church missionaries in India and Kaffria, they preferring to join the Free church, which has since carried on extended missionary operations. In

1900 the Free church joined with the United Presbyterian church in forming the United Free church of Scotland. This body has missions in India, Africa, Arabia, Syria, Turkey, China, West Indies, and the New Hebrides. It had, in 1913, 545 missionaries, men and women, and its force of native workers is 2842. As to the Established church of Scotland, after recovering from the effects of the disruption, it pressed its missionary enterprises, and in 1913 it had in India, Central Africa, China, and Turkey 116 missionaries of both sexes, with 244 native workers. These Scottish mission enterprises are carried on by the Church organizations, and not by independent missionary societies.

The Bible societies grew out of the same religious quickening which gave rise to the voluntary missionary societies (the British and Foreign Bible Society, 1804, the American Bible Society, 1816, the Netherlands Bible Society, the Scottish National Bible Society, and others). So far as concerns their publications in the languages of non-Christian peoples these societies do foreign-missionary work in the very highest sense, since no Protestant foreign mission can exist without the Bible in the language of the people among whom it is working. The Bible societies work in harmony with each other and with the missions. Indeed, missionaries have made the greater part of the translations of the Bible now in circulation. The Bible or parts of it existed in 1914 in almost 600 different forms of speech. The British and Foreign Bible Society has a list of 474 different languages. The Religious Tract Society of London (1799) and the American Tract Society of New York (1820) have done a similar work for foreign missions in aiding to provide general Christian literature in the languages of non-Christian lands.

While our survey indicates the origin of the Protestant missionary movement in the spiritual enlightenment of the Christian Church, it cannot detail its expansion since the first quarter of the nineteenth century. In the second quarter of the century the Methodist church and the Presbyterian church in the United States, previously occupied with missions among the American Indians, began their great missionary enterprises abroad. In many other denominations in the United States, Great Britain, and Europe, foreign-missionary undertakings have been organized. Since the middle of the century foreign-missionary societies have been formed in the colonial churches in Canada, the West Indies, India, Australia, New Zealand, South Africa, and other Protestant colonies. Since 1861, when the first Woman's Foreign Missionary Union was formed in New York, Christian women in all lands have entered upon the work, organizing women's missionary societies, commonly more than mere auxiliaries to the older enterprises. Educational and medical missionary enterprises have been established in considerable number. Interdenominational missionary societies, like the Christian and Missionary Alliance of America and the China Inland Mission and the North Africa Mission of England, have undertaken extensive enterprises in non-Christian countries. To some extent Christian communities which are themselves the fruit of missions have undertaken foreign missions; as in India, Africa, the Fiji Islands, the Hervey Islands, and Hawaii. In India, Ceylon, and South Africa the Salvation

Army has established itself, seeking to forward the evangelization of the heathen by methods peculiar to itself. The Student Volunteer Movement, organized in 1886 in America, but now found in many other lands has done much for the increase of mission interest among students. In 1914 the various missionary societies united in the formation of a Board of Missionary Preparation. Missions have fostered a sense of Christian unity. In India, China, and Japan, and in some other countries, interdenominational conferences of missionaries are regularly held. In south India and Japan union churches have been formed. In the Netherlands, in Germany, in the United States, and to some extent in Great Britain, conferences between the various Protestant missionary societies are held at regular intervals. General and international missionary conferences have been held, of which the last and most important was held at Edinburgh in 1910.

3. *Methods and Problems of Foreign-Mission Work.*—As to the methods used in the presentation of the gospel experience has developed certain principles, almost attaining to the quality of a science of missions. Preaching in the language of the people is the first and most important method of evangelization; and the establishment of a permanent preaching place, to which all may come if they choose, is a first concern in every missionary station. Need at once appears to place the Bible in the hands of the people. This fixes literary work as another method of evangelization. Qualified missionaries translate the Bible, set up presses and print it, prepare helps to its study, tracts, and general Christian literature, and in short apply the enormous influence of the printing press to the enterprise of making Christ known. In 1913 the British and Foreign Bible Society published 1,170,000 Bibles and portions in India and Ceylon, 2,183,000 in China, 300,000 in Africa, and 633,000 in the Japanese Empire. The American Bible Society in the same year printed 29,579 Bibles, 134,689 Testaments, and 2,573,120 portions abroad. Desire that the people shall read requires not only the printing of primers, but the establishment of schools. But every school gives unsurpassed facilities for moral and spiritual culture, and this in proportion to the importance of its general training. Hence educational work has an importance as a method of evangelization which is immeasurable where the quality of instruction is of the best and the spiritual power of the teachers is of the highest. In 1910 there were, under the direction of Protestant missionaries, 30,300 primary schools and kindergartens, with 1,295,954 pupils of both sexes, and 2624 higher educational institutions, with 204,128 students; 86 of the last-named institutions are universities and colleges attended by 8628 students of both sexes. Theological and normal schools and training classes had 12,761 enrolled in 1910; boarding and high schools, 166,447; industrial training institutions and classes, 16,292. Medical work is another powerful method of evangelization. Protestant foreign missions in 1910 possessed 576 hospitals and 1077 dispensaries, in which 4,235,375 individuals received treatment during the year. A most pervasive method of evangelization is consistent Christian living. This includes not only Christian family life, which in itself is an object lesson for non-Christians, but also social intercourse with the people and a

wide variety of works of philanthropy, both in times of famine and pestilence and in the daily contact of ordinary life.

As soon as converts have been won, there arises the problem of their organization and culture as a body having self-control, initiative, and the power of expansion. The results of missionary work cannot be permanent unless the Christian Church becomes indigenous on the foreign field. Hence the members of native churches must early be accustomed to manage their own affairs and to support their own church institutions and their schools. Missionaries rarely become pastors of the local churches, and in general avoid settling local ecclesiastical questions except in conjunction with the local ministers.

Whatever the ability and common sense of the missionary, attack is probable upon him by vested interests represented in the religion of the country where he would preach. The murder, during 1900, of 135 British, Swedish, and American missionaries in China was a tragedy of missions more than once paralleled in quality, though not recently in degree. In this connection a problem arises as to the right of missionaries to ask government protection. It is generally held that missionaries should not depend upon such protection; that they go among savage tribes at their own peril, and that in lands where laws and treaties exist they must obey the laws. On the other hand, a government jeopardizes the right of all its people residing in any foreign country when it neglects to defend such of them as are maltreated while engaged in lawful occupations.

4. *Results of Missions.*—General statistical tables of Protestant foreign missions are seldom perfect. Nevertheless, the following figures may be taken as a fairly accurate statement of the activities of the various missionary societies operating from the countries named for the year 1914.

COUNTRIES	Stations and outstations	Men and women missionaries	Native laborers	Communicants	Added last year	Under instruction	Income
United States.....	14,802	6,282	39,825	972,655	110,194	†450,158	\$11,549,390
Canada *.....	461	509	796	15,582	1,061	6,969	563,998
Great Britain and Ireland...	19,495	7,158	43,002	720,572	36,355	844,848	9,615,032

* For 1910.

† Including teachers.

Again, foreign missions have not merely planted Christianity in all the principal non-Christian lands of the world; they have added the Bible to the literature of all the great languages of the earth, placing before the eyes of the people the principles of true manhood and its model in the peerless figure of Jesus Christ. The British and Foreign Bible Society in 1913 issued a total of 8,958,233, the American Bible Society 5,251,176, and the National Bible Society of Scotland a total of 2,697,886 Bibles, Testaments, and other parts of Scripture. Results of missions visible to the eye in non-Christian lands, but not capable of record in statistics, are the overthrow of degrading superstitions, the limitation or extinction of immoral and cruel customs, the modification of non-Christian religious teaching, the gradual elevation of the standing of woman, the quickening of general intelligence, and the wide introduction

of education among illiterate and degraded races, together with the addition of great territories to the area of the world's commerce. To this must be added the work done by missions in charitable care for the sick, the blind, the lepers, and outcasts of every class.

Bibliography. For early missions: J. Wyse, *A Thousand Years; or, The Missionary Centres of the Middle Ages* (London, 1872); Charles Merivale (ed.), *Conversion of the West* (5 vols., New York, 1879); L. C. Barnes, *Two Thousand Years of Missions before Carey* (Chicago, 1901); George Smith, *Short History of Christian Missions* (Edinburgh, 1904). For modern missions, the reports of the societies, annals of particular missions, and lives of individual missionaries, constitute a great mass of material. A bibliography of this literature to the end of 1890 by S. M. Jackson may be found in E. M. Bliss, *Encyclopædia of Missions* (New York, 1891, 2d ed., ib., 1904), continued by J. S. Dennis in his *Foreign Missions after a Century* (New York, 1893). For a general view of the missionary operations of various societies and discussions of the theory of missions, consult the *Reports of the World Missionary Conference in Edinburgh in 1910* (New York, 1910). For the history of Protestant missions: G. A. Warneck, *Abriss einer Geschichte der protestantischen Missionen von der Reformation bis auf die Gegenwart* (8th ed., Leipzig, 1904; Eng. trans. by John Robson, *Outline of the History of Protestant Missions*, 8th ed., Edinburgh, 1906). For the study of the mission fields and the results of missions: J. S. Dennis, *Christian Missions and Social Progress* (3 vols., New York, 1897-1906); the appendix to this work, *Centennial Survey of Foreign Missions* (ib., 1901), has a very complete collection of statistics; also Dwight, Tupper, and Bliss, *Encyclopædia of Missions* (ib., 1904). For more general discussion: W. N. Clarke, *A Study of Christian Missions* (New York, 1900); E. T. Churton, *Foreign*

Missions (London, 1901); A. T. Pierson, *The Modern Missions Century* (ib., 1901); E. A. Lawrence, *Modern Missions in the East* (Chicago, 1901); Andrew Murray, *The Key to the Missionary Problem* (New York, 1902); R. E. Speer, *Missionary Principles and Practice* (ib., 1902); H. H. Montgomery, *Foreign Missions* (ib., 1902); H. P. Beach, *Geography and Atlas of Protestant Missions* (ib., 1902-03); R. A. Hume, *Missions from the Modern View* (ib., 1905); L. M. Hodgkins, *Via Christi: An Introduction to the Study of Missions* (ib., 1910); J. S. Dennis, *World Atlas of Christian Missions* (ib., 1911); Louise Creighton, *Missions: Their Rise and Development* (ib., 1912); D. L. Leonard, *Hundred Years of Missions* (3d ed., ib., 1913). For the spread of the Church during the first three centuries, the authoritative history is G. A. Warneck, *Die Mission und Ausbreitung des Christentums in den ersten drei Jahrhunderten*

derthen (Leipzig, 1902). For medical missions: John Lowe, *Medical Missions* (New York, 1891); V. F. Penrose, *Opportunities in the Path of the Great Physician* (Philadelphia, 1902); H. O. Dwight, *Blue Book of Missions* (New York, 1905-07), is a pocket compendium of statistics and other missionary information. See also the various publications of the Student Volunteer Movement.

B. Roman Catholic Foreign Missions. 1. *Central Administration.* *The Congregation of the Propaganda.*—In a general way the direction of all Roman Catholic missions is vested by the holy see in the Roman congregation *De Propaganda Fide*, established in 1622 for Roman Catholic missions by Gregory XV. It consists to-day of 25 cardinals, with a cardinal prefect as their head, and a number of prelates and consultors in charge of the various details of administration. The congregation has at Rome its own palace or bureau, a college, a library and museum, a polyglot printing press, and certain fixed revenues, chiefly from domestic or Italian sources. The various missions are distributed by it according to the character of its subjects and the nature of the religious orders to which they belong. It settles finally all disputes between missionaries, whether they regard territorial jurisdiction or the conduct of the missionary work. The regular reports made by missionary bishops or superiors to the holy see pass through the congregation, and in general it acts as agent for missionaries in all matters that regularly pertain to other Roman congregations; e.g., questions of Tridentine law, marriage and divorce, criminal questions, and the like. Its principal meeting is on the first Monday of every month. A weekly meeting is regularly held for minor matters. Among the most important attributes of this congregation is the selection of bishops. Where there is a regularly established hierarchy, a list of three names is submitted to the Propaganda with all the documents pertaining thereto. These candidates are discussed in the regular monthly assembly of all the resident cardinals, and he who seems the most worthy is proposed to the Pope. This privilege of recommendation, in whatever way it be exercised, differs entirely from the election of a bishop, which belongs to cathedral churches by virtue of the regular canon law. In some countries, as in Canada, and formerly in the United States, the provincial bishops alone recommend the three candidates. In other countries, as in England, Scotland, and Ireland, the clergy or the chapter (i.e., the canons of the cathedral), as the superior part of the clergy, draw up a list which the bishops of the province confirm with their approbation or reject with animadversion on one or the other or all of the candidates. Elsewhere, as in the United States since 1884, and in Australia, the clergy or representative part of the clergy recommend three names to the bishops of the province, who in turn recommend these or others to the holy see. When there is no regular hierarchy vicars apostolic are appointed, with episcopal character, from a list of three names drawn up by the superiors of the religious institute or order to which the care of the faithful has been already committed. In the absence of such action the Pope appoints a vicar apostolic on recommendation of the Propaganda. On account of the rapid growth of Catholicism, chiefly in English-speaking countries, the office of Cardinal Prefect of the Propaganda has become one

of the most important and responsible of the great curial offices; he is often called the Red Pope.

The College of the Propaganda is an institution attached to the congregation for the purpose of training its missionaries from their very youth. It owes its first beginnings to the Spaniard John Baptist Vivés, who bequeathed to it his palace at Rome and made it his heir. Since 1622 the original foundation has been greatly enlarged. Urban VIII was a notable benefactor of the work (1641); hence it bears the name of Collegium Urbanum. Some canons of the Lateran Church were the first teachers of the young missionaries, but the college soon passed into the complete control of the new congregation. It was endowed with many privileges by the popes. They exempted it from all ordinary ecclesiastical and civil jurisdiction, and several special distinctions were granted it, among others the right of giving degrees in theology and philosophy. Its present quarters were designed by Bernini, and the chapel is the work of Borromini. Seven months after their entrance the candidates for the missions are required to take an oath of obedience to the congregation; among other things they promise to go directly to their respective missions after ordination. Those who remain as missionaries in Europe (e.g., in the British Isles, the northern kingdoms, Switzerland) are required to report annually to the prefect of the congregation; those whose missions are elsewhere must write to him biennially. Not a few candidates, especially from the Orient, come at an early age. Such youths do not take the missionary oath until after they have reached their fourteenth year. In this college the training is the usual seminary training. Only, for the beginners, Greek and Latin, and especially the suitable Oriental languages, make up the curriculum. The college owns near Rome its own country seat or villeggiature, whither the students go during the heated season. On Pentecost one of the students of the college preaches before the Pope and the cardinals. Its students at the end of the eighteenth century were about 140; at present they do not exceed 120. The French Revolution caused it to close its doors; but since 1809-17 it has been opened for its former work, and many distinguished men have graduated from its classes. From 1836 to 1848 the teaching and discipline were under the control of the Jesuits. Since then they are provided for directly by the congregation itself, which names a rector and vice rector with other officials, and provides for the programme of studies. Several national colleges attend the lectures of its professors—thus, the North American, Canadian, Irish, Greek, Ruthenian, and other national ecclesiastical schools frequent its classrooms. Yearly an *Accademia Polyglotta* is held on the first Sunday after Pentecost. Discourses, poems, and addresses are then read in a great variety of languages, chiefly Oriental, and the ceremony is graced by the presence of many dignitaries of the Roman court. Lately new and commodious quarters have been secured for the academic needs of the college.

The congregation has long owned and managed a printing press that is unique on account of the many kinds of type it possesses for the Oriental languages. In the last two centuries a multitude of Oriental texts have come from its offices—liturgical, ascetic, literary, theological, patristic, historico-religious. There is perhaps no

where else in the world an Oriental printing press so well equipped and so scientifically conducted. It issues regularly a catalogue of its publications, and is officially known as the *Stamperia de Propaganda Fide*.

The Congregation of the Propaganda governs all Catholic missions according to the general law of the church, the decrees of the Council of Trent, the decisions of other Roman congregations, the papal rescripts, and the conciliar legislation. But over and above the ordinary law there is a certain amount of special legislation for the missions and missionaries. As early as 1669 the Propaganda issued its *Advice to Missionaries*, that has been lately reprinted (*Monita ad Missionarios*, Rome, 1874). The details of its extensive legislation are to be found in the collection of its document known as the *Bullarium* of the congregation (Rome, since 1839, 5 vols., folio; with an index, 1858). Another collection is that of Raphael de Martinis (7 vols., folio, Rome, 1889-1900). The particular legislation of the Propaganda affecting the Oriental missions is found in the work entitled *Collectanea Constitutionum, etc.* (Paris, 1880) and in the *Apparatus Juris Ecclesiastici* of Zephyrin Zitelli (Rome, 1886). Occasionally the congregation issues a legislation that modifies the regular canonical procedure in justice, e.g., in the trial of matrimonial cases, clerical delicts, and other judicial processes. Such documents then become norms of ecclesiastical government in the land for which they are issued. The current public documents of the congregation may be easily found in the Roman canon law periodical entitled *Acta Sanctæ Sedis*, and those of the Pope in the annual series of pontifical documents respectively known as *Acta Pii IX*, *Acta Leonis XIII*, etc.

Usually the establishment of a remote and difficult mission begins with the sending of a prefect apostolic by the Pope, at the suggestion of the Congregation of the Propaganda. As a rule this missionary is only a priest, but he receives certain special authorizations from the holy see, e.g., the right to administer confirmation. As soon as the conditions of the mission warrant, a vicar apostolic is appointed to take charge of its interests. Such a missionary is made a titular bishop, i.e., he is given the "title" of some see extinct or suppressed. No specific seat of residence is fixed for him; he organizes the mission as best he can. In time sees are established with territorial limits, and canonical obligation of residence for the bishop; thus a quasi-normal condition arises in which the administration of spiritual affairs gradually grows quite like that of the older Catholic states of Europe, and the regular ecclesiastical law tends to obtain as against the temporary and opportunist administration of an earlier date. Nevertheless, for various reasons, the holy see often continues to govern such well-developed churches through the Congregation of the Propaganda, instead of incorporating them in the ordinary system of its administration. The Propaganda is thus one of the busiest of the Roman congregations. There come before it all questions that arise in missionary lands concerning the creation of dioceses, their dismemberment, division, union, and transformation; the nominations to episcopal office; the relations, in last resort, of bishop and clergy; all questions between bishops and religious orders, and between orders themselves in matters of their mission work; the

discipline and supervision of national missionary colleges, theological seminaries in missionary lands; the regular reports of its bishops, their special needs or plans, and similar things. It is in close contact with all other Roman congregations, to which it acts as a kind of clearing house for the missions and missionaries. Its juridical decisions are final, authoritative, and reversible only by the Pope, to whom they are always submitted beforehand when the gravity of the occasion or the nature of the problem in question warrants. The congregation has a permanent secretary, generally an archbishop, who goes weekly to the Vatican with the proceedings of the congregation, to submit them to the approval of the Pope and give such explanations as are needed. This office is looked on as "cardinalitial," i.e., as leading directly to the dignity of cardinal—hence it is always filled by an ecclesiastic of learning and experience.

A large and valuable library is connected with the congregation, for its own use and for the needs of the college and the printing press. It is especially rich in ancient theology and philosophy, and in all kinds of Orientalia, both printed and manuscript. The archives of the congregation are kept with care, and are of great value for the ecclesiastical and civil history of the missionary lands. They are partially accessible under certain conditions, and are now being used by historians of the sixteenth, seventeenth, and eighteenth centuries, especially for the period of the Counter Reformation in Germany, Switzerland, and the Netherlands.

Until 1862 the affairs of all the missionary churches, East and West, were treated in one and the same Congregation of the Propaganda. In that year Pius IX established a special section of the congregation for the administration of the Oriental churches (*Sacra Congregatio pro Negotiis Ritus Orientalis*). It has its own chief, a Cardinalis Ponens, and its own officials and counselors. To each curial (resident) cardinal of this section is allotted the conduct of the religious affairs of some one of the Oriental rites united with the holy see; he is called the Cardinalis Relator.

2. *National and Particular Direction.*—The principal national missionary enterprises of Roman Catholics are carried on from Paris and Lyons in France. The most venerable of them is the Seminary for Foreign Missions (*Missions Etrangères*), founded at Paris, 1658-63, and located in the Rue du Bac. Its missionaries are under the guidance of local superiors (bishops) throughout China, Chosen (Korea), Tibet, Turkey, Siam, Burma, and Hindustan. In the seminary is a curious and touching Musée des Martyrs. The annual departure of its missionaries from Paris gives occasion for a remarkable popular ceremony and demonstration. The Society for the Propagation of the Faith (*Cŕuvre de la Propagation de la Foi*) was founded in Lyons in 1822 by a few pious lay persons. Its object is not to train or send out missionaries, but to collect and distribute for missionary purposes funds received from private generosity. This distribution is carried out without distinction of location or nationality, a principle which from the beginning differentiated this organization from previous enterprises of a similar nature. The receipts for the year 1822 were scarcely \$4000. In 1898 the association collected nearly seven millions of francs and the total

amount raised by the society in the various countries (France being always far in advance of the others) from the beginning down to 1912 was \$80,349,653. By 1915 it had amounted to \$83,634,380. The society was established in the United States in 1840, and down to 1912 had collected \$3,031,129. Up to 1915 the society had spent \$6,478,714 in the United States. The means adopted for the raising of funds is the payment of five cents per month by the members enrolled in the association. The Work of the Holy Childhood (*Euvre de la Sainte Enfance*), a related enterprise, has collected and spent about \$10,000,000. Other French associations for missionary help are the Work of the Oriental Schools, the annual collection on Good Friday for the Holy Land, the Work of the African Missions, the Anti-Slavery Association, the White Fathers, the Fathers of the Holy Ghost—all works established originally in France and extended to different parts of the world.

There are many religious orders and institutes in France which send numerous members to the mission fields; thus, there are some 800 French Jesuits in the Orient, and they carry on excellent colleges at Beirut, Cairo, and Alexandria. Similarly Lazarists, Dominicans, Assumptionists, and others have numerous missionaries scattered through the Orient. The Christian Brothers have many well-attended schools in Egypt, Syria, Asia Minor, at Constantinople, and in the Levant. Owing to colonial expansion, Catholic Germany has shown more interest in missions during the last three decades, though the earlier French "Works" always found sympathy in Germany. The Bonifacius-Verein (1849) for home missions has spent in the 65 years of its existence over \$7,000,000. The Ludwigs-Verein (1839), the Leopolds-Verein (1839), the Afrika-Verein (1894), the Association for the Holy Land (1893), and other enterprises have kept alive the zeal of German Catholics for the conversion of the heathen. A large number of the German Catholic missionaries are Jesuits. Within the last decade an increasing German missionary activity is manifest, especially in China and Brazil, in which latter country the German colonists increase at a rapid rate.

The French "sisterhoods" give generously of their members to the Oriental missions. Most of the missionaries to the credit of Catholicism are Frenchmen; a still larger proportion of the Catholic "sisters" on these missions is made up of Frenchwomen. Perhaps 10,000 is not too high a number. Of the entire number of congregations of men and women that labor in Catholic missionary fields, over 80 are of French tongue or have their home in France.

While the Spanish missionaries have nearly all taken their way to the Philippines, the Italian missionaries carry on, in an hereditary way, certain lines of work in the Orient, notably in the Levant. Statistics of their number and work are not easily reached. The Salesian Fathers (Turin) of Don Bosco turn their energy towards South America, and the society founded by Bishop Scalabrini, of Piacenza, is especially interested in the Italian population of South America and the North American cities. Holland has had a house for foreign missions at Steyl since 1875, with about 120 missionaries. At Mill Hill, in England, the English Catholics support a seminary for missions among the blacks. The College of All Hallows at Dublin draws its missionaries from Ireland; many of

them come to the United States and merge into the American clergy; Ireland makes provision also for a few missions in Africa and India.

As to the civil relations of the Catholic missions in the Orient, France was their official intermediary with the local governments until the separation of church and state in France, Dec. 9, 1905. This ancient privilege was recognized by late acts of the Prefect of the Propaganda and the Holy Father. It was also recognized anew by the Chinese Emperor in March, 1899. Among the notable acts in the history of Oriental Catholic missions was the establishment by Leo XIII of a regular hierarchy in India (1886) and in Japan (1891).

The support of Catholic missions comes almost entirely from private sources. The money salary of each missionary is a very modest one. The Work of the Propagation of the Faith at Lyons allots annually from \$100 to \$120 to each missionary that it supports. Nearly all the money comes from small contributions, but through a well-organized system of collection.

There are in all some 55 Catholic orders and societies engaged in missionary work, ranging in date of foundation from the Benedictines in 529 to the Foreign Missionary Society of Turin in 1900. Among those most prominently engaged in missionary activities are the Benedictines, Cistercians (Trappists), Dominicans, French Foreign Missions, Minor Franciscans, Capuchin Franciscans, Jesuits, Lazarists, Mazarists, and Oblates of Mary Immaculate. In addition there are over 30 orders of brothers and 175 orders of sisters engaged in mission work as auxiliaries to the missionary priests. There are some 12,000 priests, 4000 teaching brothers, and 40,000 sisters. The entire force of workers in the Catholic missions field now numbers over 60,000.

3. *Some Important Events and Facts in the History of Modern Roman Catholic Missions.*—As a result of the loss of its East Indian possessions the crown of Portugal became involved, during the last century, in long and serious conflict with the holy see. From 1834 to 1838 the latter cut off from the original Portuguese archdiocese of Goa four vicariates apostolic, that coincided with English territory. Though absolutely just and necessary, this act of Gregory XV was resented by Portugal. A schism followed which lasted more or less acutely and continuously until 1886, when peace was brought about by Leo XIII. Goa was made a titular patriarchate with four suffragans, Damão, Archbishop also *ad honorem* of Cranganor, Cochin, St. Thomas of Meliapur, and Macao. Elsewhere in India the former vicariates apostolic of Agra, Bombay, Varapoli, Calcutta, Madras, Pondicherry, and Colombo (Ceylon) were raised to the archiepiscopal rank and freed from all subjection to the archbishopric of Goa.

During the whole nineteenth century the Catholic missions in Tongking and Annam suffered very frequently from popular uprisings and government persecution, until the establishment of the French civil protectorate in 1885-86.

Until 1880 the Catholic missions in Korea were almost continuously the object of similar maltreatment; nevertheless, there was in 1912 a total of 52,109 native Catholics, with 129 chapels and churches, 35 foreign and 10 native priests, and 7 foreign lay brothers. There were also 10 foreign and 57 native sisters. The present religious toleration in Korea under Japanese rule

was unknown in early days. In 1839 three French bishops were put to death as martyrs, and in 1860 nine bishops suffered the same fate.

The modern Catholic missions in Japan began tentatively in 1832-58. An impetus was given by the discovery of a number of crypto-Catholics (1858-72), who had retained some souvenirs of the faith as preached to their ancestors in the sixteenth and seventeenth centuries. With the gradual enlargement of religious liberty since 1872, the disestablishment (1886) of Shintoism and Buddhism, and the proclamation of a constitutional monarchy (1889), the conditions have been more favorable for the Catholic missions. In 1891 Leo XIII established a regular hierarchy in Japan, with one archbishop at Tokio. The three suffragans are at Nagasaki, Osaka, and Hakodate. In Japan (including Korea) in 1912 there were 202 foreign and 48 native priests, 140 lay brothers, 303 sisters, 400 churches and chapels, and 144,984 Catholics.

The labors of the Catholic missionaries in China during the last century were largely directed to gathering back into the Christian fold the families scattered by the former persecutions. The opium war, the Taiping Rebellion, political manœuvres, the weakness of the central authority, and the native hatred of the Chinese for "foreign devils" caused the destruction of many promising Christian communities in spite of the treaties of 1844 and 1850. One cause of the Boxer Rebellion of 1900 was fear of the political activities of the Catholics, especially the French orders, who were more or less supported by the French government. The present constitution of the Chinese Republic grants absolute freedom to all religions. In 1912 there were in China (including Manchuria, Mongolia, and Tibet) 1365 foreign and 721 native priests, 247 foreign and 86 native lay brothers, 743 foreign and 1429 native sisters, 9214 churches and chapels, 7131 schools, 134,057 scholars, and a native Catholic population of 1,406,659.

In Central Africa the most important events have been the labors of Father Libermann and his society (Fathers of the Holy Ghost) since 1840 and the foundation of the Pères Blancs of Cardinal Lavigerie. The African missions have been helped lately by the formation of anti-slavery societies. Among the most remarkable of Catholic missionaries in Africa was Father Daniel Comboni. In Ethiopia the central figure has been the late Cardinal Massaia, a venerable Capuchin, who devoted 30 years of his life to the work. In French Africa the see of Algiers was founded in 1838, and in 1867 became an archbishopric, with Constantine and Oran for suffragans. The French protectorate over Tunis (1881) brought with it, in 1884, the restoration of the famous ancient see of Carthage. Since 1885 the French protectorate over Madagascar has affected somewhat favorably the Catholic missions among the Malagasies.

According to Streit, *Atlas Hierarchicus*, the statistics of Africa for 1912 are as follows: for northeast Africa, 266 foreign and 80 native priests, 400 brothers, 1067 sisters, 190 churches and chapels, 180 schools, 20,557 scholars, and 138,018 Catholics. For northwest Africa, 427 foreign and 5 native priests, 141 brothers, 339 foreign and 27 native sisters, 334 churches and chapels, 564 schools, 40,992 scholars, and 125,300 Catholics. For Central Africa, 810 foreign and 3 native priests, 361 foreign and 14 native brothers, 446 foreign and 31 native sisters, 2426

churches and chapels, 3306 schools, 125,449 scholars, 6410 European and 332,696 native Catholics. For South Africa, 387 foreign and 4 native priests, 360 brothers, 1672 foreign and 22 native sisters, 358 churches and chapels, 363 schools, 28,042 scholars, and 103,880 Catholics. For the African Islands, 188 foreign and 2 native priests, 109 brothers, 195 sisters, 1267 churches and chapels, 182 schools, 32,499 scholars, and 15,300 Europeans and descendants and 223,504 native Catholics. Total for Africa, 2074 foreign and 94 native priests, 1385 brothers, 3819 sisters, 4575 churches and chapels, 4595 schools, 247,589 scholars, and 945,088 Catholics out of an estimated total population of 140,868,051.

As regards British India, the same authority from whom all of these statistics are taken gives the number of foreign priests as 1268, with 1230 native priests, 638 lay brothers, 3592 sisters, 5891 schools and chapels, 3362 schools, 211,035 scholars, and 2,215,632 Catholics. For Asia Minor the figures for 1912 were 527 foreign and 59 native priests, 595 foreign lay brothers, 1187 sisters, 447 churches and chapels, 823 schools, 60,114 scholars, and 138,200 Catholics. For the Philippine Islands the Catholic population is given as 7,455,714, with 963 parish priests, 782 other priests, 29 houses with 559 priests and 195 brothers, 43 houses with 696 sisters, 1339 churches and chapels, 14 seminaries, 32 higher schools, and 10,040 scholars of all kinds. As regards the East Indian islands, in 1912 there were 101 foreign and 2 native priests, 41 brothers, 425 sisters, 112 schools, 9707 scholars, and 37,707 converts, with 180 churches and chapels. In Indo-China the foreign priests numbered 517, with 689 native priests, 149 brothers, 2841 sisters, 4018 churches and chapels, 2986 schools, 73,894 scholars, and 986,597 Catholics. In the Turkish Empire in 1912 the Armenian Catholics numbered 106,000, with 367 bishops and priests; the Syrians 22,200 Catholics and 84 priests, the Syrian Chaldean 64,000 with 251 and the Syrian Maronites 414,600 Catholics with 1517 bishops and priests.

In South America there are nearly 10,000,000 Indians in the various Catholic missions, with some 3,000,000 more unconverted. The separation from Spain, the abolition of slavery in Brazil (1888), the frequent violent expulsion of various religious orders, the movement of immigration from Europe, and the Patagonian missions of the Salesian Fathers since 1875, have been among the principal events that affected the missionary work.

Throughout the islands of Polynesia there were, in 1912, 427 European and 8 native priests, 227 European and 29 native lay brothers, 418 foreign and 120 native sisters, 900 churches and chapels, and a total Catholic population of 193,293.

In 1885 Archbishop Moran, of Sydney, was made a Cardinal and in the same year he held the first council in Australia. There was in Australia in 1912 a total of 828,111 Catholics, 1505 churches and chapels, 1436 various priests, 478 brothers, 5574 sisters, 1181 schools, and 115,178 scholars. In Tasmania and New Zealand there were for the same year 184,876 Catholics, 419 churches and chapels, 388 priests of various kinds, 75 brothers, 164 sisters, 195 schools, and 17,465 scholars.

The most active missionary body of the Roman Catholic church is the Society of Jesus. A quasi-

official statement found in the *Lettres des missionnaires jésuites* (Paris, 1903) gave the number of Jesuit missionaries at that time as 3249. In 1912 they included in their organization 1 cardinal, 11 bishops, 7 apostolic vicars, 7311 priests, 4229 scholars, and 3977 lay brothers. They are active in almost the entire field of missionary work. They are no longer officially sanctioned in France since the separation of church and state, Dec. 9, 1905.

4. *Mission Work in the United States.*—Home-missionary activity in the United States aims chiefly at supplying the spiritual needs of the Indians and negroes. These missions are almost exclusively in the hands of religious orders. In 1885 a special commission was organized to collect and distribute funds for the maintenance of missionaries and schools in the various reservations. Statistics of 1912 claim 64,741 Catholic Indians, with 306 churches, 163 priests, 101 schools, and 7357 scholars; 103,436 Catholic negroes, with 109 churches, 182 priests, 173 schools, and 14,181 scholars.

Another phase of missionary endeavor in the United States is that of missions to non-Catholics inaugurated by the Paulist Fathers in 1893. It consists in explaining by public conference Catholic belief and practice to those non-Catholics who may desire to be enlightened thereon. The idea was soon taken up in various localities, many bishops setting apart a few preachers to carry on this work in their respective dioceses. The movement soon led to the formation of a legal corporation known as the Catholic Missionary Union, and in 1903 to the erection of the Apostolic Mission House in Washington, D. C. This institution is one of the group of those connected with the Catholic University, and its aim is to train young clergymen in missionary methods with a special view to this diocesan work.

Bibliography. For the Propaganda: O. Meyer (Protestant), *Die Propaganda* (Göttingen, 1852); George Phillips, *Kirchenrecht*, vol. vi (Regensburg, 1864); Humphrey, *Urbs et Orbis, or the Pope as Bishop and as Pontiff* (London, 1899). For general statistics: Reliable ecclesiastical geographies, with administrative divisions, subdivisions, maps, and summaries of statistics, are those of O. Werner, *Atlas des missions catholiques* (Freiburg, 1886); id., *Katholischer Kirchenatlas* (ib., 1888); id., *Orbis Terrarum Catholicus*, etc. (ib., 1890). The most recent and valuable of all, with English, French, German, and Italian texts, is K. Streit, *Atlas Hierarchicus* (Paderborn, 1913). In the work of L. E. Louvet, *Les Missions catholiques au XIXème siècle* (Paris, 1898), are to be found an outline history and statistics of all Catholic missions during the last century. Marshall, *Catholic Missions* (London, 1862), is polemical in character; *Die katholische Kirche* (Leo-Gesellschaft, Vienna, 1898 et seq.) is a work in several volumes exhibiting a general view of the entire Roman Catholic church. Consult also: Oudin, *Un siècle* (1800–1900) (Paris, 1901); S. J. Neher, *Der Missionsverein, oder das Werk der Glaubensverbreitung*, etc. (Freiburg, 1894); Goyau, *Le Vatican* (Paris, 1898); *L'Annuaire pontifical catholique* (ib., annually). Catholic directories and almanacs: England, Scotland, and Ireland have each a Catholic directory or register. For the United States there are *Hoffman's Catholic Directory* (Milwaukee) and *Sadlier's Catholic Directory* (New York). The ecclesiastical statistics of

France are found in the annual compilation, *Le clergé français* (Paris); those of Canada in *Le Canada ecclésiastique* (Montreal); for Italy one may consult the *Annuario ecclesiastico* (Rome) and the *Guida ecclesiastica d'Italia* (Savona, 1885); for Spain, the *Guida del estado eclesiastico*, published from time to time at Madrid.

French missions: The best account of the missions of the Roman Catholic church in France is that of Kannengiesser, *Les missions catholiques: France et Allemagne* (Paris, 1900). For a summary of this work, consult Shahan, "The Catholic Missionaries in France and Germany," in the *Catholic World* (New York, 1900); also Lacroix, *Dictionnaire des missions catholiques* (Paris, 1863). J. B. Piolet, *Les missions catholiques françaises au XIXème siècle* (6 vols., Paris, 1900–03), may also be consulted.

German missions: The work of Kannengiesser gives the statistics of German Roman Catholic missions to 1900. Consult also the *Schematismus der römisch-katholischen Kirche des deutschen Reiches* (Freiburg, annually); and for Austria, *Schematismus des gesammten katholischen Reiches Oesterreich-Ungarns* (Vienna); *Kloster-Schematismus für das deutsche Reich* (3d ed., Paderborn, 1899); Zak, *Oesterreichsches Klosterbuch: Statistik der Orden und Kongregationen der Kathol. Kirche in Oesterreich* (Vienna, 1911); Goyau, *L'Allemagne religieuse* (Paris, 1899); A. Huonder, *Deutsche Jesuitenmissionäre des 17. und 18. Jahrhunderts* (Freiburg, 1899); Kannengiesser, *Les catholiques allemands* (Paris, 1893); Max Heimbucher, *Die Orden und Kongregationen der katholischen Kirche* (2d ed., Paderborn, 1907); and H. A. Krose, *Kirchliches Handbuch für das katholische Deutschland* (Freiburg, 1907 et seq.).

Mission periodicals: The Congregation of the Propaganda publishes from time to time (1886–1914) the *Missiones Catholicae*, containing official statistics of its missions. The Work of the Propaganda of the Faith publishes frequently each year the *Annales de la propagation de la foi* (Paris), and a similar *Annales* is published by the Work of the Holy Childhood (Lyons). For the African missions there are the *Bulletin des missions d'Afrique* and the *Société antiesclavagiste*, both published annually at Paris. The details of Roman Catholic education in the Orient are found in the periodical *Œuvres des Ecoles de l'Orient* (Paris, annually). An illustrated monthly entitled *Catholic Missions* appears in English, French, and German, and offers popular information concerning all Catholic missionary work (London). Other important periodicals are: *Annalen der Gesellschaft der Verbreitung des Glaubens* (Einsiedeln, 1832 et seq.); *Jahrbücher der Verbreitung des Glaubens* (Cologne, 1829 et seq.); *Das heilige Land* (ib., 1857 et seq.); *Die katholischen Missionen* (Freiburg, 1874 et seq.).

United States missions: The statistics of the native Roman Catholic missions are found since 1864 in the *Reports of the Commission for Negro and Indian Missions* (Baltimore, annually). Previous to that year the voluminous works of J. D. G. Shea, *History of the Catholic Church in the United States* (4 vols., New York, 1886–92); id., *Catholic Church in Colonial Days, 1521–1763* (Boston, 1887), may be consulted; also id., *History of the Catholic Missions Among the Indian Tribes [1592–1854]* (New York, 1876), and id., *Discovery and Exploration of the Mississippi Valley* (2d ed., Albany, 1903); as

well as the numerous writings of Father de Smedt, a Belgian missionary among the Indian tribes of the Far West. Their bibliography is to be found in J. D. G. Shea, *Western Missions and Missionaries* (New York, 1878); also, T. O'Gorman, *History of the Roman Catholic Church in America* (ib., 1895); Francis Parkman, *The Jesuits in North America* (ib., 1902); De Courcy, *History of the Catholic Church in the United States* (ib., 1904); and Zephyrin Engelhardt, *Missions and Missionaries of California* (3 vols., San Francisco, 1908-13).

For the Philippines, see Fidel de Blas de la Asunción, *Labor evangélica de los padres recoletos en las Islas Filipinas* (2d ed., Saragossa, 1910).

For the Near and Farther Orient: Charles Dallet, *Histoire de l'église de Corée* (Paris, 1874); De l'Huys, "Le Christianisme au Tonkin," in *Le Correspondant* (ib., 1889); Adrien Launay, *Atlas des missions de la Société des Missions Etrangères* (ib., 1890); id., *Nos missions: album des missions catholiques* (Lyons, 1900); Léon Joly, "Missions catholiques de l'Indo-Chine, de la Chine, et de la Corée," in his *Le Christianisme et l'extrême Orient*, vol. i (Paris, 1907); Fernández, *Misiones Ordinis Fratrum Minorum in Sinis et in Japonia an. 1908-09* (Quaracchi, 1910). For India: Father Leo, *The Capuchin Mission in the Punjab* (Mangalore, 1910); the *Catholic Directory of India for 1913* (Madras, 1913). On the Catholic missions in Australia: Lemire, *Le Catholicisme en Australie* (Paris, 1900); also the *Australasian Catholic Directory for 1912* (Sydney, 1912). For the religious disturbances in China at the close of the last century, consult articles in *Le Correspondent* (Paris, July 25 and Aug. 10, 1900). Much valuable information of this period is also found in Cordier, *Histoire des relations de la Chine avec les puissances occidentales*, vol. iii (Paris, 1902). For details of earlier Catholic missions in China consult the Abbé Huc, *Le Christianisme en Chine, en Tartarie et en Thibet* (Paris, 1859). Recent statistics are found in Calendrier, *Annuaire pour 1912* (Shanghai, 1912). For other books on

China, see *Aperçu historique sur la Chine* (Rome, 1873); Hubner, *Ein Spaziergang um die Welt* (Leipzig, 1875); J. E. Reiffert, *Zehn Jahre in China* (Paderborn, 1896); Bertram Wolferstan, *The Catholic Church in China* (St. Louis, 1910). For other parts of the Orient: Müllinen, *Die lateinische Kirche im türkischen Reiche* (2d ed., Berlin, 1903); Silbernagl, *Verfassung und gegenwärtigen Bestand sämtlichen Kirchen des Orients* (2d ed., Regensburg, 1904); Lubeck, *Die christlichen Kirchen des Orients* (Kempten, 1911). See also the periodical *Echos d'Orient* (Paris, 1898 et seq.).

For Africa, besides the periodicals named, see *Geographie de l'Afrique chrétienne* (Paris, 1892), and F. Klein, *Kardinal Lavignerie und sein afrikanisches Werk* (Strassburg, 1893).

MISSISAGA, mis'si-sā'gā or -sā'gā. An Algonquian tribe of North American Indians residing east and south from Lake Ontario, Ontario, Canada. They are closely connected with the Ojibwa, of whom they are an offshoot. The name is said to mean "great mouth," referring to the mouth of the Missisaga River. When first known to the French, early in the seventeenth century, the Missisaga were living upon the lower part of the river which bears their name and upon the adjacent Manitoulin Island. Soon afterward they moved east and south into the country left unoccupied by the dispersion of the Huron and Ottawa and soon spread over the whole peninsula of Lower Ontario. At the close of the Revolution they even had one village on the south side of Lake Erie in what is now Ohio. The land on which the Iroquois are now settled on Grand River, Ontario, was bought from the Missisaga. On account of the former loose distinction between the Missisaga and Ojibwa, it is impossible to give exact figures of population. Those now officially classed as Missisaga number about 750, on small reservations at New Credit, Alnwick, Mud Lake, Rice Lake, and Seugog, Province of Ontario, Canada. They are all members of the Methodist church and support themselves by farming, fishing, trapping, gathering wild rice, basket making, and outside labor.

KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā	as in ale, fate.	ch	as in chair, cheese.
ā	" " senate, chaotic.	ɔ	" " Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then.
ā	" " glare, care, and as <i>e</i> in there.	g	" " go, get.
ā	" " am, at.	g	" " German Landtag = <i>ch</i> in Ger. ach, etc.
ā	" " arm, father.	h	" " <i>j</i> in Spanish Jijona, <i>g</i> in Spanish gila; like English <i>h</i> in hue, but stronger.
ā	" " ant, and final <i>a</i> in America, armada, etc.	hw	" " <i>wh</i> in which.
a	" " final, regal, pleasant.	k	" " <i>ch</i> in German ich, Albrecht = <i>g</i> in German Arensburg, Mecklenburg, etc.
a	" " all, fall.	n	" " in sinker, longer.
e	" " eve.	ng	" " sing, long.
e	" " elate, evade.	n	" " French bon, Bourbon, and <i>m</i> in the French Étampes; here it indicates nasalizing of the preceding vowel.
e	" " end, pet.	sh	" " shine, shut.
e	" " fern, her, and as <i>i</i> in sir, etc.	th	" " thrust, thin.
e	" " agency, judgment.	th	" " then, this.
i	" " ice, quiet.	zh	" " <i>z</i> in azure, and <i>s</i> in pleasure.
i	" " quiescent.		
i	" " ill, fit.		
ō	" " old, sober.		
ō	" " obey, sobriety.		
ō	" " orb, nor.		
ō	" " odd, forest, not.		
o	" " atom, carol.		
oi	" " oil, boil.		
ōō	" " food, fool, and as <i>u</i> in rude, rule.		
ou	" " house, mouse.		
ū	" " use, mule.		
ū	" " unite.		
ū	" " cut, but.		
u	" " full, put, or as <i>oo</i> in foot, book.		
ū	" " urn, burn.		
y	" " yet, yield.		
B	" " Spanish Habana, Córdoba, where it is like English <i>v</i> but made with the lips alone.		

An apostrophe ['] is sometimes used as in *tā'b'l* (table), *kāz'm* (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as *g*, *h*, *k*, *n*, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME XVI

THE NEW INTERNATIONAL ENCYCLOPÆDIA

MISSISSIPPI, mī'sī-sīp'ī. One of the South Central States of the American Union. It takes its name from the river which forms its west boundary for a distance of about 300 miles and separates it from the States of Louisiana and Arkansas. It lies between Tennessee on the north and Louisiana on the south, being separated from the former by the thirty-fifth parallel of north latitude and from the latter by the thirty-first parallel from the Mississippi River to the Pearl River, a distance of 110 miles. Thence following the Pearl River southward the boundary line is completed on the south by the Gulf of Mexico. The Tennessee River cuts off a small portion from the northeast corner, but the east boundary separating the State from Alabama runs southward in a nearly straight line to the Gulf. Mississippi has an extreme length of 330 miles and an extreme width of 188 miles, and comprises an area of 46,665 square miles, of which 303 square miles is water. Mississippi includes, in addition to the mainland territory, the islands Ship, Horn, Cat, Petit Bois, and others, separated from the mainland by the Mississippi Sound.

Topography. The highest ridges in the northeast reach an altitude of about 700 feet. Throughout most of the State elevations range from 350 to 500 feet to about 150 feet a few miles from the Gulf. A moderate uplift of the region has allowed the rivers to carry the work of dissection to maturity, all gradients now being low, nearly or quite at base level. The streams have their lower courses in valleys opened wide, from a few hundred yards to several miles, and wandering in sinuous courses upon silted bottoms. These river bottoms cover a total of 7560 square miles, or over one-sixth of the entire State. Of this the Yazoo bottoms occupy the greater part. The flood plains of the Yazoo and Mississippi rivers are lined on the east by bluffs from 100 to 300 feet in height, caused by the lateral corrosion of the swinging meanders of the great river. These bluffs are capped throughout with a deposit of loess. Extending through the middle of the Yazoo bottoms is a flat ridge standing above flood level. This and the banks of the various streams are available for cultivation, being the best cotton land in the world. The bottom is being steadily reclaimed for plantations. The swamp and marsh area is occupied by cypress trees, very valuable as lumber, while

the drier lands are covered with cane brakes and rich forests of many species of timber trees.

Hydrography. The principal rivers are the Mississippi, flowing the entire length, the Tombigbee, Big Black, and Pearl. The Yazoo River is a distributary of the Mississippi and the whole area of its bottom is a mesh of interlacing streams, bayous, and oxbow lakes. About one-half the area of the State drains directly into the Mississippi. The Pascagoula drains most of the southeastern quarter. The bottom lands of the Mississippi and other rivers are liable to overflow when the rivers are flooded. To guard against this, levees, or artificial banks, are built to restrain them. See **LEVEE**; **MISSISSIPPI RIVER**.

Flora. The result of the rather large annual rainfall and of the equable distribution through the year is best seen in the luxuriant forests, largely of deciduous trees. Over 125 species of forest trees are known. There are 15 species of oak, including the live oak. Cypress predominates on the bottom and swamp lands. The long-leaved pine is the chief forest tree of the southern half of the State. Tupelo, sycamore, persimmon, magnolia, holly, cucumber tree, sweet gum, black walnut, and various species of hickory, elm, and maple are also present.

Climate. Mississippi lies in the warm temperate climatic belt and its climate is strongly influenced by reason of its proximity to the Gulf. The average January temperature is 55° F. in the islands off the coast, 50° F. in the southern part of the mainland, and 40° F. near the north boundary. The average July temperatures range from 80° F. to 87° F. The average maximum shade temperature is 100°, while occasional anticyclones of winter bring a minimum temperature of 10° F. to the southern portion and zero weather to the portions below the northern quarter. Such cold weather is, however, very infrequent. The frost-free growing season lasts seven months in the north and ten months in the south. This is of the very greatest importance to many of the crops, especially cotton. The average annual rainfall for the whole State is over 50 inches. The southern quarter has over 60 inches, this distribution being largely due to the prevailing southwest winds and to the influence of the Gulf. The heaviest rains occur in late winter or early spring, when the warm Gulf winds meet the cold winds, but on the whole the precipitation is quite evenly dis-

tributed through the year. There is a slight snowfall as far south as Natchez. The atmosphere is humid at all seasons, the average annual relative humidity being not far from 70 per cent in the northern half and from 70 to 75 per cent in the southern half. The average wind velocity for the whole year is seven miles per hour. The prevailing wind for January is north, while it is south for July. The cyclonic belt lies far to the north and generally does not touch the State.

Soils. The soils are pretty closely correlated with the geology. In the northeastern corner cherty and gravelly soils are common. The Selma Chalk or Rotten Limestone, the most extensive division of the Cretaceous, gives rise to a very fertile calcareous clayey soil, now mostly under cultivation. A narrow belt at the inland edge of the Tertiary formations, extending from the Tennessee line to the Alabama line, known as the post oak flatwoods, is characterized by stiff clay soils of very little agricultural value. In the eastern central part of the State reddish loams prevail. A little south of the centre there is another calcareous strip, formed by the Jackson and Vicksburg formations, and south of that sandy soils, rather poor, but easily tilled and responding generously to proper fertilization.

The brown loam and loess in the western half of the State, extending from about Holly Springs, Jackson, and Brookhaven to the river bluffs, make a very fertile soil, and the alluvium of the delta is one of the richest soils in the world. Much of the last is as yet too swampy for cultivation, but it is being gradually drained by levees and ditches. The loess is very easily eroded, and large areas of it have been so cut up by gullies since the country was first settled as to make the land almost worthless.

Geology. The Cumberland Ridge just reaches the northeast corner of the State with its outlying undulations, thus bringing a small outcrop of Devonian and Subcarboniferous rocks into its borders. From this corner as a focus the younger strata dip away gently to the west and south. Cretaceous beds cover a belt radiating about 25 miles west and 75 miles south of the northeast corner. The four prominent members of the Cretaceous outcrop, in series from the oldest up, are the Tuscaloosa, Eutaw, Selma Chalk, and Ripley. The total thickness of these beds is 2000 feet. At the close of Cretaceous time there was a deep gulf extending north to Cairo, Ill., which was slowly filled by fluvial and offshore deposits. These beds are the Eocene and Neocene outcrops, covering the greater part of the State and extending from the Cretaceous on the northeast to the Yazoo bottoms and almost to the Gulf on the south.

Mineral Products. The only activities of Mississippi as a mineral-producing State are the output of clay, sand, and gravel, and the production of mineral waters. Some iron ore and sand-lime brick have been worked, but are of no importance. The clay products in 1913 were valued at \$691,271. In the same year there were produced 1,891,663 short tons of sand and gravel, valued at \$430,401. The production of commercial mineral waters in 1913 was 346,652 gallons, valued at \$81,800. The total value of the mineral production in 1913 was \$1,143,472.

Agriculture. Mississippi is preëminently an agricultural State. Of the approximate land area of 29,671,680 acres, in 1910 there were 18,557,533 acres in farms, of which there num-

bered 274,382. Improved land in farms included 9,008,310 acres. The average number of acres per farm was 67.6 in 1910. The total value of farm property, including land, buildings, implements, machinery, domestic animals, and poultry, was, in 1910, \$426,314,634. There were, in 1910, 274,382 farm operators, of whom 92,891 were owners, 825 managers, and 181,491 tenants. The share of the farms operated by tenants increased from 43.8 per cent in 1880 to 66.1 per cent in 1910. The land in farms owned and operated by white farmers in 1910 was 12,100,106 acres, with 4,520,927 acres improved land, and by negroes 6,457,427 acres, with 4,487,383 acres improved. Acreage operated by white owners was 9,489,280 and by negro owners 21,227,194. The average acreage per farm operated by white farmers was 110.4 in 1910 and for negroes 39.2. More than three-fourths of all the farms were between 10 and 99 acres in size. The native white farmers in 1910 numbered 108,909 and foreign-born white farmers numbered 736. Negro and other nonwhite farmers numbered 164,737, or 60 per cent of the total number. The acreage, production, and value of crops shown in the following table are estimates for 1914 made by the United States Department of Agriculture.

PRODUCTS	Acreage	Prod. bu.	Value
Corn.....	3,150,000	58,275,000	\$42,541,000
Oats.....	160,000	3,680,000	2,392,000
Potatoes.....	12,000	960,000	912,000
Sweet potatoes..	50,000	4,500,000	2,835,000
Hay.....	210,000	*304,000	3,648,000
Rice.....	1,000,000	30,000	26,000
Cotton.....	3,120,000	†1,275,000	41,512,000

* Tons.

† Bales.

The total value of crops in 1909 was \$147,316,000 and the acreage 6,158,719. The leading crops in the order of their importance are cotton, corn, cottonseed, hay and forage, and sweet potatoes and yams. The acreage of cotton in 1909 was 3,400,210. The production was 1,127,156 bales, valued at \$83,148,805. The chief acreage of cotton is found in that section described as the Yazoo delta or bottoms. In acreage of cotton Mississippi ranked fourth in 1914, being surpassed only by Texas, Georgia, and Alabama.

Corn is the leading cereal produced; its acreage in 1909 was 2,172,612. The production was 28,428,667 bushels, valued at \$26,030,376. Of the remaining cereals only oats are important. In 1909, 97,085 acres were harvested, producing 1,268,675 bushels, valued at \$822,932. The acreage of hay and forage in 1909 was 229,705, producing 279,236 tons, valued at \$3,363,647. The growing of peanuts is given considerable attention. The total acreage in 1909 was 13,997, and the production amounted to 284,791 bushels, valued at \$317,236. A small quantity of tobacco is grown, and this in 1909 amounted to 18,600 pounds, valued at \$3390. The total acreage of potatoes and other vegetables in 1909 was 125,610, and their value \$9,483,576. Excluding potatoes and sweet potatoes and yams, the acreage of vegetables was 61,223, and their value \$5,868,000. There were grown, in 1909, 1,634,305 bushels of orchard fruits, valued at \$1,325,506. Of these the most important in quantity and value were peaches. Second in product and value were apples; third, plums and prunes. There were also grown, in

1909, 760,563 pounds of grapes, valued at \$44,262. Of the small fruits grown the most important is the strawberry, of which 1,345,013 quarts, valued at \$101,882, were produced. Among tropical fruits, figs, oranges, and pomeloes are grown. The production in 1909 was 1,949,301 pounds, valued at \$107,609. Mississippi is one of the most important sugar-cane-producing States. There were grown, in 1909, 222,600 tons, from which were made 1665 pounds of sugar and 2,920,519 gallons of sirup, the latter valued at \$1,494,696.

Live Stock and Dairy Products. The total number of cattle of all kinds in 1910 was 1,012,632, with a value of \$15,269,264. On Jan. 1, 1915, the estimated number of cattle other than milch cows was 514,000, with a value of \$7,350,000; milch cows, 434,000, valued at \$15,190,000; horses, 241,000, valued at \$20,726,000; mules, 292,000, valued at \$31,536,000; sheep, 208,000, valued at \$458,000; swine, 1,540,000, valued at \$11,088,000. The total value of the milk, cream, and butter fat sold and butter and cheese made in 1909 was \$6,003,465. The milk produced amounted to 79,079,293 gallons, the butter made to 28,730,685 pounds, valued at \$5,571,011. Fowls of all kinds in 1909 numbered 5,070,000, valued at \$1,846,750. The production of eggs was 17,700,000 dozen, valued at \$3,151,000.

Fisheries. Biloxi is the centre of the wholesale fishing industry. It is the shipping point of large quantities of canned and prepared oysters and shrimps. Mollusks and crustaceans are the principal products of the fisheries, of which oysters are by far the most important. In the year 1908 the valuation of the fish caught was \$295,000. Buffalo fish, sea trout, white mullet, catfish, and paddlefish are, in the order named, the principal species. In that year there were 2037 persons engaged in fisheries, and the capital invested was \$522,000. The total production was valued at \$556,000. The industry seems to be declining in the number of persons engaged and the value of products. This is probably due to a decision of the United States Supreme Court transferring the jurisdiction of the Pear Island oyster and fishing grounds to Louisiana. The chief fishing grounds are the Gulf of Mexico and the Mississippi River.

Forest Products. In 1908, 17,500,000 acres, about 59 per cent of the total area, were covered by forests. As noted in the section on *Manufactures*, the lumber industry is the most important single manufacturing industry in the State. In the production of rough lumber, 2,610,581 M feet B. M., Mississippi ranked third among the States. By far the greatest percentage of the cut was yellow pine. The other principal varieties sawed, in the order of their importance, were oak, gum, cottonwood, cypress, poplar, hickory, ash, tupelo, and elm. There were manufactured, in 1909, 151,303 thousands of shingles and 90,926 thousands of lath. In the same year there were produced 1,589,000 gallons of turpentine valued at \$732,000, and 27,020 tons of resin valued at \$740,000. There were, in 1913, 908 active saw mills. The lumber produced in 1914 was valued at \$42,793,000. In addition to the figures of lumber given above, there were taken from the farms in 1909 forest products valued at \$6,602,943.

Manufactures. While Mississippi is not essentially a manufacturing State, its industrial importance has kept pace with its growth. In 1909 the gross value of products per capita

was \$45. The table on page 4 gives the most important figures relative to manufactures for 1909 and 1904. The most important single industry is that connected with lumber and timber products. This is treated in detail under *Forest Products*. The manufacture of cottonseed oil and cake ranks second in value of products. In 1909, 559,357 tons of cottonseed were crushed, and from it were manufactured 24,386,289 gallons of cottonseed oil, 244,738 tons of meal and cake, 181,797 tons of hulls, and 24,237,536 pounds of linters. Mississippi has shared in the remarkable development of cotton manufactures in the Southern States. The manufacture of cotton goods ranks fourth. The principal material used in these manufactures is domestic cotton, of which there were consumed, in 1909, 16,371,192 pounds. The principal product is bleached and unbleached sheetings and shirtings, the output of which amounted to 17,225,461 square yards in 1909. The number of producing spindles was 153,804 in 1909, and the number of looms, 4733. The manufacture of fertilizers is an important industry and ranks fifth. There were made, in 1909, 59,902 tons of superphosphates from minerals, bones, etc., 78,193 tons of complete fertilizers, and 1006 tons of other fertilizers. In addition to these a considerable quantity of fertilizers was produced by cottonseed-oil mills. In the production of turpentine and rosin Mississippi is one of the most important States, although this industry has shown a decline in recent years. Mississippi in 1909 ranked fourth among the States in the output of these products.

The total number of wage earners in 1909 was 50,384, and of these 47,898 were males. The wage earners of 16 years of age and under numbered 1058, of whom 611 were males. The prevailing hours of labor for nearly half the wage earners employed were 60 a week.

The State has five cities having a population of over 10,000—Hattiesburg, Jackson, Meridian, Natchez, and Vicksburg. These cities contained in 1910 only 4.9 per cent of the total population and produced 14.8 per cent of the total value of its manufactures. The most important manufacturing city is Meridian (q.v.), in which there were, in 1909, 1524 wage earners and which had a product valued at \$4,237,476. The cottonseed-oil industry is the most important, followed by the manufacture of fertilizers, steam-railroad repair shops, and lumber mills.

Transportation. Mississippi has excellent transportation facilities. It has direct connection with several large railroad systems of the South and Middle West and is bordered for practically its entire length by the Mississippi River. The proximity to the port of New Orleans by means of this river places it in a favorable position for domestic or foreign shipments. The total railway mileage on Oct. 30, 1913, was 4279. The principal railroads with their main-line mileage in 1913 were as follows: Illinois Central, 679; Yazoo and Mississippi Valley, 1144; Mobile and Ohio, 315; New Orleans, Mobile, and Chicago, 370; Southern Railway, 236; Mississippi Central, 164. The mileage of electric railways on Jan. 1, 1913, was 107. There were 12 companies operating such railways in that year. Pearl River is a customs district and has a small foreign trade.

Banking. The Bank of Mississippi at Natchez was chartered in 1809. In 1818 it was created a State bank, with a capital of \$3,000,-

000, the State participating in its management and pledging a monopoly of its banking business until 1840. In 1830, with the hope of getting more direct control of banking operations, the Legislature broke its pledge by establishing the Planters' Bank of Mississippi, with a capital of \$3,000,000, and making it the financial agent of the State. This forced the first bank into liquidation. For a few years the Planters' Bank had a practical monopoly of the banking, but from 1835 new banks followed in rapid succession. The most daring venture was the organization of the Mississippi Union Bank in 1838, with a capital of \$15,500,000, which made it the largest State bank in the United States at that time. These bold undertakings in the very midst

\$1,787,074; loans, \$33,453,505; and deposits, \$34,416,264. There were 22 loan and trust companies with an aggregate capital of \$1,803,150, and 17 savings banks with a combined capital of \$485,600.

Government. The present constitution was adopted in 1890, and it is the fourth instrument under which the State has been governed. The constitution of 1890 had for its special purpose the preservation of the supremacy of the white vote. (See *Suffrage and Elections* below.) The constitution may be amended by a two-thirds vote of both Houses indorsed by the vote of the people.

Executive.—The chief executive officer is the Governor, who holds office for four years and is

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)				
Expressed in thousands								
All industries.....	1909	2,598	56,761	50,384	\$72,393	\$18,768	\$80,555	\$43,629
	1904	1,520	42,966	38,690	50,256	14,819	57,451	31,650
Bread and other bakery products.....	1909	79	417	285	287	128	878	362

Ice, manufactured.....	1909	51	477	341	1,851	189	866	653
	1904	37	376	274	1,266	119	603	458
Lumber and timber products.....	1909	1,647	37,118	33,397	39,455	12,583	42,793	28,586
	1904	664	24,415	22,431	24,819	9,242	26,162	19,157
Oil, cottonseed, and cake.....	1909	87	3,014	2,503	10,133	833	15,966	3,797
	1904	91	2,956	2,499	8,552	732	12,587	2,517
Printing and publishing.....	1909	225	1,132	736	1,173	387	1,308	1,008
	1904	211	861	549	733	254	916	721
Turpentine and rosin.....	1909	64	2,811	2,573	1,251	582	1,475	1,126
	1904	124	3,036	2,633	598	737	2,366	1,972

of a financial crisis could lead to only one result. In 1841 the repudiation of the charter granted to the Union Bank was the chief political issue in the State. The repudiators won, and the bonds were canceled in 1842. In 1853 the Planters' Bank bonds were also canceled. These acts were upheld by the constitution of 1890. There were numerous failures in 1838-45; in 1855 there was but one chartered bank. A revival came in the eighties, when national banks were introduced. Stringent banking laws have given to the State banks the confidence of the people, and their number has increased. On Sept. 12, 1914, there were 38 national banks with a combined capital of \$3,835,000; surplus, \$1,777,456; cash, etc., \$391,649; loans, \$14,897,834; and deposits, \$16,037,548. On June 30, 1914, there were 266 State banks with a total capital of \$8,604,330; surplus, \$2,003,081; cash, etc.,

not eligible for immediate reelection. Other executive officers are: Lieutenant Governor, Secretary of State, Treasurer, Auditor, Attorney-General. The Treasurer and Auditor may not be candidates for two successive terms.

Legislative.—The Legislature includes the Senate and the House of Representatives. In 1912 the system of sessions once in four years, with a special session between, was changed to biennial sessions in even years. The Lower House includes (1915) 138 members and the Senate 45.

Judiciary.—The judiciary is the supreme or appellate court of the State, which, by constitutional amendment adopted in 1914, consists of six members; a chancery court of equity jurisdiction and a circuit court of common-law jurisdiction in each county. The chancery and circuit judges have heretofore been appointed by the Governor, but are now elective. The coun-

ties are divided into chancery and circuit districts, a chancellor and a circuit judge being chosen for each district. There are in addition two or more justices of the peace elected for each of five districts in a county.

Suffrage and Elections.—Every male citizen 21 years of age who has resided in the State for two years, in the district in which he offers to vote for one year, who has registered and paid taxes for two preceding years, and who is able to read or understand the Constitution of the United States, is eligible to vote. The last qualification, which election officers are given discretion to interpret, was designed chiefly to eliminate a large portion of the negro vote. All voters must pay a poll tax of \$2 for the support of the common schools.

All nominations for the State, district, and county officers and United States Senators are made at primary elections. Each political party pays the expenses of its primaries, and the candidates may be assessed for expenses. General elections are held on the first Tuesday after the first Monday of November.

Local and Municipal Government.—Cities may adopt a commission form of government including the charter providing for the recall and initiative at an election held on petition by 10 per cent of the voters. Any city may vote to abandon its charter after six years under commission government. Each county is divided into five districts, in each of which a resident freeholder is selected as a member of the board of supervisors. The boards of supervisors regulate the fiscal affairs of the county, make all contracts, equalize assessments, levy the taxes, and have exclusive control of roads, ferries and bridges, etc.

Miscellaneous Constitutional and Statutory Provisions.—Women are placed on an equality with their husbands in acquiring and disposing of property and the making of contracts. A divorce may be granted only to one who has lived for one year at least in the State. A public-service corporation which may remove a suit from a State to a Federal court forfeits its right to carry on intrastate commerce in the State. Nine or more jurors may agree on a verdict in civil suits. Contributory negligence does not bar recovery for injuries or death. The giving of tips in hotels is forbidden. As a result of a statute passed in 1908, the State is under prohibition. The Legislature of 1914 passed a measure restricting the intrastate shipment of intoxicating liquors and prohibiting the keeping of liquor in any locker of any social club or any other organization. There are strict regulations for railroad companies delivering intoxicating liquors shipped from outside the State.

Finance. The early financial history of the State is closely connected with the organization of its banks. A large State debt of \$2,000,000 was created in 1830 in order to acquire shares in the Planters' Bank and, in 1838, \$5,000,000 for shares of the Union Bank of Mississippi. These banks were later brought to insolvency as a result of the financial crisis of the thirties. This involved the State in an enormous debt. In the floating of this debt infringements were made upon the constitution, and it was repudiated by a popular vote in 1852. The debt was finally disposed of by a clause in the constitution of 1875. The State was again involved in serious financial difficulties during and after the

Civil War. The "carpet-bag" régime greatly aggravated the situation. The expenditures increased from about \$500,000 in 1867-69 to more than \$1,500,000 in 1871-75, and the tax rate increased from 1 mill to 14 mills. The taxpayers organized a protest in 1874, and a gradual decrease of the State's debt, expenditures, and rate of taxation followed. The total debt in 1880 was \$3,324,084, of which \$530,615 was bonded debt. On Sept. 30, 1912, the total debt was \$4,460,519, of which \$1,506,899 was bonded debt. The funded debt consisted on that date of several series of bonds and of special debt obligations to public trust funds. The latter represent obligations to several educational funds: the principal of which, amounting to \$2,344,674, has been used by the State, for which it pays an annual interest of 6 per cent in perpetuity. The bonded debt on Sept. 30, 1913, was \$3,923,752. The per capita debt in 1912 was \$2.41. There is no sinking fund. The total receipts from all sources for the fiscal year 1913 amounted to \$4,501,447 and the disbursements to \$4,426,591. The balance at the beginning of the fiscal year was \$250,999 and at the end \$325,855. The chief sources of revenue are State taxes, and the chief expenditures are for educational and State institutions.

Militia. The males of militia age in the State in 1910 numbered 345,745. The organized militia consists of one brigade of infantry, comprising the second and third regiments, and a sanitary troop and a field hospital. The total strength of enlisted men in 1914 was 1116 and of officers 104.

Population. The following figures show the growth of the population at various periods: 1800, 8850; 1830, 136,621; 1850, 606,527; 1860, 791,305; 1870, 827,922; 1880, 1,131,597; 1890, 1,289,600; 1900, 1,551,270; 1910, 1,797,114. The est. pop. on July 1, 1914, was 1,901,882; 1920, 1,790,618. In 1910 Mississippi ranked twenty-first among the States. There is a very small foreign-born population, but it has a larger percentage of colored population than any other State. The white population in 1910 was 786,111, and the negro population was 1,009,487. The white population, however, is increasing at a faster rate than the negro. The foreign-born whites in 1910 numbered 9389. The urban (cities of 2500 or more) population is comparatively small. In 1910 this amounted to 207,311. The rural population in 1910 was 1,589,803. The negroes are most numerous in the western or Mississippi valley counties, in some of which they are five times as numerous as the whites. There are about 1250 Indians, who are descendants of the Choctaw tribes which inhabited the State at the time of its settlement. A large number of these Indians have removed to Oklahoma and have become members of the Choctaw nation. In the State in 1910 there were 905,760 males and 891,354 females. The males of voting age numbered 426,953. There were in 1910 only nine cities having a population of 8000 or over. The largest city, Meridian, had a population in 1910 of 23,285 and, in 1914, 21,806 (estimate). The other large cities with their populations in 1910 and as estimated for 1914 are as follows: Jackson, 21,262 and 26,990; Vicksburg, 20,814 and 22,090; Hattiesburg, 11,733 and 14,952; Greenville, 9610 and 10,448; Columbus, 8988 and 10,053; Biloxi, 8049 and 9147; Natchez, 11,791.

Education. Education in Mississippi is car-

ried on under some disadvantages, caused by the large and widely scattered rural population. This fact and a negro population that amounts to more than half of that of the State accounts for the large percentage of illiteracy. The total illiterates in 1910 numbered 290,235 (persons of 10 years and over), a percentage of 22.4. South Carolina and Alabama were the only States with higher percentages. Of the total illiterates the native whites numbered 28,344, or 5.3 per cent, and the negroes 259,438, or 35.6 per cent. Conditions, however, are greatly improving, and the percentage of illiterates is steadily decreasing. In 1910 the total school population was 644,805, of which 265,767 were native whites of native parentage and 372,331 were negro.

According to an enumeration made in 1912 the total number of children of school age in that year was 740,856; of these 311,389 were native white and 429,467 were negro. In addition there were 407 Indian children of school age. There is no compulsory-education law.

The administration of the schools is in the hands of the State Board of Education, composed of the Secretary of State, the Attorney-General, and the Superintendent of Education. The latter is the chief executive officer. There is a superintendent for each county, and there are separate districts for white and for negro children. The districts have the power to tax themselves for the support of the schools. The common-school fund amounts to about \$3,500,000. For a long time the legislatures were somewhat indifferent to the importance of improvement in educational matters, but beginning with 1910 several laws of great importance have been passed. These included a measure permitting the consolidation of two or more weak schools into one stronger school; the establishment of agricultural high schools; the creation of a textbook commission and of a supervisor of elementary rural schools. The Legislature of 1911-12 enacted several important measures which have had good results.

There is a normal school at Hattiesburg, established in 1911. The Shelby Normal Institute at Shelby is for colored students. The institutions of collegiate rank include the University of Mississippi at University, the Mississippi Agricultural and Mechanical College at Agricultural College, Mississippi College at Clinton, Millsaps College and Meridian Male College at Meridian. Colleges for women are Hillman College at Clinton, Mississippi Industrial Institute and College at Columbus, Grenada College at Grenada, Meridian Women's College at Meridian, and the Port Gibson Female College at Port Gibson. Rust University at Holly Springs is for colored students. Other colleges for colored students are the Alcorn Agricultural and Mechanical College at Alcorn, the Southern Christian Institute at Edward, the Mississippi Industrial College at Holly Springs, Campbell College at Jackson, Jackson College at Jackson, Kosciusko Industrial College at Kosciusko, Lincoln School at Meridian, Tougaloo University at Tougaloo, Utica Normal Industrial Institute at Utica, Vicksburg Industrial School at Vicksburg, and Granada-Scion College at Winona. There are also several normal schools for colored persons.

Charities and Corrections. The charitable and correction institutions under the control of the State include the State Charity Hospital

at Jackson, the State Charitable Hospital at Vicksburg, the State Charitable Hospital at Natchez, the Beauvoir Home at Beauvoir, the State Insane Asylum at Asylum, the Eastern Mississippi Insane Asylum at Meridian, the State Penitentiary at Jackson, the Deaf and Dumb Institution and the Institution for the Blind at Jackson. State convicts are employed on several State farms and plantations, white and negro convicts being assigned to different farms. These farm penitentiaries are controlled by a board of trustees elected by the people. The hiring out of prisoners by counties is prohibited. Public farms must be secured for them to work on by the county authorities or they must be employed on the public roads.

Religion. Over half of the Church population of the State belong to the Baptist church, and the majority of the remainder to the Methodist. Of the lesser denominations the more important are the Presbyterian, Roman Catholic, Christian, and Protestant Episcopal.

History. In 1539 Hernando de Soto, with a band of Spanish adventurers, crossed the north-eastern part of what is now the State and in the early part of 1541 reached the Mississippi River, near the present site of Memphis, Tenn. In 1673 the French explorers Joliet and Marquette, passing down the Mississippi, sailed as far as the mouth of the Arkansas. In 1681-82 La Salle sailed down the river to its mouth and, taking formal possession for the King of France, Louis XIV, named the country Louisiana after him. The first attempt to found a colony was made in 1699 by Iberville, who brought 200 immigrants from France to Biloxi, on the east shore of the Bay of Biloxi. This was the germ of the subsequent settlement of New Orleans (1718). In 1716 Iberville and Bienville, with a large body of immigrants and a military force, ascended the Mississippi to the present site of Natchez, where they founded a settlement named Rosalie, in honor of the Countess of Pontchartrain. Attempts to plant colonies were soon after made at St. Peter's (on the Yazoo), at Pascagoula, and elsewhere. The small colonies in Mississippi, however, grew but slowly, New Orleans attracting many of the settlers. Under Bienville, who was Governor of Louisiana from 1718 to 1724, friendly relations with the Indians were preserved; but under his successor, Perriez, the hostility of the Natchez Indians was awakened. In 1729 a sudden assault was made on the line of French posts. At Fort Rosalie 200 persons were killed and more than 500 were taken prisoners. In the smaller settlements many of the inhabitants were butchered. Retribution followed swiftly. Aided by the Choctaw tribes, the French succeeded in defeating the Natchez, the greater part of whom fell in battle, while most of the survivors were sold as slaves. When Bienville became Governor again, in 1733, he found the colony at war with the Chickasaws, allies of the English, and the conflict continued for several years. There was a peace, followed in 1752 by another Indian war, instigated, it was said, by English adventurers. The French commander sought to retaliate, but without much success. Under French rule the country failed to prosper. In 1763 France ceded its possessions east of the Mississippi to Great Britain, which received also Florida from Spain. Immigrants flocked thither in considerable numbers from the English colonies on the Atlantic coast as well as from Scotland.

That part of the territory south of a line drawn through the mouth of the Yazoo River eastward to the Chattahoochee had been erected into the Province of West Florida soon after the establishment of English rule in 1763. In 1781 West Florida was conquered by Spain and passed under Spanish rule. By the Peace of Paris, in 1783, the thirty-first parallel of latitude was recognized as the southern boundary of the United States, and Spain was therefore considered as an intruder in that part of Mississippi to the north of the line. By the Treaty of 1795 between the United States and Spain, Spain ceded her claims to the disputed territory, but continued to occupy it until 1798. In 1798 the Territory of Mississippi was organized, and in 1804 it was extended to the present boundary of Tennessee. In 1813 the district south of 31° and east of the Pearl River, taken from Spain, was annexed. At first a Governor and three judges appointed by the President were the chief authorities for the government of the Territory, but in 1800 provision was made for a legislature, the Lower House consisting of nine members representing the three counties into which the Territory was then divided. In 1802 Washington became the capital of the Territory. In the Creek War Mississippi took a conspicuous part, several hundred inhabitants of the Territory being massacred at Fort Mims (q.v.). In the War of 1812 the Territory was well represented at the battle of New Orleans. In March, 1817, Congress passed an enabling Act for the admission of Mississippi to the Union, and the State was formally admitted Dec. 10, 1817. The most notable features of the first constitution of Mississippi were the high property qualifications for holding office, the short tenures of offices, and the large appointing power of the Governor and Legislature. The first Governor was David Holmes, and during his administration the capital was permanently located at Jackson, near the headwaters of the Pearl River.

By the treaties of 1830 and 1832, with the Choctaw and Chickasaw Indians, who inhabited all the northern part of the State, the lands occupied by those tribes were incorporated into the State, subjected to its jurisdiction, and thrown open to settlement by the whites. In 1832 a new constitution was adopted for the State. Its most notable features were the abolition of property qualifications for officeholding, the requirement that all officers, both State and county, including the judges, should be chosen by the people. It also created a high court of errors and appeals and abolished the office of Lieutenant Governor. During the "flush times" of this period Mississippi, like many other Southern and Western States, fell a victim to financial extravagance and speculation, one of the results of which was the repudiation by the State of \$5,000,000 in bonds which it had issued for the purpose of acquiring stock in the Union Bank. The supreme court of the State decided in favor of the liability of the State for the payment of the bonds, but the people, in an election in which this was the main issue, decided otherwise, and the Legislature refused to make any appropriation for the purpose. A little later \$2,000,000 of the Planters' Bank bonds were repudiated under similar circumstances. Upon the outbreak of the Mexican War Mississippi was called upon to furnish one regiment of volunteers, but more than enough men for two regiments responded. The first regiment was

commanded by Col. Jefferson Davis, who won great distinction at the battle of Buena Vista. In 1851 occurred the first important struggle in Mississippi over the slavery question, which had become serious on account of the enactment by Congress of the so-called Compromise Measures of 1850. The Democratic party in Mississippi adopted a platform favoring secession and nominated Jefferson Davis for Governor, while the Whigs declared their attachment to the Union and nominated United States Senator Foote as their standard bearer. The Union party won a substantial victory, and the slavery question rested until 1856, when the question of secession was again agitated on account of the fear that Fremont would be elected President. The news of John Brown's raid in 1859 led the Legislature to appropriate \$150,000 for the purchase of military supplies and for the organization of the militia. It was left, however, for the election of Lincoln to bring the secession movement to a head. An ordinance of secession was passed on Jan. 9, 1861, by a convention, by a vote of 84 to 15, and the State constitution was amended to bring it into conformity with the constitution of the Confederate States. During the Civil War the people of Mississippi suffered greatly, and in 1863 and 1864 especially a large part of the State was devastated by the contending armies. Almost all semblance of government had disappeared. (For the military operations in Mississippi, see CIVIL WAR; CORINTH; IUKA; VICKSBURG.) In June, 1865, Governor Clarke was removed, and a provisional Governor was appointed by President Johnson. On July 21 slavery was abolished by a State convention, and on the following day the ordinance of secession was repealed. In December the State government was given over into the hands of the duly elected officers, who proceeded to reorganize the State militia for the public defense, a course in which they were upheld by the President. Limited civil rights were conferred on the freedman, but the Fourteenth Amendment was rejected in January, 1867, and in March the State came under military government.

In January, 1868, a convention framed a new constitution, conferring the suffrage on negroes. The conservative element vehemently opposed the constitution because of the severe penalties it imposed on members of the government and armies of the Confederacy, and brought about its rejection at a popular election. Resubmitted in November, 1869, with the test oath and disfranchisement clauses to be voted on separately, the constitution was adopted almost unanimously, while the independent clauses were as unanimously rejected. In January, 1870, the Fourteenth and Fifteenth amendments were ratified, and on Feb. 17, 1870, the State was readmitted into the Union. The period before 1875 was marked by a spirit of bitter hatred between the old Democrats and the newly enfranchised negroes, together with their leaders, the white Republicans. The feeling of animosity was intensified by the unhappy financial condition of the State and by the dishonesty and incapacity of its officers, very many of whom were ignorant negroes, the tools of scheming politicians. Bloody collisions between whites and negroes were frequent in 1874 and 1875, in one of which, at Vicksburg, 29 negroes and several whites were killed. The desperate attempts of the "conservatives" to restore the supremacy of the white population proved finally successful

in 1875, when the Democratic party captured the Legislature. The Republican Governor and Lieutenant Governor and the Superintendent of Education were driven from office by impeachment or threats of impeachment, and since then the Democratic party has retained an overwhelming predominance. The 20 years after 1865 were a period of economic depression, the result of the havoc wrought by the war and of the difficulties encountered in readjusting production to the new conditions of labor, but later the rise of manufactures marked the beginning of a bright era. The racial problem assumed a momentous aspect in 1844, when a vast migration of colored men into the swamp lands of Mississippi seemed to threaten the rise of a negro State within the State of Mississippi. The policy of fortifying the white race in power was continued. By the constitution of 1890 the suffrage was restricted to those able to read a section of the Constitution or to interpret any passage if read aloud, a provision aimed against the negro voter and sufficiently successful in attaining its aim. (See *Government*, above.) In national elections Mississippi has been a Democratic State with the exception of the year 1840, when it voted for the Whig candidate, and of 1872, when its vote was given to Grant. In 1864 and 1868 its vote was not counted. While the Democratic party is practically the only political organization, there was from the first years of the twentieth century a condition of political turmoil which was hardly surpassed in other States where the great political parties have strong rival organizations. In 1904 James K. Vardaman was elected Governor. His chief political tenet was the disfranchisement of the negro, not only in the State but in the nation, by means of the repeal of the Fourteenth Amendment of the Constitution. During his term, 1907, it became necessary to elect a United States Senator for the term beginning March 4, 1911. In Mississippi the Senators take their seats four years after election. Governor Vardaman was a candidate for the Senate and was opposed by John Sharp Williams, then a Representative in Congress. The contest was one of great bitterness, and among its features was a series of joint debates between the two candidates. At the primary election held in August, 1907, Mr. Williams received a majority of about 1000 votes. On November 5 of that year E. F. Noel was elected Governor. The Legislature of 1908 passed a statutory prohibition bill which became operative on Jan. 1, 1909. An attempt made to pass a measure for constitutional prohibition was defeated. In the election for President in 1908 Bryan received 60,876 votes, Taft 4505, and Watson 1057. On Dec. 26, 1909, Senator A. J. McLaurin died, and Col. James Gordon, a Confederate veteran of the Civil War, was appointed by the Governor to fill the vacancy until a successor to Senator McLaurin could be chosen by the Legislature. This election by the Legislature in 1910 resulted in a fierce and prolonged factional battle. After the deadlock lasting seven weeks Le Roy T. Percy was elected. He was opposed by Mr. Vardaman, who, shortly after Senator Percy had taken his seat in the Senate, caused charges to be made that the latter's election had resulted from bribery and corruption. After an investigation Senator Percy was entirely exonerated. In 1911 another senatorial election was held for the term beginning March, 1913, when Senator Percy's

term expired. He was a candidate for reelection and was again opposed by Mr. Vardaman. In this election the latter was successful. Earl Brewer was chosen Governor. Mr. Vardaman was elected by the Legislature in 1912. On March 5 of that year the Legislature, which was controlled by friends of Mr. Vardaman, demanded the resignation of Senator Percy on the ground that he had promised to resign if he were defeated in the primaries for nomination, a procedure altogether unprecedented in the history of American politics. Senator Percy denied that such a pledge had been made and continued to serve out his term. In the presidential election of 1912 Wilson received 57,227 votes, Roosevelt 3645, Taft 1595, and Debs 2161. In 1912-13 the State suffered much from floods of the Mississippi River. In 1914 several amendments to the constitution were adopted. The number of supreme court judges was increased to six, and their term of office was made eight years. The Governors follow:

Cardle, *History of Mississippi* (ib., 1891); Duval, *History of Mississippi* (Louisville, Ky., 1892); Winsor, *The Mississippi Basin* (Boston, 1895); Muckenfuss, *History of Scientific Industries in Mississippi* (Jackson, 1900); Owen, "Bibliography of Mississippi," in *American Historical Association Report for 1899* (Washington, 1900); publications of Mississippi Historical Society (Oxford, 1900-14); Garner, *Reconstruction in Mississippi* (New York, 1901); Montgomery, *Reminiscences of Mississippi* (Cincinnati, 1901); Crider, "Geology and Mineral Resources of Mississippi," in *United States Geological Survey, Bulletin No. 283* (1906); Crider and Johnson, "Underground Water Resources of Mississippi," in *United States Geological Survey, Water Supply, Paper No. 159* (1906); Rowland, *Encyclopedia of Mississippi History* (Madison, Wis., 1908); Ellett, *Outline of Mississippi History* (Hattiesburg, 1913); reports of Department of Archives and History; annual and biennial reports of other State departments.

MISSISSIPPI, UNIVERSITY OF. A State university chartered in 1844 and opened in 1848, at Oxford, Miss., and maintained until 1880 by annual grants by the Legislature. From 1861 to 1865 exercises were suspended, owing to the resignation of the faculty. In 1870 the policy of separate schools, with optional studies and with courses leading to other degrees besides that of B.A., was adopted. There are seven undergraduate courses, partly elective, leading to the bachelor's degree in arts, science, pedagogy, philosophy, mining, and civil and electrical engineering. The university also maintains a law school, a medical department, and a summer school and confers the degrees of M.A. and Ph.D. In 1892 the preparatory education was discontinued at the university. The requirements for admission are those adopted by the Association of Colleges and Preparatory Schools of the Southern States, of which the university is one of the original members. Students from approved high schools are admitted without examination. Since 1882 women are admitted. The faculty consisted in 1915 of 35 instructors, and the students numbered 528. The library contained 25,000 volumes. The total endowment was about \$700,000, with a gross income of \$138,226. The buildings and grounds were valued at \$500,000, the total value of the property being \$1,300,000. The president in 1915 was Joseph N. Powers, LL.D.

MISSISSIPPI AGRICULTURAL AND MECHANICAL COLLEGE. An institution for agricultural and scientific education, established by an Act of the Legislature in 1878 at Agricultural College, Miss. The curriculum includes a two-year training course and four courses of instruction—agricultural, mechanical, industrial education, and general science—with provisions for graduate work and summer sessions. The degrees conferred are bachelor and master of science. There is also an honorary degree of master of progressive agriculture. The bona-fide residents of Mississippi receive free tuition; other students are required to pay a fee of \$50 per session. Instruction in military government is given by an officer of the United States army, and all students are required to wear a prescribed uniform within 5 miles of the college campus. During the regular sessions of the college the attendance of women is not permitted. The total enrollment in all depart-

ments in the session of 1914-15 was 1140. This does not include the Summer School. The faculty, teaching force, and officers of administration numbered 105. The value of the property at the end of the collegiate year 1913-14 was \$1,329,776; the income was \$537,580, of which \$246,008 was from State appropriations and \$60,817 from Federal appropriations. The library contains about 33,000 bound volumes and 65,000 unbound volumes. The president in 1915 was G. R. Hightower.

MISSISSIPPI BUBBLE. See MISSISSIPPI SCHEME.

MISSISSIPPIAN SERIES. A group of limestones outcropping in the upper Mississippi valley and also in Arkansas and Texas. It is the equivalent of the Lower Carboniferous in the Appalachian States. See CARBONIFEROUS SYSTEM.

MISSISSIPPI CATFISH. The largest of North American catfish (*Ameiurus lacustris*, or *Ictalurus ponderosus*), which may reach 150 pounds in weight, is sold in all the markets of its region and is regarded by many as good food. It inhabits the Great Lakes and all the larger waters of the Saskatchewan, Mississippi, and Missouri valleys. In color it is greenish slate, growing darker with age, the sides paler, without spots. (See CATFISH.) Among its many local names in the South are flannel mouth and mud cat.

MISSISSIPPI COLLEGE. An institution of learning at Clinton, Miss., founded in 1826. It has a preparatory and a collegiate department with an attendance in 1914 of 462 students and a faculty of 18 instructors. The library contained about 4000 volumes. The college buildings are valued at \$225,000, and the property of the institution at about \$700,000. The endowment is \$125,000, and the gross income \$25,000.

MISSISSIPPI RIVER (Algonquin, *Missi Sepe*, great river; lit., father of waters). The principal river of the North American continent, discovered by De Soto in 1541 (Map: United States, Eastern Part, H 4). In 1673 Marquette and Joliet descended it almost to its mouth, and in 1682 La Salle passed through it to the Gulf of Mexico and took possession of the country in the name of the King of France. Counting as a part of it the longest branch of the drainage system, the Missouri, which far overtops the central stem, it is the longest river in the world. The entire system lies within the United States, excepting the headwaters of a few tributaries of the upper Missouri, which extend a short distance beyond the northern boundary of Montana into Canada.

Location and Climate. The headwaters of the main north and south stem are in lat. 47° 09' N., long. 95° 13' W., and its central mouth in lat. 28° 59' N., long. 89° 08' W. Although well within the temperate zone, there is a wide range in climate, particularly in winter temperatures. In northern Minnesota the extreme range in temperature is from -50° F. to +100° F., while at New Orleans it varies from +20° F. to +100° F. These temperatures do not occur every year, but are likely to occur three years out of ten. The mean annual temperature at Duluth is 39° F.; at New Orleans, 69° F. The principal cities situated on the banks of the river are Minneapolis, St. Paul, La Crosse, Dubuque, Moline, Davenport, Rock Island, Burlington, Quincy, St. Louis, East St.

Louis, Cairo, Memphis, Vicksburg, Natchez, Baton Rouge, and New Orleans. The chief agricultural products in the north are wheat, barley, and potatoes; in the central States corn, oats, and rye; and in the south cotton, sugar cane, and tobacco. Fruits are grown throughout the valley, apples better in the north, and peaches more successfully in the south.

Source. Popularly Lake Itasca, since its discovery by Schoolcraft in 1832, has been considered the source of the Mississippi, and this is not far from being precise. Later explorers announced Nicollet Creek, Elk or Glazier Lake, Gagwa Dosh or Deer Creek, and Hernando de Soto Lake as the headwaters. According to an accurate contour map of Itasca State Park, issued by the Mississippi River Commission about 1910, Little Elk Lake is the ultimate source. It empties into Lake Itasca through Elk (or Excelsior) Creek and Elk Lake. Lake Itasca is surrounded by such an intricate network of smaller glacial lakes, more or less obscured by reeds and water grass, that it is easy to understand why this question was a matter of so much controversy until the whole Itasca basin was covered by a careful geodetic survey. Lake Itasca at its outlet is 2459 miles from the Gulf of Mexico, and Little Elk Lake about 7 miles farther. Lake Itasca is about 4 miles long, 30 feet deep, and about 1470 feet above sea level. Little Elk Lake is about half a mile long, 600 feet wide, and about 100 feet higher than Lake Itasca.

General Description. The Mississippi as it flows from the north end of Lake Itasca is ordinarily less than 20 feet wide and 2 feet deep. It flows swiftly over shoals and boulders in a northwesterly direction for a distance of 62 miles by river, or 32 along the axis of the valley, to Lac Travers or Lake Bemidji, covering about 20 square miles, surrounded by forested hills. The Mississippi as it flows from the east side of Lake Bemidji is at the most northern point of its course. Seventeen miles farther on it enters Cass Lake, and 12 miles beyond Cass Lake it enters Lake Winnibigoshish. From Lake Winnibigoshish the river flows southeastward for 24 miles and unites with Leech Lake River, which is nearly as large as the Mississippi and furnishes the outlet for Leech Lake, which covers about 250 square miles and is the largest of the lakes constituting the headwaters of the Mississippi. Forty miles farther is found the first rock in place, a bed of sandstone, where the Falls of Pokegama have been submerged by two dams. Eighty miles below Pokegama the waters of Sandy Lake empty into the Mississippi through a storage dam, and 82 miles below Sandy Lake enters Pine River, which is dammed a short distance above its mouth to regulate the outflow from Whitefish Lake. Twenty-two miles below Pine River is located the town of Brainerd (q.v.), with a water-power dam with a 15-foot head. Between Brainerd and Minneapolis occurs a series of dams and rapids having a total fall, with the Brainerd Dam, of 444 feet. The Crow Wing River, which is nearly as large as the Mississippi, enters 11 miles below Brainerd. At the Sauk Rapids, 60 miles below the Crow Wing and at the entrance of Sauk River, begin the first rocky banks of Potsdam sandstone, which are in frequent evidence from this point down to the head of the Rock Island Rapids, 350 miles below St. Paul.

The entire drainage basin of the Mississippi

above Minneapolis is covered with a blanket of glacial drift, 100 to 300 feet thick, consisting of a mixture of clay and gravel. Its surface is very irregular and is broken by thousands of glacial pot holes, resulting in a vast multitude of lakes and swamps, estimated by some at 5000 to 6000 in number. At the Falls of St. Anthony, in Minneapolis, the river pitches down a vertical falls and rapids amounting to 80 feet in half a mile, leaving the clay banks for a channel that lies between vertical bluffs of sandstone, gradually increasing to a height of 300 to 500 feet as the bed sinks below the general level of the prairie. Below St. Paul the distance between the bluffs rapidly increases, so that from St. Paul to Rock Island the usual distance between bluffs is 2 to 3 miles, except at the head of the Rock Island Rapids, where they are only 1 mile apart. Their height varies from 200 to 600 feet. The debris from centuries of degradation has built up slopes at the foot of the bluffs and on all projecting ledges which are now covered with grass and trees. For more than 200 miles below St. Paul the oaks, elms, beeches, and maples are interspersed with cedars and pines. This fact, together with the greater height of the bluffs, makes this section even more beautiful than the bluffs farther south. The river flows first against one bluff and then the other in its meanderings back and forth across the valley.

Seventy-seven miles below St. Paul the vast quantities of sand brought down by the Chippewa River have choked the valley so that the river fills the entire space from bluff to bluff, forming Lake Pepin, which is approximately 25 miles long and 2 to 3 miles wide. At the Rock Island Rapids the bed of the river consists of stratified limestone in a series of folds or steps, creating 11 chains or rapids with a total fall of 21 feet in 15 miles. From this point down to Cape Girardeau, 132 miles below St. Louis and 460 miles from Rock Island, the formation is Carboniferous and the river winds back and forth between picturesque rocky bluffs 100 to 400 feet high and from 3 to 8 miles apart. The bluffs are usually partially covered with grass and trees, as above Rock Island; but from Grafton to Alton, a distance of 18 miles, and for shorter distances below St. Louis, the bluffs rise vertically from the river, forming palisades of rugged beauty. From Cape Girardeau down to Grays Point, a distance of 5 miles, the river passes the low land which constitutes the head of the St. Francis basin, through which the flood waters of the Mississippi formerly escaped in great volumes. From Grays Point to Commerce, a distance of 7 miles, the river flows through a gorge, where the water is closely confined between vertical bluffs one-half to three-fourths of a mile apart. This geological landmark is said to be a spur of the Ozark Mountains, which cross the southern part of Missouri.

The rock bluffs between which the river meanders for more than 1000 miles and the vast northern upland, mainly elevated rock with a moderate covering of soil, both terminate at Commerce, 144 miles below St. Louis and 38 miles above the mouth of the Ohio. The vast alluvial valley of great fertility extending from Commerce to the Gulf, about 1100 miles by river or 600 miles in a direct line, has been created from the river's own silt. Commerce is at the head of an ancient arm of the ocean into

which the silt-laden river poured its deposits as the present river does into the Gulf, leaving a valley as fertile as that of the Nile in its palmiest days and four times as large.

From Cairo to the Gulf the surface of the river is normally above the lands lying back from the river. The ground slopes away from the river with a gradient of about 7 feet in the first mile, decreasing gradually to 6 inches per mile at the outer edge, where the overflow from the Mississippi naturally drained away towards the Gulf through numerous bayous running parallel to the main river.

Between Cairo and Memphis, 230 miles, the river does not get far from the low bluffs on the east side of the valley and at several points impinges upon them. The river then zigzags diagonally across the wide valley and strikes the west bluff at Helena, 306 miles below Cairo. The St. Francis basin, which is 45 miles wide just below Cairo and 35 miles wide at Memphis, tapers out at Helena, where the St. Francis empties into the Mississippi. The Yazoo basin, which starts at Memphis on the east side of the river, increases in width as the St. Francis decreases, having a width of 22 miles at Helena and 60 miles opposite the mouth of the Arkansas River, which is 402 miles below Cairo. At Arkansas City, 438 miles below Cairo, the Yazoo basin reaches its maximum width, 65 miles, and the Tensas basin begins on the west bank. The Yazoo basin terminates in a wedge at Vicksburg, 600 miles below Cairo, where the Yazoo enters the Mississippi, and the latter again strikes the east bluffs, which at this point are about 200 feet high. The Tensas basin, which is from 20 to 35 miles in width, terminates at the mouth of the Red, of which the Tensas is a tributary. There is no diminution in the width of the basin, however, only a change in the name, which from this point to the Gulf is known as the Atchafalaya basin, after the Atchafalaya River, which not only carries the discharge of the Red River, but also at flood times an immense volume from the Mississippi. A narrower basin on the New Orleans side is known as the Pontchartrain basin.

Islands, Lakes, and Tributaries. Between St. Paul and the mouth of the Missouri, 658 miles, there are about 540 islands of sufficient size to be dignified with a name or number. They occur singly, in pairs, and in chains, the lower ones covered with willows, and the higher ones with cottonwoods, maples, and oaks or else cleared for cultivation. Between the mouth of the Missouri and the Ohio there are, or were, about 60 islands large enough to be designated by name. Most of them are from 2 to 3 miles long. Nearly all of these 600 islands have been connected with the mainland by wing dams or hurdles, and the channels or chutes behind them have become silted up, so that they no longer appear as islands during low water. This is particularly true below St. Louis, where most of the islands have already lost their identity except to those familiar with the river. Between Cairo and the mouth of Red River, a distance of 765 miles, there are 147 islands, usually 2 to 4 miles in length. From this point to the Gulf, 309 miles, there are only three islands, and except at these points the river sweeps along majestically in a single deep channel.

A great number of large horseshoe lakes lie adjacent to the river, particularly from Mem-

phis to the mouth of Red River, where, in a distance of 534 miles, there are 31 of these crescent-shaped lakes, most of them from 5 to 10 miles long. These are former channels of the river which were abandoned as the result of cut-offs, described in a later paragraph. The number of tributaries, and tributaries of tributaries, which are shown in ordinary atlases aggregates about 250, of which more than 50 are navigable. The more important of the tributaries in the order of their entry, proceeding downstream from Minneapolis, are the Minnesota, St. Croix, Chippewa, Black, Wisconsin, Galena, Rock, Iowa, Des Moines, Salt, Illinois, Missouri, Kaskaskia, Ohio, St. Francis, Arkansas, Yazoo, Big Black, and Red.

Floods. The Mississippi valley receives little rain from either the Atlantic or the Pacific coast. A small percentage comes from the Great Lakes, but the heavy rains which produce great floods come from the Gulf of Mexico. In winter and spring the surface of the ground is cooler than the waters of the Gulf, and as the moisture-laden winds sweep northward they become cooled and create snow and rain. A wind from the southwest will sweep across the Ohio valley; one from the south up the Mississippi; one from the southeast across the valleys of the Red, the Arkansas, and the Missouri; but in all cases the greatest rainfall will occur near the Gulf and gradually decrease as the winds travel inland. Floods do not arise from mean conditions, but from heavy rainfalls of long duration; if the ground is frozen or saturated, the run-off is proportionately greater. The maximum discharge of the upper Mississippi is 450,000 cubic feet per second; the Missouri, on account of its great length, 900,000; the Ohio, 1,400,000; the Arkansas, 450,000; and the Red, 220,000. There is also a large discharge from the St. Francis, Yazoo, White, and Tensas. Below Cairo the river overflows its banks when the discharge exceeds 1,000,000 cubic feet per second. The flood of 1912 was the greatest below Cairo of which we have definite knowledge and amounted to about 2,000,000 cubic feet per second at Cairo and 2,300,000 flowing into the Gulf. This flood was due to the coincidence of moderately high floods from the Missouri, upper Mississippi, Ohio, Wabash, Tennessee, and Cumberland rivers, supplemented by excessive rains covering the alluvial valley and the watersheds of the southern tributaries.

The alluvial valley having been built up by floods, it follows that they must have always occurred. Naturally only the more disastrous floods are remembered and recorded, and the older ones are gradually forgotten as those of more recent date attract the attention. The floods of 1785, 1828, and 1844 were of abnormal height and did great damage, and stirred the people in the valley to renewed efforts at levee construction. Then came the great floods of 1851 and 1858. The latter was regarded as the greatest which had ever come down the river and overtopped practically all of the levees in existence at that time. Active repair work and extensions were followed by other great floods in 1862, 1865, and 1867, which supplemented the havoc of the war and did millions of dollars' worth of damage. Active reconstruction was followed by the great flood of 1874, which in many parts of the valley proved to be the most disastrous of all. Then in 1882, 1883, and 1884 the valley was visited for the first time by three

excessive floods in three successive years. In 1882 there were 284 crevasses; in 1883, 224; in 1884, 204; 712 crevasses in three years! A large part of the lands reverted to the States on account of the inability of the owners to pay the heavy levee taxes, and in 1882 the Federal government came to the rescue and began its coöperation with State and local organizations, as stated in the section on *Levees*. The greatest activity ever witnessed on the levees followed, and the results were most encouraging.

Floods of greater volume than that of 1874 also occurred in 1886, 1887, 1892, and 1893, but, on account of the greatly improved levee system, these were all safely passed without material damage except that due to erosion. But in 1897 came another of unusual severity, causing 47 crevasses and flooding 20,000 square miles. This was followed by even greater activity in levee construction, and after the flood of the following year the Mississippi River Commission reported: "This is the first time in the history of the river since the commencement of the continuous levee system that a flood reaching the height of 49.8 feet on the gauge at Cairo has been carried to the Gulf without a single break in the levee." For five years the levees successfully held back the floods, but in 1903 another great flood came, and the levees were again breached, doing enormous damage. In 1907 the flood was only a trifle lower than that of 1903. The next year was remarkable for four moderate floods in succession, beginning in February and ending in June, followed by another in 1909. The latter was about as large as that of 1874, but all were carried through to the Gulf without any break in the levees.

In 1912 came the greatest flood on record (as measured by the volume of water) causing 14 crevasses below Cairo and a loss in property estimated at \$42,000,000. There was some loss of human life, but the number of lives lost was never ascertained. The army officers reported that 272,000 people were furnished food and shelter.

In 1913 two distinct and excessive floods passed Cairo, the first in January and the second in April. The second exceeded in height all previous records for nearly the entire distance from Cairo to the Gulf. Like that of the preceding year it was caused by excessive rains throughout the valley. The precipitation at a number of Weather Bureau stations in Ohio exceeded all previous records for a like period of time. At Cincinnati the Ohio rose 21 feet in one day. The flood of January was kept within the levees except at Beulah, where a break of the previous year had not yet been completely closed. This crevasse attained a width of 1000 feet and overflowed about 2100 square miles. During February and March it was closed successfully at great cost by means of a trestle, using 1374 cars of rock and 145,000 cubic yards of earth. During the April flood six crevasses occurred, overflowing 2568 square miles, but in addition 6756 square miles were overflowed by water coming through various un-leveed sections.

An important contributory cause of repeated failures after so many years of levee building is the fact that, as the areas formerly subject to overflow are more and more protected from overflow, the channel left for the flood waters has become more and more restricted and the water

surface has steadily risen. The former flood width of 20 to 80 miles by 1915 had been reduced to about 5 miles and the flood height increased about 10 feet. This was anticipated and correctly computed 20 years previously, but the funds available were not sufficient to enlarge the levees to the full cross section required. The waters of the upper Mississippi, Missouri, and Ohio having been combined at Cairo, the gauge at that point is an accurate index of the relative volumes of different years, particularly since it is not so much affected by breaks or extensions in the levee system as the gauges farther down. However, two floods passing Cairo at the same stage do not always remain of the same proportions throughout the lower valley, as they are affected to some extent by the discharge from the tributaries below Cairo.

FLOOD HEIGHTS ON THE CAIRO GAUGE*

Year	Day	Feet
1858	June 21	49.53
1859	May 7	46.49
1862	May 2	50.76
1865	March 19	47.90
1867	March 21	50.97
1874	April 26	47.37
1876	April 6	46.38
1882	February 26	51.87
1883	February 27	52.17
1884	February 22	51.79
1886	April 19	51.02
1887	March 9	48.50
1892	April 28	48.29
1893	May 9	49.33
1897	March 25	51.72
1898	April 6	49.78
1899	April 2	46.24
1903	March 16	50.57
1904	April 5	49.10
1906	April 9	46.90
1907	January 27	50.33
1908	March 19	45.55
1909	March 16	47.27
1912	April 6	53.94
1913	January 28	48.89
1913	April 7	54.69

*Extreme low water is -1.0.

Watershed. The area drained by the Mississippi River and its tributaries extends from the Alleghany Mountains to the Rocky Mountains and from the St. Lawrence basin to the Gulf of Mexico—1,240,050 square miles, or 41 per cent of the mainland of the United States, exclusive of Alaska. The areas of the principal river basins which form this immense watershed are as follows:

DESIGNATION	Area, sq. miles	Percentage of whole
Missouri	527,150	43
Upper Mississippi	165,900	13
Ohio	201,700	16
Middle and lower Mississippi	69,000	6
Arkansas	186,300	15
Red	90,000	7
Total	1,240,051	100

Divisions and Length. For purposes of investigation and improvement the Mississippi River is divided by the government engineers as shown in the districts tabulated on page 13. These distances are measured along a line midway between the banks. Distances measured along the steamboat channel are more than 10 per cent greater. In volume of sediment and

other characteristics the Missouri River is the main stream and should have been named the Mississippi. Measuring from the headwaters of the Missouri River to the Gulf, it has a total length of 4200 miles, the longest river in the world.

Slopes, Water Power, Locks, and Dams. From Lake Itasca, which is 1472 feet above sea level, to Bemidji there is a fall of 130 feet in 32 miles. At Bemidji there is a power dam with a head of 22 feet. From this point to Brainerd, a distance of 300 miles, the river flows through

DISTRICT	Length miles
Little Elk Lake to St. Paul.....	534
St. Paul to mouth of Missouri River (upper Mississippi).....	658
Mouth of Missouri River to mouth of Ohio River (middle Mississippi).....	200
Mouth of Ohio River to head of passes (lower Mississippi).....	1,060
South Pass.....	14
Total.....	2,466

Reservoirs and Capacities. Near the headwaters of the Mississippi a series of lakes have been dammed by the government in order to create a system of storage reservoirs for increasing the low-water flow and depth of navigable channel of the upper river. The capacities of these reservoirs are given in the accompanying table; together they constitute the largest reservoir system in the world.

NAME	Storage capacity, cu. ft.
Lake Winnibigoshish and Cass Lake.....	43,992,000,000
Leech Lake.....	33,094,300,000
Pokegama Lake.....	5,260,000,000
Sandy Lake.....	3,157,900,000
Pine River.....	7,732,900,000
Gull Lake.....	4,910,100,000

Widths, Natural and Artificial. From Lake Itasca to Minneapolis the width of the river increases gradually from less than 50 to more than 400 feet at ordinary stages. Under the adopted project for the deepening of the river the low-water width is contracted to 300 feet at St. Paul. As the volume is increased by various tributaries this width is increased by degrees to 600, 700, 900, 1000, 1200, and 1400 feet, the latter width being for the reach between the mouths of the Illinois and Missouri. On the Rock Island Rapids the width between contraction works is 250 to 400 feet. Where the Des Moines Rapids formerly existed there is now a beautiful artificial lake about a mile wide and 50 to 60 miles long, created by the new concrete power dam at Keokuk. The natural width from St. Paul to the mouth of the Missouri is from two to three times these project widths, except in Lake Pepin, where the natural width of 2 miles has not been disturbed.

From the mouth of the Missouri to the mouth of the Ohio the project width is 2500 feet, although the widths in the unimproved sections vary from 800 to 5000 feet. The widths in this reach at a bank-full stage vary from 1600 to 7000 feet. The flood width, before the construction of levees, extended from bluff to bluff, an average distance of 5 miles.

Below Cairo the project width is 3000 feet, the natural low-water width 1000 to 7500 feet, and the bank-full width 2000 to 10,500 feet. Previous to the construction of levees the area subject to overflow had an average width of 40 miles. In 1915 the average restricted flood width was 5 to 10 miles, decreasing to about 1 mile below Baton Rouge.

a country which is largely swampy, but the flat slopes of the river are interrupted by the storage dams at Lake Winnibigoshish and Pokegama Lake, by a power dam at Grand Rapids, and by several smaller rapids farther downstream. The crest of the Brainerd power dam is 1172 feet above sea level. From this point to Minneapolis, a distance of 150 miles, there is a fall of 444 feet, 80 of which is in the falls and rapids of St. Anthony. About 135 feet of this 444 is utilized by six power dams; the remainder is wasted.

Between Minneapolis and St. Paul the United States government in 1915 completed a large lock and power dam, with a lift of 30 feet, which permits the packets from St. Louis to reach Minneapolis. From this point to Le Claire, at the head of the Rock Island Rapids, the average slope is about 0.4 foot per mile, except in Lake Pepin, where the river has a fall of less than 0.2 foot in 24 miles. At the Rock Island Rapids there is a fall of 21 feet in 15 miles. From this point to the head of Cooper Lake at Burlington, a distance of 84 miles, there is an average slope of 0.35 foot per mile.

Cooper Lake, named after the civil engineer who designed and built the hydroelectric power plant at Keokuk, is 50 to 60 miles long and nearly level. The head on the dam and the lift in the new government lock will vary from 30 to 40 feet, according to the amount of water stored in the pool. From Keokuk to Grafton, at the mouth of the Illinois River, a distance of 150 miles, there is a slope of 0.5 foot per mile; from Grafton to the Eads Bridge at St. Louis, 0.66 per mile, although the maximum at the Chain of Rocks above St. Louis is 1.3 and the minimum, in the St. Louis harbor, 0.2 per mile. Low water at this point is 378 feet above Gulf level.

From the Eads Bridge to Cairo the average slope is 0.6 foot per mile; from Cairo to Vicksburg, 600 miles by river, 0.38 per mile; from Vicksburg to the mouth of Red River, 154 miles, 0.24 per mile. This point is over 300 miles from the Gulf and only 3 feet above Gulf level. Practically all of this head is used up in the next 70 miles, so that at Baton Rouge, 240 miles from the Gulf, low water is only 0.2 foot above mean Gulf level. Although the tides at the mouth of the river amount to only 1 to 2 feet, their effect extends up the river to Baton Rouge, and below this point there is a slight negative slope during high tide. In other words, contrary to popular opinion, water does run "up hill" under certain conditions.

Depths, Prior and Subsequent to Improvement. Between St. Paul and St. Louis, prior

to improvement, the depths on the bars or crossings at low water did not exceed 2 to 2.5 feet, especially in the upper sections and on the Rock Island and Des Moines Rapids. About two-thirds of this division has now been improved to a low-water depth of 6 feet. Where the improvements have not been completed, depths of not less than 4 feet are maintained by dredging. From St. Louis to Cairo the minimum depths, previous to improvement, did not exceed 3.5 to 4 feet at low water. At present, by means of improvement works and dredging, a depth of 8

above St. Louis are all frozen over, the discharge at and above St. Louis may be 25 per cent less than is shown in the table. Since the opening of the Chicago Drainage Canal in January, 1900, about 5000 cubic feet per second have been taken from Lake Michigan through the Chicago River, the Chicago Drainage Canal, the Des Plaines and Illinois rivers and discharged into the Mississippi at Grafton. At and below Grafton, therefore, the present low-water discharge is 5000 cubic feet per second greater than the natural discharge shown in the table.

NATURAL DISCHARGE OF MISSISSIPPI RIVER

NAME OF STATION	Distance from Gulf, miles	Ordinary low-water discharge, cubic feet per second	Maximum flood discharge, cubic feet per second
Above Cass Lake.....	2,370	100	2,000
Grand Rapids, Minn.....	2,278	500	10,000
Brainerd, Minn.....	2,107	1,500	40,000

Mississippi + Atchafalaya + crevasses.....		100,000	2,300,000

feet is maintained. From Cairo to the Gulf the minimum depths, prior to improvement, did not exceed 4.5 to 6 feet at low water. At the present time, by means of improvement works and dredging, primarily the latter, a minimum depth of 9 feet is maintained from Cairo to Vicksburg. Below Vicksburg no dredging is required, the least depths being 11 feet from Vicksburg to Baton Rouge, 35 feet from Baton Rouge to New Orleans, 62 feet from New Orleans to Quarantine Station, and 30 feet to the Gulf through either the South Pass or the Southwest Pass.

Velocity of Current. The velocity of the current is a function of the depth as well as of the slope. It varies greatly, therefore, between low and high water at every point on the river. The velocity at low water, however, does not differ greatly on the upper and lower river, as the greater depths on the lower river are largely counterbalanced by the flatter slopes. Roughly speaking, the velocity at low water, from St. Paul to St. Louis, except on the rapids, varies from 1 to 2 feet per second, and from St. Louis to New Orleans from 1 to 2.5 feet, while the high-water velocities vary from 3 to 6 feet on the upper river and from 6 to 8 feet on the lower river. The greatest velocity that has been noted on the river occurred under the Merchants Bridge at St. Louis during the flood of 1892, when a mean velocity of 12.2 feet per second was measured. The excessive contraction of the waterway under the bridge caused the bottom to scour out to a depth of 86 feet on this occasion. To obtain the velocities in miles per hour multiply the preceding figures by 0.7.

Discharge. The ordinary or normal low-water discharge and the maximum flood discharge of the river at typical points are shown in the accompanying table. By ordinary or normal low water is meant the lowest stage which occurs during the navigation season. Occasionally in midwinter, when the tributaries

These low-water discharges do not occur every summer, but only once in five to ten years. The low-water discharge shown for St. Louis corresponds to a zero stage on the St. Louis gauge, while "standard low water," which is approximately the average annual low water during the navigation season, corresponds to a discharge of 63,000 cubic feet per second.

Just above Red River Landing is the mouth of the Red River, which also serves as the mouth, or rather as the headwaters, of the Atchafalaya River, because ordinarily the latter takes all of the discharge from the Red River and also some from the Mississippi River, as indicated in the table. The reduction in flood discharge below Helena is due to crevasses or breaks in the levees, as described further on under LEVEES.

Caving Banks. In the volume of its caving banks the Mississippi probably surpasses every other river that man has yet attempted to improve. In the superficial area of its caving banks it is exceeded by the Missouri, but on account of the higher banks and greater depths of water on the Mississippi the volume of earth falling into the river is greater along the latter. Previous to revetment some caving occurred on the upper Mississippi as far north as Keokuk, but caving on a large scale really begins at the mouth of the Missouri River and increases in extent downstream, reaching a maximum in the vicinity of Vicksburg. Below the mouth of Red River the caving gradually diminishes until at Donaldsonville it practically ceases.

From Cairo to Red River the extent of the caving banks was measured in 1907 and 1908, and it was found that 411 miles of bank were caving at low water and 708 miles at high water, or, deducting for the banks which were caving at both low and high water, a total of 749 miles in 754 miles of river. In other words, caving is taking place on one bank or the other or on some island practically the entire distance. A

similar survey in 1892, before much revetment work had been done, showed 921 miles of caving banks in the 885 miles from Cairo to Donaldsonville. The same survey showed that the average annual caving in this distance amounted to 38,991,000 square yards, or 12.6 square miles in area by 66 feet in depth, or more than 1,000,000 cubic yards per mile of river. Similar measurements between Cairo and St. Louis show that from 1879 to 1889 the average annual amount of caving was 64,000,000 cubic yards, while from 1889 to 1907 the average annual amount was 48,000,000, the diminution being due to the extensive revetment work executed in the meantime.

Caving banks have been classified as eroding banks, slumping banks, sinking banks, and sliding or slipping banks. As most of the damage is done by the first method, no further reference will be made to the others. A typical eroding bank is one whose soil is not cohesive enough to withstand the scouring and dissolving action of the ordinary river currents. As the velocity of the current increases with the stage, the erosion increases correspondingly, provided the direction of the current remains the same. As the direction of the current is frequently different at high water, caving, while much more extensive, does not always occur at the same places. In erosion the bank is undercut or undermined below the water surface until the weight of the portion above the water causes it to break away and fall into the river. A recession in the shore line of 300 to 600 feet in a single season is a common occurrence.

Sinuosities. Experiments on a large scale show that a running stream in an alluvial bed will not remain straight. Owing to variations in the cohesive strength of the soil, irregularities begin to develop, and the resulting curves are gradually enlarged by the centrifugal action of the currents thereby inaugurated. The resulting radius of curvature is determined largely by the volume of discharge. For example, below St. Paul the radius of curvature is 1600 to 4500 feet, while in the bends below Arkansas City it is from 8000 to 15,000 feet. When the river changes from its low-water flow to a flood discharge, it attempts to adjust its sinuosities to its increased flow. In other words, at a flood stage the current does not follow the deep bends in which it flowed during low water, but tends to flow in flatter curves, thereby shortening and changing its main channel to the confusion of the navigator.

The greatest danger to the regimen of a river occurs, however, when the erosion in one bend approaches the cutting bank in the second bend below. If left to itself, the peninsula or narrow neck of land will be eventually cut through, thereby forming a cut-off. As this disturbs the regimen of the river for many miles above and below, it is always prevented by bank revetment. If not prevented, it may require 20 to 25 years before this reach becomes as stable as it was before the cut-off took place. The last cut-off occurred in 1884, before improvement work was well organized, at Waterproof, 20 miles above Natchez, shortening the river about 12 miles.

Erosion in the bends does not widen the river because the convex bank is built out as rapidly as the other caves away, but it takes many years before the new accretion becomes high enough and fertile enough to be valuable for agricultural purposes.

The Movement of Sediment. Material is carried down the river in three ways, viz., in solution, in suspension, and by rolling along the bottom. The second is by far the greatest in volume. The material carried in suspension by the Mississippi is received almost entirely from the Missouri River. At low water the proportion of sediment in the Missouri River is about 1 part in 1000, by weight, while at a flood stage it amounts to 10 parts in 1000, or 1 per cent of the weight of water. This means that a flood of 500,000 cubic feet per second carries with it into the Mississippi about 120 cubic yards of sediment per second, or more than 10,000,000 cubic yards per day. It is estimated that 400,000,000 cubic yards per annum are carried into the Mississippi from the Missouri, and approximately the same amount passes out into the Gulf. A volume, therefore, equal to that produced by the river's own caving banks is deposited as accretions along the banks of the river and on the areas subject to overflow. A deposit or accretion occurs whenever the velocity of the current is checked, as, e.g., below a hurdle or permeable dike, where the fill frequently amounts to 10 feet during a single flood. One case is on record of a maximum deposit of 64 feet in a single year.

The movement of sand along the river bottom results in the formation of sand waves, a phenomenon similar to the formation and movement of sand dunes or snowdrifts by the wind. Sand waves on the lower river vary from 400 to 1000 feet in length, from 8 to 22 feet in height, and have a daily movement of 20 to 40 feet. They have the least dimensions and slowest rate of travel during low water and the greatest during high water.

Bars and Crossings. Concurrently with the erosion and accretion in each bend occurs another process which is equally typical of all alluvial streams, viz., the formation of a bar or submerged dam across the channel at the lower end of each bend. These do not lie normal to the banks, but extend diagonally across the river, having a length at least double the width of the river. In this way the deep water in the upper pool usually extends downstream past the head of the next pool, and the main body of water, in passing from one pool into the next, passes over this bar or natural weir in a comparatively thin sheet of water. The deepest water in a bend is always found near the concave bank, and the pilot of a vessel, in passing from the deep water in one pool to the deep water in the pool below, must make a crossing in a diagonal course from one side of the river to the other.

One of the most interesting characteristics of these bars, and a most troublesome one to the navigator, is the fact that the top or crest rises and falls with the water surface. Repeated measurements show that below St. Louis the available depth across a bar increases only about one-half foot for every foot rise in the water surface.

After a high stage, if the river falls slowly, say 0.2 or 0.3 foot per day, the current will have time to cut down the bars fast enough to maintain a good channel; but if the river falls rapidly, the result is most disastrous, as there will be bad water on the crossings until the current has time to cut them down or the hydraulic dredges to dredge a channel through them. For the guidance of the pilots the cross-

ings are indicated by lights and day marks maintained by the Lighthouse Service.

Bank Revetment. When the permanent improvement or regulation of a river like the Mississippi is undertaken, the first work necessary is the revetment or protection of its caving banks, giving the channel a fixed location and incidentally conserving the fertile bottom lands along the river and reducing the amount of sediment to be disposed of by the stream. This can be accomplished the most economically by the use of brush and stone revetment, constructed during the low-water season. Below the water the sloping bank is covered with a mattress or carpet of willow brush, covered with a single layer of rubble stone, while above the water level, where the willows would soon rot, stone alone is used in a heavier layer. The width of the mattress varies with the depth of the river and the friability of the soil. On the upper river the width varies from 25 to 35 feet; between St. Louis and Cairo the standard width is 125 feet; and below Cairo, 250 to 400 feet. On the upper and lower river the mattress is made up of fascines, or bundles of willows, fastened together with poles and wire cables, while on the middle Mississippi the mattress is made by weaving light willows under and over heavier poles, placed about 6 feet apart, parallel to the bank. The willows are 20 to 30 feet long and from 2 to 4 inches thick at the butt, except the poles, which are longer and heavier. The mattresses are made on skids supported on barges, the barges being gradually withdrawn downstream as the mattress is formed, leaving a continuous floating mattress, which is then sunk from the upstream end by loading it with stone.

Above the water level the bank is first graded by a hydraulic grader to a slope of 1, vertical, to 2.5 or 3, horizontal, and covered with rubble stone placed by hand. Where stone must be transported long distances, as on the lower Mississippi, it has been found more economical to use concrete, provided gravel may be found within a reasonable distance. The height of the banks above standard low water varies from 10 to 20 feet on the upper river, from 20 to 30 feet on the middle Mississippi, and from 40 to 60 feet on the lower river.

Contraction Works. As indicated by the name, these are built for the purpose of contracting the cross section of the river where its natural width, at low water, is too great and its depth too shallow to afford a good navigable channel. The widths to which the river is being contracted are given in the section on *Widths, Natural and Artificial*. The contraction of the entire flow within a restricted width results in scouring out the bottom to the required depth. On the upper river, where these works are called wing dams, they are built up of alternate layers of brush and stone—about two-thirds brush and one-third stone—to a height of 6 feet above mean low water. The first or lowest course projects downstream about 10 feet beyond the others so as to protect the dam from underscour.

On the middle Mississippi the contraction works consist of permeable pile dikes, locally called hurdles, the piles being driven through a brush mattress having a width of 60 to 100 feet to protect it from underscour. The piles are driven in clusters of three to four each, and each hurdle consists of two to three rows of clusters. The rows are about 3 feet apart, and the

clusters 8 to 10 feet apart in the rows and staggered with those in adjoining rows. Long slender piles are then laid horizontally between rows, thereby bracing the upper row against the adjoining row. The tops of the piles are left 15 to 20 feet above low water at the channel end and 20 to 25 feet at the bank end. The piles vary from 30 to 60 feet in length, according to the depth of the water, and have a penetration of about one-third their length. On the lower river no contraction works are being built as the funds appropriated are needed more urgently for levees, bank revetment, and dredging.

Dredging and Snagging. Dredging is carried on extensively to maintain the project depth where improvement works have not yet been constructed and to supplement the scouring action of the contraction works when the river falls rapidly after a high stage. Most of this work is done by hydraulic or suction dredges, of which in 1915 there were eight on the upper river, four on the middle division, and nine on the lower river. The size of the discharge pipe is 12 to 18 inches in diameter, 28 to 32 inches, and 32 to 36 inches respectively on the three divisions of the river. The largest suction dredges have a capacity of 1000 to 2000 cubic yards of sand per hour, and the cost varies from five to ten cents per cubic yard. In addition to the suction dredges, seven dipper dredges are in use on the upper Mississippi excavating rock and other hard material, principally on the Rock Island Rapids. See DREDGE.

One snagboat above and two below the mouth of the Missouri patrol the river during the navigation season to remove snags and other obstructions which are a menace to navigation. To dispose of a snag it is hoisted on deck with machinery, the portions which will float away are sawed off in short lengths, and the heavy mass of roots is dropped in a deep pool, deposited below a wing dam, or hauled out on the bank.

Levees. The main area originally subject to overflow, amounting to 29,790 square miles, begins at Cairo on the left bank and at Cape Girardeau, 51 miles above Cairo, on the right bank. The entire levee system includes about 1570 miles of levee, of which all but 70 miles were under construction in 1915, affording protection during moderate floods to 26,570 square miles. Between Cape Girardeau and Rock Island there are additional levee lines aggregating 337 miles in length, but the area protected probably does not exceed 1000 square miles. The following remarks refer to the main area below Cairo.

The first levee was built at New Orleans about the beginning of the eighteenth century. In 1828 the State of Louisiana took up the matter quite actively and up to the time of the Civil War had expended about \$18,000,000, while Mississippi was a close second with \$14,000,000. The total expenditure by individuals, parishes, and States up to that time is estimated by C. G. Forshey, of New Orleans, at over \$41,000,000. During the war and the years immediately following many breaks occurred, many miles fell into the river, and the remainder became badly deteriorated. Work was gradually resumed, but was not pushed actively until the United States began its coöperation in 1882. The volume in place at that time is estimated at 32,000,000 cubic yards. The total volume in the projected

system is estimated at 434,000,000 cubic yards, and the total volume in place in 1915 about 290,000,000 cubic yards, leaving a balance of about 144,000,000 cubic yards to be completed. In 1915 about 20 to 25 million cubic yards of new work were being added each year, and from 3 to 5 million cubic yards of old work lost by caving banks.

The standard levee cross section has a top width of 8 feet and side slopes of 1, vertical, to 3, horizontal. All levees over 12 feet in height are reinforced by a banquet, the top of which is 8 feet below the top of the main levee. The width of the banquet varies from 20 feet for a levee 12 feet high to 40 feet for a levee 20 feet high. The height of the levees, as a rule, varies from 15 to 25 feet, decreasing to 10 feet near the Gulf and increasing frequently to 30 feet where they cross old sloughs. The total amount expended on levees by the United States up to 1915 was about \$35,000,000, and by State and local organizations about \$100,000,000, or a total of about \$135,000,000. The amount of money necessary to complete the system was estimated at \$60,000,000 to \$75,000,000.

Passes and Jetties. At the head of the passes, 96 miles below New Orleans, the river divides into three main outlets: Pass à Loutre, which takes about 50 per cent of the discharge and subdivides into three smaller passes; Southwest Pass, which takes about 40 per cent of the discharge; and South Pass, which receives only about 10 per cent. Much work was done on the bars at the mouths of these passes in attempting to maintain ship channels across them. From 1836 to 1878 about \$2,500,000 were expended on various unsuccessful devices and plans. In 1875 Congress authorized James B. Eads to construct jetties and auxiliary works to develop a deep channel in the South Pass. He secured a 30-foot channel and was paid the contract price of \$5,250,000 and \$100,000 per annum for maintaining it from 1881 to 1900 inclusive. These are described and illustrated under JETTY.

The dredged channel in 1915 was about 75 per cent completed, about 25,000,000 cubic yards having been removed, giving a minimum width of 130 feet and a depth on the bar of 30 feet where there was originally only 9 feet. The length of the jetties is 4.5 miles, and the total length of the Southwest Pass, 19.5 miles.

Cost of Improvement. The total expenditures by the United States to June 30, 1914, on the improvement of the Mississippi River, including construction, maintenance, and operation of reservoirs, locks, and dams, are approximately as follows:

Snagging, St. Paul to New Orleans	\$4,400,000
Improvement works and dredging:	
Above St. Paul	4,300,000
St. Paul to mouth of Missouri River . .	21,100,000
Mouth of Missouri River to Cairo	16,200,000
Cairo to head of passes	46,700,000
Passes	20,300,000
Levees	33,500,000
Total	\$146,500,000

The amounts expended by the several States and local interests are not so well known, but are roughly estimated at about \$100,000,000 for levees and \$10,000,000 for docks and revetment works at the larger cities. The hydroelectric-power development at Keokuk represents an investment of \$25,000,000. Smaller water-power plants at Rock Island, St. Paul, and points farther upstream have cost many millions more.

Commerce. On account of the hard labor involved in paddling, poling, warping, or cordeling against the current, the commerce downstream, at first carried in flatboat, pirogue, Mackinaw boat, keel boat, and barge, was always greatly in excess of that upstream. Cheap boats were built on the upper waters of every large river, floated downstream with their produce, and then sold with their cargoes or abandoned. Previous to the year 1817 the whole commerce from New Orleans to the upper country was carried in about 20 barges, averaging 100 tons each and making but one trip in each year.

The first steamboat built in the Mississippi valley was the *New Orleans*, built at Pittsburgh in 1811. She was 138 feet long, had a capacity of 300 or 400 tons, and cost \$38,000. The sixth boat, the *Zebulon M. Pike*, built in 1815, was the first to ascend the Mississippi above the mouth of the Ohio and the first to touch at St. Louis (1817). By 1819, 63 boats had been built, and this indicates the rapidity with which the new form of navigation was being developed. The boats varied in size from 25 to 700 tons, but most of them ranged from 80 to 300 tons, the most popular size being 150 tons. The Cincinnati and Louisville Mail line, the first line of steamboats organized in the Mississippi valley, was established in 1818. Details of the first 63 boats built on the Mississippi and its tributaries are given in Scharf's *History of St. Louis* (Philadelphia, 1887).

On Jan. 1, 1834, an official list gave the total number of steamboats as 230, with an aggregate tonnage of 39,000. The capital invested was estimated at \$3,000,000. Of this number, 36 steamboats of over 200 tons plied between New Orleans and Ohio River points with an aggregate tonnage of 12,686; 4 in the St. Louis trade with an aggregate tonnage of 1002; 7 in the cotton trade with an aggregate tonnage of 2016; 57 boats, not in established trades, from 120 to 200 tons, aggregated 8641 tons; 126, under 120 tons, in various trades, aggregated 14,655 tons; grand total, 39,000 tons. Besides the steamboats it was estimated that 4000 flatboats annually descended the river, having an aggregate tonnage of 160,000. The total number of steamboats built from 1811 to Jan. 1, 1834, was 573; the difference between that number and the 230 in service represents the number worn out and lost, principally the latter.

In 1842 the number of steamboats employed in navigating the Mississippi and its tributaries was estimated at 450 with an average capacity of 200 tons each, making an aggregate of 90,000 tons. The cost of these boats was estimated at \$7,000,000, and the number of men operating them at 35,000. The first company organized to operate a line of steamboats on the upper Mississippi was established that year. The number of steamboat arrivals at St. Louis during the year 1842 was 2412, with 467,824 tons, besides 891 flatboats and exclusive of the daily packets to Alton. At New Orleans the number of arrivals was smaller, but the tonnage was larger—550,500 tons, valued at \$50,000,000. The number of steamboats lost each year was surprisingly large. In 1846, 36 vessels were lost, of which 24 were sunk by snags and submerged rocks and the remainder by fire, explosion, and collision. During the same year 108 new boats were built with a tonnage of 51,660 at a cost of \$1,450,000.

The transportation of coal down the Ohio and

Mississippi, which was destined to develop into such large proportions, began in a small way in the early forties. In 1844 it amounted to 737,000 bushels; in 1845, 4,605,000; in 1850, 12,298,000; in 1860, 37,948,000; in 1870, 57,596,000; in 1880, 84,048,000; in 1886, 109,895,000.

The official returns of St. Louis for the year ending June 30, 1853, show 3307 arrivals with a tonnage of 45,401. This was exceeded only by the tonnage of New Orleans and New York. In consequence of an unusual low-water season in 1860, freight rates on the upper Mississippi, Missouri, and Illinois ruled very high, and the number of marine disasters reached the astounding total of 299. This was followed by a general paralysis of all industries and commerce during the next four years, so that after the Civil War it was necessary to start all over again. In this rebuilding most of the steamboats and barges were built of larger proportions than before the war.

The rise and decline in river traffic is well shown in the accompanying extracts from the annual reports of the Merchants Exchange of St. Louis.

PORT OF ST. LOUIS

YEAR	ARRIVALS				DEPARTURES	
	No. of boats	No. of barges	Tons of freight received	Tons of lumber rafted	No. of boats	Tons of freight

* Approximate.

There was a decline in river commerce from 1870 to 1877, followed by a revival for a few years, since which there has been a steady decline. The decline on the Ohio and lower Mississippi has also been quite marked, but not to so large a degree as at St. Louis. The freight delivered at New Orleans by river in 1909, expressed in tons, was as follows: coal, 740,000; lumber, 110,000; gravel, 150,000; cotton, 60,000; oil, 40,000; provisions, 38,000; iron and steel, 15,000; passengers, 5000.

The cause of the decline in river commerce is a mooted question. Primarily it has been due to the more efficient service rendered by the railroads, combined with rate cutting by the railroads in favor of river towns. The latter practice was stopped by the Interstate Commerce Commission, but the damage was already done. To the above must be added (1) uncertainty and irregularity of service; (2) instability of rates; (3) short life of the individual steamboat; (4) lack of effective line organization; (5) extravagance engendered by early prosperity. The likelihood of a revival of river commerce is also a mooted question. If it is accomplished, as many hope and believe it will be, it will no doubt be along the lines successfully adopted in Europe: (1) ample and efficient

river terminals maintained by the municipalities for the use of all boats; (2) the operation in each line of a large number of boats by companies with ample capital working in coöperation with the railroads; (3) the separation of freight and passenger traffic, using fast steel packets with modern accommodations for passenger service and powerful and efficient towboats with covered steel barges for freight traffic.

MISSISSIPPI SCHEME. A gigantic banking and commercial scheme projected in France by the celebrated Scottish financier John Law (q.v.), at the beginning of the reign of Louis XV. The primary object of the scheme was to resuscitate the French finances by removing some of the debt and disorder which had followed on the wars of Louis XIV. Money was to flow into France by developing the resources of the Province of Louisiana and the country bordering on the Mississippi—a tract at that time believed to abound in the precious metals. The company was incorporated in 1717, under the designation of the *Compagnie d'Occident*, and started with a capital of 100,000,000 livres. Two hundred thousand shares were placed on the market and eagerly bought up. The company obtained exclusive privileges of trading to the Mississippi for 25 years, of farming the taxes, and of coining money. In 1718 the company changed its name to the *Banque Royale*, and the King guaranteed the notes. In 1719 it obtained a monopoly of trading to the East Indies, China, the South Seas, and all the possessions of the French East India Company, and the brilliant vision opened up to the public gaze was irresistible. The *Compagnie des Indes*, as it was now called, created 50,000 additional shares; but there were at least 300,000 applicants for these, and consequently shares rose to an enormous premium. The public enthusiasm became absolute frenzy, and while confidence lasted, a fictitious impulse was given to trade in Paris; the value of manufactures was increased fourfold, and the demand far exceeded the supply. The population of Paris is said to have been increased by hundreds of thousands, many of whom were glad to take shelter in garrets, kitchens, and stables. But the Regent Orléans had meanwhile caused the paper circulation of the national bank to be increased as the Mississippi scheme stock rose in value, and paper currency to the face value of 2,700,000,000 livres flooded the country. The result was that many wary speculators, foreseeing a crisis, secretly converted their paper and shares into gold, which they transmitted to England or Belgium for security. The increasing scarcity of gold and silver in France becoming felt, a general run

was made on the national bank, which in February, 1720, had been incorporated with the *Compagnie des Indes*. On May 21 the government issued an edict which reduced the value of bank notes and of shares in the company by one-half. Law was now Comptroller General of the Finances, and he made several unavailing attempts to mend matters. Those suspected of having more than a limited amount (fixed by a law passed at the time) of gold and silver in their possession, or of having removed it from the country, were punished with the utmost vigor. The final crisis came in July, 1720, when the bank stopped payment, and Law was compelled to flee the country. A share in the Mississippi scheme now with difficulty brought 24 livres. An examination into the state of the accounts of the company was ordered by the government; much of the paper in circulation was canceled; and the rest was converted into stock.

MISSISSIPPI SOUND. A lagoon-like strait, 5 to 10 miles wide, washing the coasts of Alabama and Mississippi from Mobile Bay to the entrance of Lake Borgne, a distance of about 70 miles (Map: Mississippi, H 10). It is formed and separated from the Gulf of Mexico by several long and narrow islands or sand bars, one of which is fortified. It is generally tranquil, has a depth of from 6 to 10 feet, and is navigated chiefly by the steamers and coasting vessels running between Mobile and New Orleans by way of Lake Pontchartrain.

MISSOLOGHI, mī-sō-lōŋ'gē, or MESOLOGHI. One of the principal towns of western Greece, the capital of the Nomarchy of Acarnania and Ætolia (Map: Greece, C 5). It is situated on the north shore of the Gulf of Patras, in a marshy and unhealthy locality. The harbor is shallow and inaccessible for large vessels. The town is the seat of an Archbishop. It has a statue of Lord Byron, who died here in 1824, and a mausoleum which contains the heart of the poet. The town is famous as the chief western stronghold of the Greek patriots during the war of liberation (1822-26). Under Markos Bozzaris it withstood a siege by the Turks in 1822, and again from 1825 until April, 1826, when the survivors of the garrison destroyed the town and cut their way through the Turkish lines. Outside the gates stands the *Heroon*, or burial place of those who died during the defense. In May, 1829, the town was evacuated by the Turks and restored to Greece. Pop., 1896, 8394; 1907, 10,702.

MISSOULA, mī-zōō'lá. A city and the county seat of Missoula Co., Mont., 125 miles by rail west by north of Helena, on the Missoula River and on the Northern Pacific and the Chicago, Milwaukee, and St. Paul railroads (Map: Montana, C 3). It is the seat of the State University, contains Fort Missoula, and has a Carnegie library, attractive Federal building, high school, and two hospitals, one maintained by the Northern Pacific Railroad. The city is in a farming and fruit-growing, lumbering, and mining region, for which it is an important distributing centre, and controls a considerable trade in grain, fruit, and produce. There are large lumber mills, a brewery and bottling works, and railroad shops of the Northern Pacific. Founded in 1864, Missoula was first incorporated in 1887, and has adopted the commission form of government. Pop., 1900, 4366; 1910, 12,869; 1914 (U. S. est.), 16,492; 1920, 12,668.

MISSOURI, mī-sōō'rī or mī-zōō'rī; *locally*

often mī-zōō'rū. A State of the American Union occupying a central position in the great interior lowland drained by the Mississippi and its tributaries. It lies a little to the east of the geographic centre of the country. It is separated from Iowa on the north by the parallel of 40° 30' N. and from Arkansas on the south by that of 36° 30' N. Its most easterly point lies in long. 89° 53' W. Its east boundary is an irregular line marking the middle of the Mississippi River channel as it was at the time the boundary was defined, even though this is not in all cases the middle of the channel at the present time. This boundary separates the State from Illinois, Kentucky, and Tennessee. North of Kansas City the west boundary is formed by the Missouri River channel, with exceptions as just noted along the east boundary, and south of that point by the meridian of 94° 43' W. This line separates the State from Kansas and Oklahoma. Its land area is 68,727 square miles.

Topography. The area of the State includes portions of three of the great topographic provinces of the United States; which may be designated as the prairie plains, the Ozark region (Appalachian province), and the coastal plain. These provinces are differentiated on the basis of existing topography and of history of natural evolution. The prairie plains occupy all of the northern part of the State except a narrow belt along the Missouri River east of Glasgow and one along the Mississippi in Marion, Pike, and Lincoln counties. They occupy the western part of the State west of a line running approximately from Glasgow through eastern Pettis, western Cedar, the southeastern corner of Barton, and the middle of the west boundary of Jasper counties.

Along their eastern border their upland surface lies at elevations ranging from 750 to 900 feet. Westward, leaving out of consideration the valleys, the elevation across the northern tier of counties increases gradually to about 1100 feet in Mercer County, west of which there is a very gradual decline to about 950 feet along the Missouri River bluffs. Westward along the southern counties, however, the elevation remains constant to a north-south line through Richmond, Braymer, Trenton, and Ravanna, along which there is an abrupt rise of about 100 feet. West of this there is a slight decline to the Missouri River bluffs. Along the Mississippi there is a narrow belt of sharply dissected country, best described as hilly. West of this and east of the Wabash Railway through Moberly, Macon, and Kirksville the topography consists of rather broad flat or undulating plains on the watersheds with belts of low hills bordering the valleys. West of the Wabash Railway all of the northern part of the State is essentially a rolling to undulating plain. Areas of flat upland are few and small. South of the Missouri River the prairie plains consist of a smooth to undulating eastern belt and a rolling western belt. The boundary between them runs approximately from Lexington through Odessa and Pleasant Hill and across the northwest corner of Bates County. Along this line there is a rise of about 150 feet from the lower eastern to the higher western belt. North of the Missouri River the surface of the prairie plains has a thin veneer of glacial material which does not occur south of the river. It does not, however, change the essential features of the topog-

raphy from what they would be if the veneer were removed. The Ozark region occupies all that part of the State not occupied by the prairie plains except the area south of Cape Girardeau and Poplar Bluff. It is essentially a plateau which slopes gently and almost imperceptibly to the surrounding country. Its upland surface ranges in elevation, except around the border, from about 1200 feet in the eastern and central part to 1700 feet in the southwestern part. Its typical plateau surface is interrupted in Iron and adjoining counties by a number of low blunt peaks and short rounded ridges of hard igneous rocks known as the St. Francis Mountains. The plateau surface would be smooth but for the great number of valleys that traverse it. These have made of it a hilly country as a whole. The portions with the greatest number of, the deepest and most sharply cut, valleys are the White and Current River basins, the lower Niangua, and the Central Osage and Gasconade basins. The valleys reach a maximum depth of about 500 feet in the White and part of the Niangua basins and 350 feet or more in the others. In other basins besides those mentioned the valley depths are less, but usually the valley borders are very hilly. There are several rather small areas, however, that are not yet invaded by valley-making forces. The most important of these are the Salem-Rolla, the Lebanon, the Eldon, the Owensville, and the Springfield areas. The coastal plain in Missouri lies in the extreme southeastern part. It barely exists as a true coastal-plain area, most of it having been converted long ago into broad, level river valleys. The true coastal plain exists only in a narrow ridge broken into two parts known as Crowley and Benton ridges. The former runs southward through Stoddard and Dunklin counties, the latter lies in Scott County. The coastal-plain ridges are less than 150 feet high and have a rolling upland surface. The rest of the area in the State south and east of the Ozark boundary, running through Cape Girardeau, Mingo, Poplar Bluff, and Naylor, is flat alluvial land. From the foregoing it will be seen that the topography of the State, leaving the valleys out of consideration, is of plains varying in elevation. Their original surfaces have been almost completely destroyed by the cutting of valleys in them. The later, except the short ravines, are almost invariably flat-bottomed and floored with alluvial deposits. They are broadest in the coastal-plain region, reaching a maximum width of about 40 miles. In the Ozark region they are rarely more than half a mile wide, and in the prairie region they range up to a maximum, along the large rivers, of about 5 miles.

Hydrography. The State is drained by streams flowing eastward into the Mississippi River either directly or through the Missouri and Arkansas. The river systems are well developed and reach effectively practically all the upland area of the State. Swamps due to imperfectly developed river systems like those in the recently glaciated areas of the Northern States do not exist. The nearest approach to such conditions occurs on the nearly flat watershed ridges, or plains remnants, in the north-eastern part of the State. They are not swampy, however.

Geology. In age the consolidated rocks underlying the area of the State are Archean, Paleozoic, and Cenozoic. In mineralogical character

L.L. POATES ENGINE CO., N.Y.

Longitude 93° West

they have a relatively wide range. The rocks of the Ozark region are predominantly limestones. The small area of the St. Francis Mountains is underlaid by igneous rocks consisting of granites and fine-grained eruptives mainly acidic. At one point, the extreme summit of Pilot Knob in Iron County, there is an area of slates, conglomerates, and iron ores that may be Algonkian in age. At a few points and in small areas sandstones occur among the predominant limestones in the Ozark plateau. The Ozark limestones are almost invariably cherty. The rocks underlying the prairie region are predominantly shales, interbedded with limestone and sandstone beds, all of Paleozoic age. The coastal-plain rocks, only partially consolidated, consist of shales, clays, and sands, presumably of Tertiary age. The unconsolidated rock material of the State is of Glacial age north of the Missouri River, of recent but undetermined age south of the same stream, and of recent age in the valleys. The glacial material is predominantly a sandy clay with a layer of silty material overlying it, the origin of which is yet undetermined. The unconsolidated material in the prairie region south of the Missouri consists mainly of clays and silts derived from the decay of rock in places similar to those on which it lies. In the Ozark region it consists mainly of red clay and silt filled with fragments of stone, mainly chert. The alluvial material ranges from clay to sand.

Climate. Missouri lies in the milder half of the warm temperate zone. Being far inland, the State is subject to the extremes of a continental climate, which are all the more accentuated by the fact that it is in the path of frequent cyclonic storms. The average January temperature ranges from 35° F. in the southeastern to 20° F. in the northwest corner. For July the temperature is 80° F. in the extreme south and 75° F. in the extreme north. The average date of the last killing frost in spring is about the middle of April, though it may occur as late as the middle of May. The average date of the first killing frost in the fall is about the middle of October, though it may occur as early as September 25. The average length of the growing season is about 180 days, with a minimum of about 130 days. The different parts of the State do not differ widely in these respects, though the southeastern lowlands are considerably milder than the rest of the State. In summer the mercury sometimes rises to 105° F., while the anticyclones of winter carry the minimum of 10° below to the southern border and 20° below to St. Louis, thus giving that city an annual range of 125°. The southeastern extremity of the State has not a day in the year with the average temperature below freezing, but the record rises rapidly northward, there being 30 such days in Springfield, 60 at Jefferson City, and 90 at Rockport. The summers are pleasantly tempered in the Ozark plateau.

The rainfall ranges from 35 inches per year in the north to 50 inches at the Arkansas line. While this is well distributed through the year, there is a marked minimum in the winter season and maximum in the summer season. Droughts lasting 30 days sometimes occur. Snow falls on the average to the depth of 20 inches in the latitude of St. Louis and less than 10 inches at the Arkansas line, though it rapidly disappears and seldom covers the ground many days. The average relative humidity for the

year is less than 70 per cent over the whole State. The prevailing winds are west and north-west in January and south in July. There are on the average 30 thunderstorms in the year, with a maximum frequency in June.

Soils. The soils vary with the underlying character of the rock, the topography, and the drainage. In the Ozark region they are gray, brown, or red in color, rarely black, and are well drained in both soil and subsoil. The texture of the fine material is usually fine grained, silt loams predominating in the soils and silty clays in the subsoil. They are rather stony, and occur, as a rule, on a rolling to rather rough topography, the stone content being predominantly chert. The gray soils are usually deficient in lime while the red soils and the subsoils carry a fair amount. In the prairie region the soils are rather light in color in the eastern part, becoming darker westward and northward. They are, as a rule, somewhat heavier than the Ozark soils, are practically stone free, have good surface drainage except on flat areas, and have a moderate lime content except the soils on the flat areas in the eastern part. The subsoils, except the Missouri River belt, are heavier than the soils. In most of the prairie region the soils are dark enough to be called black. In the southern part, the soils are mostly alluvial and, like these soils in all other parts, are fertile. They are predominately brown in color and range from clays to sands in texture.

Large areas need artificial drainage, and this is rapidly being furnished. The soils in Crowley and Benton ridges are brown silt and clay loams, much like the river bluff soils farther north.

Vegetation. See *Forest Products*, below.

Mining. The principal mineral products of Missouri are spelter (zinc) and lead, in which it ranks first among the States. It leads in the production of barytes and tripoli and ranks second in the production of mineral paints. The combined value of spelter and lead represents about 60 per cent of the entire mineral output of the State. From 40 to 45 per cent of both the spelter and the lead produced in the United States comes from Missouri. The lead ores of Missouri carry very little silver, and the lead produced is known as "soft lead." The principal lead-producing counties are St. Francois and Madison. The southeast Missouri lead region has made the greatest gains in production of all the lead-producing districts of the United States and since 1908 has annually exceeded the production of the Cœur d'Alene region in Idaho, which formerly held first rank. The ore of the southeast Missouri region is almost wholly lead ore, although, particularly in the southern portion, there are in many places considerable copper, nickel, and cobalt mixed with the lead. The total output of lead concentrates in 1913 was 255,723 short tons, valued at \$11,444,935. The recoverable lead content of Missouri ores amounted to 176,116 short tons, valued at \$15,498,208. Nearly all the production of sphalerite ores is in the Joplin district, in southwestern Missouri. The recoverable zinc content of the ores produced in 1913 amounted to 124,963 short tons of metal, valued at \$13,995,856. The mining of coal ranks third among the mineral industries. Missouri was the first State west of the Mississippi River to enter this field, and in 1840 produced 9772 short tons.

The industry, however, has shown little progress as compared with neighboring States, owing to the competition of the oil and gas fields of Kansas and Oklahoma and the more cheaply mined coal of Illinois and other States. The coal-producing area lies entirely north and west of a line drawn from the northeastern to the southwestern corner. The coal production in 1913 was 4,318,125 short tons, valued at \$7,468,308. The occurrence of coal in Missouri appears to have been known as early as 1806, when it was noted by Zebulon M. Pike on the banks of the Osage River. Clay products are fourth in value of the mining industries. While ranking seventh among the States in the total value of its clay products, it ranks second in the manufacture of fire brick. The chief centre of this industry is the immediate vicinity of St. Louis. The refractory brick made in Missouri are of especially high grade, and the average price of its fire brick is higher than that of any other State with the exception of New Jersey. The total value of clay products in 1913 was \$6,602,076. Portland cement is another of Missouri's important mineral products. In 1913 the production amounted to 4,485,820 barrels, valued at \$4,556,822. Cement plants are located near St. Louis and Kansas City and also at Hannibal and Cape Girardeau. The quarry products, chiefly limestone, were valued at about \$2,538,699. A comparatively large quantity of lime is produced. This in 1913 amounted to 161,770 short tons, valued at \$734,009. Sand and gravel are also important mineral products. Other mineral products are copper, occasional gems, iron ore, mineral waters, natural gas, pyrite, and silver. The total value of the mineral products in 1913 was \$54,001,088.

Agriculture. Of an approximate land area of 43,985,280 acres in 1910, 34,591,248 acres were in farms, of which there numbered 277,244. The improved land in farms amounted to 24,581,186 acres, or 56 per cent of the total area. The average acres per farm were 124.8 in 1910, and the total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$2,052,917,488. The average value of all farm property was \$7405 in 1910, and the average value of land per acre \$41.80, an increase per farm of \$21.34 over 1900. Of the total number of farms in 1910, 194,286 were operated by owners and managers. There were, in 1910, 259,111 native white farmers, 14,467 foreign-born white, and 3666 negro and other nonwhite. Of the foreign-born white farmers 8453 were born in Germany.

The following table shows the acreage, production, and value of some of the principal crops in 1914. The figures are estimates of the United States Department of Agriculture.

PRODUCTS	Acreage	Prod. bu.	Value
Corn.....	7,200,000	158,400,000	\$107,712,000
Wheat.....	2,549,000	43,333,000	42,466,000
Oats.....	1,200,000	25,800,000	11,352,000
Rye.....	17,000	238,000	207,000
Potatoes.....	87,000	3,915,000	2,858,000
Hay.....	2,600,000	*1,820,000	24,752,000
Tobacco.....	4,100	†4,920,000	640,000
Cotton.....	122,000	‡75,000	2,336,000

*Tons.

† Pounds.

‡ Bales.

The total value of crops in 1909 was \$220,664,000 and the combined acreage was 14,335,588,

representing 58.3 per cent of the total improved land in farms. The general character of agriculture is indicated by the fact that about two-thirds of the total value of crops in 1909 was contributed by cereals and 15.3 per cent by hay and forage. The remainder consisted chiefly of potatoes and other vegetables, forest products, and fruits and nuts. The leading crops in 1909 in order of their importance as judged by value were corn, hay and forage, wheat, oats, potatoes, and cotton. Corn, the most important crop, had an acreage of 7,113,953 in 1909. The production was 191,427,007 bushels, valued at \$107,347,033. Hay and forage had an output valued at \$33,845,000, the acreage being 3,628,348. In that year wheat, the third important crop, had an acreage of 2,017,128 and an output valued at \$29,926,000. The acreage of cotton in 1909 was 96,527, from which were produced 54,498 bales, valued at \$3,392,440. The total acreage of potatoes and other vegetables in 1909 was 233,767 and their value \$13,305,829. Excluding potatoes and sweet potatoes and yams, the acreage of vegetables was 129,570 and their value \$8,268,000.

The production of orchard fruits, chiefly of apples, is an important agricultural industry. The total quantity grown in 1909 was 11,957,399 bushels, valued at \$6,582,578. Of the total production apples contributed 9,968,977 bushels, with a value of \$4,885,544. Other important orchard fruits are peaches and nectarines, pears, plums, prunes, and cherries. The production of grapes in 1909 was 17,871,816 pounds, valued at \$488,765. Of small fruits the most important is the strawberry, of which 15,171,034 quarts, valued at \$1,122,784, were grown in 1909. The total production of small fruits was 23,696,221 quarts, valued at \$1,761,409. Sorghum cane is produced in important quantities. This in 1909 amounted to 201,206 tons, and from it were made 1,788,391 gallons of sirup, valued at \$876,970. Tobacco is an important product in some portions of the State. In 1909, 5433 acres were planted to tobacco, and the production was 5,372,738 pounds, valued at \$636,479.

Live Stock and Dairy Products.—The total value of domestic animals of all kinds on the farms in 1909 was \$273,366,662. Missouri has always been noted for the quantity and value of its mules. On Jan. 1, 1915, it was estimated that there were 1,414,000 cattle other than milch cows, valued at \$53,591,000; milch cows numbered 747,000, valued at \$43,436,000; horses, 1,095,000, valued at \$96,360,000; mules, 329,000, valued at \$32,242,000; sheep, 1,490,000, valued at \$7,450,000; swine, 4,250,000, valued at \$34,425,000. The total value of milk, cream, and butter fat sold and butter and cheese made in 1909 was \$13,685,318. There were sold 15,733,185 gallons of milk and 14,646,771 pounds of butter. The total number of fowls of all kinds in 1910 was 20,897,208, valued at \$11,870,972.

Forest Products. The timber lands north of the Missouri River are restricted mostly to the river valleys, while the Ozark region south is normally a forest area of largely mixed hardwoods, thinning out westward. The forest area in 1908 was 28,600 square miles, or 42 per cent of the total. The logging and milling operations are confined largely to the wooded Ozark region of southern Missouri, while many of the planing mills and box factories are located in the larger cities. With the exception of the boot and shoe factories the

lumber industry gives employment to more persons than any other industry. The fertility of the soil gives the hardwoods a decided advantage over evergreens in most parts of the State. There is only one pine (short-leaf, *Pinus*

facilities, are factors favorable to the growth of their manufacturing industries.

The table below gives the most important figures relative to the 10 leading industries in 1909 and 1904.

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of estab-lish-ments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufac-ture
			Total	Wage earners (average number)				
All industries	1909	8,375	185,705	152,993	\$444,343	\$80,843	\$574,111	\$219,700
	1904	6,464	156,585	133,167	379,369	66,644	439,549	187,291
Boots and shoes, including cut stock and findings	1909	59	18,665	17,396	15,838	8,164	48,751	14,211
	1904	37	10,949	10,451	8,290	4,349	23,541	8,588
Bread and other bakery products..	1909	954	6,797	4,743	17,043	2,487	18,524	7,695
	1904	614	4,962	3,764	7,416	1,816	12,672	5,391
Clothing, men's, including shirts..	1909	84	8,667	7,994	8,109	2,994	15,407	6,336
	1904	73	6,500	6,070	5,037	2,098	10,329	4,786

echinata), and that is chiefly confined to the Ozark region. One other evergreen, the cedar, is widely distributed over the State, but not very abundant, and cypress, a deciduous conifer, is found in considerable quantities in the alluvial bottoms in the southeast. The remainder of the forest is made up of hardwoods. The thirteenth census reports 2076 saw mills in Missouri, with the following production of lumber, lath, and shingles for 1909, in M feet, B. M.: *Conifers*—pine, 142,271; cypress, 32,891; cedar, 2984. *Hardwoods*—oak, 271,623; red gum, 83,905; hickory, 33,259; elm, 27,913; cottonwood, 17,987; ash, 12,685; sycamore, 10,526; maple, 10,376; tupelo gum, 4351; walnut, 4314; yellow poplar, 1791; birch, 1115; basswood, 1990; all others, 1078. Total, 660,159 M feet, valued at \$10,041,472. The total value of manufactured products in 1909 was \$23,261,000. In addition to the figures above there were produced on the farms of the State in 1909 forest products valued at \$8,406,823.

Manufactures. Missouri's prominent industrial position is due largely to the activity of the industries of St. Louis and Kansas City. It ranked well in manufactures as early as 1849, in which year it was tenth in value of products. In 1909 it held the same relative position. In that year the gross value of products per capita was \$174. Its abundant mineral supply has resulted in the development of such industries as smelting and refining copper, lead, and zinc, marble and stone work, iron and steel blast furnaces, kaolin and ground earths, glass, and paints. Extensive timber areas have provided abundant material for the development of the lumber and timber industries. The location of the cities in the midst of a great agricultural region and their proximity and access to raw materials, as well as their excellent shipping

The most important industry is that connected with slaughtering and meat packing. Missouri is located in the centre of a hog-raising area; it is one of the great corn-growing States and has extensive feeding and grazing areas for cattle in the prairies of the north and for sheep in the Ozarks of the south. These features have been very important factors in the development of this industry. The total number of hogs slaughtered in 1909 was 2,471,658, valued at \$36,911,941. In addition there were 530,356 beeves slaughtered, valued at \$24,332,919; 81,551 calves, valued at \$821,829; and 546,649 sheep, valued at \$2,659,215. The manufacture of boots and shoes, which was second in importance in 1909, measured by value of product, has shown a remarkable development. As a result of this pronounced growth Missouri became second in the industry in 1909. The industry gave employment to more wage earners than any other in 1909, and is not confined to the larger cities, but exists in many small cities and towns. In 1909, 24,657,160 pairs of boots and shoes were made. The manufacture of flour-mill and gristmill products occupied third place in value of products in 1909. Most of the mills are small and are located in the rural districts, but there are several very large mills in the cities. There were produced, in 1909, 5,661,379 barrels of white flour, valued at \$29,995,104. The manufactures of graham flour, corn meal and corn flour, and feed are also important. One of the distinctive industries of the State is the manufacture of smoking pipes. The world's supply of corncob pipes is manufactured largely in Missouri.

There was in 1909 an average of 152,993 wage earners, of whom 122,266 were males. The wage earners 16 years of age and under numbered 3818, of whom 2286 were males. For

nearly three-fourths of the wage earners employed the prevailing hours of labor range from 54 to 60 a week. The most important manufacturing city is St. Louis. There were in this city, in 1909, 87,371 wage earners, and the value of its manufactured products was \$328,495,313. St. Louis (q.v.) held in 1909 fourth place in the value of manufactured products among the cities of the United States and third place in the manufacture of boots and shoes. All of the tanneries, the baking-powder establishments, and practically all of the soap works of the State are located here. There were in Kansas City (q.v.), in 1909, 14,643 wage earners, and the value of its manufactured products was \$54,704,510. St. Joseph (q.v.), the third city in manufacturing rank, had, in 1909, 5390 wage earners and a product valued at \$17,625,682.

Transportation. Missouri is one of the leading States in mileage of navigable rivers. It is also well equipped with transportation facilities by land. The northern half is covered by a network of railroads. In the southern half, however, the mileage is small and a number of counties have no railroad communication. The northern half has the advantage of lying in the course of some of the great transcontinental lines and is less broken than the southern part. St. Louis, Kansas City, and St. Joseph on the western border are large railroad centres. The railway mileage was 8153 in 1913. The chief lines are the Missouri Pacific, the Atchison, Topeka, and Santa Fe, the St. Louis and San Francisco, the Kansas City Southern, the Chicago, Burlington, and Quincy, the Chicago and Alton, the Wabash, and the Missouri, Kansas, and Texas. Railroad rates are in charge of the Board of Railroad Commissioners, who hear and determine complaints against the railroads, but their decision is subject to revision by the courts. There is a large amount of water traffic between St. Louis, the terminal for the larger steamers, and the Gulf. Competition of the railroads, however, is tending to decrease this. The grain and animal produce of the West reaches its market in great part by way of Missouri. The mileage of electric railways in 1912 was 852. The total number of companies operating electric roads in that year was 19.

Banks. The Bank of St. Louis, chartered in 1813 and opened in 1816, was the first in the State. It went into liquidation in 1819. Next came the Bank of Missouri, which opened in St. Louis in 1817 and failed in 1822. This left the State without any chartered banks until 1829, when the United States Bank opened a branch in St. Louis. The branch was discontinued in 1833. The Bank of the State of Missouri, chartered in 1837, was a large institution with five branches in the State and was a bank both of issue and of discount. For 20 years it had almost a monopoly of the banking business, but its circulation was insufficient and in 1857 seven more banks of issue were chartered. Many more followed. All were forced to conform to the law which allowed the issue of only three dollars for every dollar specie. The law of 1857 provided also for a bank commissioner, who should visit and examine the various institutions. This office was soon abolished and there sprang up a number of small speculative banks, all of which collapsed in the panic of 1873. The system of national banking extended

very slowly, but the largest institutions sooner or later became the national banks. In 1868 the St. Louis Clearing House Association was organized with 35 members. Trust companies were first formed in 1889 and became very popular. There always have been many banks bearing the word "savings" in their titles, but none of them conformed to the general plan of a savings bank. In September, 1914, there were 130 national banks, with an aggregate capital of \$35,570,000. Their combined surplus was \$15,986,118; cash, etc., \$7,832,484; loans, \$306,486,630; and deposits, \$143,165,947. The State banks on June 30, 1914, numbered 1250. Their combined capital was \$34,845,350; surplus, \$18,552,198; cash, etc., \$11,245,644; loans, \$208,877,432; and deposits, \$207,570,909. Bank clearings at St. Louis in 1914 amounted to \$4,051,000,000 and at Kansas City to \$3,015,810,567. In 1914 Federal Reserve Banks were located at these cities.

Government. The present constitution, which has been amended in important details, was adopted in 1875. Amendments must be passed by a majority of the members of each House of the General Assembly, after which they are submitted separately to the people at the next general election. The General Assembly may also at any time authorize a vote of the people to be taken upon the question whether a constitutional convention shall be held.

Legislative.—The legislative power is vested in a Senate and a House of Representatives, called the General Assembly. The House of Representatives consists of members chosen every second year, who are apportioned according to the population of the counties. A representative must have attained the age of 24 years and have been a qualified voter for at least two years. The Senate consists of 34 members, chosen from districts of approximately equal population. Senators must be at least 30 years of age and qualified voters for three years. The initiative and referendum were adopted by a constitutional amendment in 1908.

Executive.—The executive department consists of a Governor, Lieutenant Governor, Secretary of State, State Treasurer, State Auditor, Attorney-General, and Superintendent of Public Schools, all of whom, except the Lieutenant Governor, must reside at the seat of government during their term of office. The supreme executive power is vested in the Governor. He must be at least 35 years of age at the time of his election, have been a citizen of the United States 10 years and a resident of the State seven years next before his election. The Governor and Treasurer are ineligible for reelection. The term of all the executive officers is four years.

Judiciary.—The judicial power is vested in a supreme court, courts of appeals, circuit courts, and others of minor importance. The supreme court consists of seven judges and is divided into two divisions. The courts of appeals consist each of three judges who are elected by the qualified voters of the appellate district for a term of four years. Separate and district courts exist in each county, presided over by a circuit judge, although his circuits may comprise several counties. Judges of the circuit court are elected and hold offices for terms of six years. Each county has a probate court and a county court.

Suffrage and Elections.—Persons qualified to vote are males over 21 years of age who are

citizens of the United States or who have declared their intention of becoming such not less than one year nor more than five years preceding the election and who have resided in the county 60 days immediately previous to the day of election. General elections in the State are held biennially on the Tuesday next following the first Monday in November, dating from 1876. All elections must be by ballot. The Legislature of 1913 made important changes in the general election and primary laws. These amendments were embraced in 10 separate acts, the most important relating to primary elections. There is a stringent corrupt-practices act.

Local and Municipal Government.—The General Assembly has no power to establish any new county with a territory of less than 410 square miles. Municipalities are not permitted to subscribe to the capital stock nor aid corporations or institutions. Townships may be organized whenever a majority of the legal voters of the county shall so determine. Cities having a population of more than 100,000 may form a charter for their own government. These charters must provide for a mayor or chief magistrate, and two houses of legislation, one of which at least shall be elected by a general ticket. Provision is also made for adoption by cities and towns of a commission form of government.

Other Constitutional and Statutory Provisions.—Imprisonment for debt is not permitted. Corporations cannot be created by special laws. Railroad companies may not charge for the transportation of freight or passengers a greater amount for a less distance than the amount charged for any greater distance. There is a blue-sky law, patterned after the Kansas statute. There is a white-slave act, conforming in its essential features to the Mann Act. The State is under local-option law, which permits the liquor question to be settled by a vote of the people in each county, excepting only from its operation cities containing a population of 2500 or more and permitting these to vote as separate units.

Finance. Missouri's first public debt was acquired in 1835, when it bought stock in the banks of the State. This amounted to \$1,397,000. Quite unlike many other States, it was not involved in financial difficulties due to its banking enterprises and was free from extensive debt up to 1850. Then began the era of speculative railroad construction, and within the next eight years many railroads were chartered, receiving from the State loans in the shape of guaranteed bonds amounting to about \$24,000,000. The railroads failed to pay the interest, and the State had to assume the entire debt, which amounted to \$27,370,000 in 1862. The debt remained above \$20,000,000 until 1880, but has been reduced, and in 1915 it was \$7,308,339. This is divided among the State school fund (\$3,159,000), the State seminary fund (\$1,239,839), and the capitol building fund (\$2,909,500). For the year ending Dec. 31, 1914, the total receipts were \$10,540,264, the disbursements were \$9,618,813, and the balance in the Treasury was \$4,942,011.

Militia. The males of militia age in the State in 1910 numbered 721,866. The organized militia in 1914 consisted of a division of infantry, including the first, second and third, fourth and sixth regiments, a cavalry troop, two field artillery troops, a signal troop, and sanitary troop.

The strength of enlisted men was 3320 and of officers 256.

Population. The population at different periods is as follows: 1810, 20,845; 1820, 66,586; 1840, 383,702; 1850, 682,044; 1860, 1,182,012; 1870, 1,721,295; 1880, 2,168,380; 1890, 2,679,184; 1900, 3,106,665; 1910, 3,293,335. The estimated population on July 1, 1914, was 3,372,886; 1920, 3,404,055. In 1910 Missouri ranked seventh in population. The white population was 3,134,932 in 1910. The foreign-born white population was 228,896, and the negro population, which is confined largely to the Missouri and Mississippi River counties, was 157,452. Of the foreign-born white the most numerous are Germans, followed by Irish, Russians, Italians, and Austrians. St. Louis was an early centre of German immigration, and the Germans still constitute over one-half of the total foreign-born population of that city.

Of the total population in 1910, 67.4 per cent were born in the State. Of the remainder 5.6 per cent were born in Illinois, 2.3 per cent in Kentucky, 2 per cent in Kansas, 2 per cent in Ohio, 1.9 per cent in Indiana, 1.8 per cent in Tennessee, 1.7 per cent in Iowa, nearly 1 per cent in Pennsylvania, less than 1 per cent in each of the other States, and 6.9 per cent in foreign countries. The population in places of 2500 or more in 1910 was 1,398,817. The rural population was 1,894,513. In 1910 there was an average of 47.9 persons per square mile, a greater density than is shown in any other State west of the Mississippi. There were, in 1910, 15 cities with a population of 8000 or over. The largest city, St. Louis, had in 1910 a population of 687,029 and in 1914 an estimated population of 734,667. Kansas City had in 1910 a population of 248,381 and in 1914 an estimated population of 281,911. Other large cities with their populations in 1910 are: St. Joseph, 77,403; Springfield, 35,201; Joplin, 32,073; Hannibal, 18,341.

Education. Educational problems of Missouri are in general those of other Southern States which have a large rural population. Persistent efforts have resulted in material improvement of conditions. The percentage of illiteracy among all classes was 4.3 in 1910, the number of illiterate persons of 10 years of age or over being 111,116. The percentage of illiteracy among native whites of native parentage was 3.4, among native whites of foreign or mixed parentage 1.2, among foreign-born whites 10.1, and among negroes 17.4. The improved condition of the colored population as regards illiteracy is particularly encouraging. In 1890, 41.7 per cent of the colored population was illiterate. According to the thirteenth census the total school population, ages 6 to 20 years, in 1910 was 993,998. Of these, 646,868 attended school in that year. The total school population of native parentage was 798,833, and the negro school population was 41,682. According to the report of the State Superintendent of Education the total school population in 1913 was 954,699, the total enrollment 690,484, and the average daily attendance 494,309. Female teachers numbered 14,148 and male 4706. The average salary of male teachers was \$497.60 per year and of female teachers \$484.44. On June 1, 1914, there were 165 first-class high schools, 55 second-class, and 141 third-class, making a total of 361 approved schools.

The General Assembly of 1909 provided county supervision of schools and a compulsory eight months' term in each school district. In 1911 a

teachers' certificate law was passed and provisions made for the transportation of pupils.

Agriculture is taught in the high schools. The total enrollment in the high schools in 1913 was 42,266. The average length of the school term in 1913 was 160 days. The estimated value of the school property for sites and buildings was \$41,829,767 and for school equipment \$3,605,681. The total expenditure for educational purposes in 1913 was \$16,402,780. There are normal schools at Cape Girardeau, Kirksville, Warrensburg, Springfield, and Maryville. Washington University is at St. Louis, the University of Missouri at Columbia, Missouri Wesleyan College at Cameron, Christian University at Canton, Central College at Fayette, Pritchett College at Glasgow, Missouri Valley College at Marshall, Scarritt-Morrisville College at Morrisville, Park College at Parkville, Drury College at Springfield, Tarkio College at Tarkio, and Central Wesleyan College at Warrenton. These are all coeducational. Colleges for men exclusively are Westminster College at Fulton, William Jewell College at Liberty, St. Louis University at St. Louis, and Christian Brothers College at St. Louis. The last two are Roman Catholic institutions. Colleges for women are Stephens College at Columbia, Howard-Payne College at Fayette, Synodical College at Fulton, Central College for Women at Lexington, Lexington College for Young Women at Lexington, Hardin College at Mexico, Cottey College at Nevada, Lindenwood Female College at St. Charles, and Forest Park University at St. Louis. Special schools include the State School for the Deaf at Fulton, Missouri School for the Blind at St. Louis, Missouri Training School for Boys at Boonville, and Missouri Training School for Girls at Chillicothe.

Charities and Corrections. The charitable and correctional institutions are under the control of the State Board of Charities and Corrections. This board, in addition to its other duties, serves as a bureau of information for those seeking knowledge of social questions. It employs a secretary, who devotes all his time to the study of social work and acts as an official agent for the board. The charitable and correctional institutions under the supervision of this board include hospitals at Fulton, St. Joseph, Nevada, and Farmington, the Industrial School for Girls at Chillicothe, Training School for Boys at Boonville, Colony for Feeble-Minded and Epileptic at Marshall, Missouri School for the Deaf at Fulton, Missouri School for the Blind at St. Louis, Federal Soldiers Home at St. James, Confederate Soldiers Home at Higginsville, State Sanatorium at Mount Vernon, and State Penitentiary at Jefferson City. Prior to 1911 convicts were employed under contract, although their work was confined to the prisons. In some of the counties male prisoners within the county jails were worked on the public roads or at quarrying stone. In the year mentioned a measure was passed forbidding the farming out or selling of convict labor. Convicts are allowed to work in the binding-twine plant and in manufacturing supplies for State institutions. These cannot be purchased elsewhere if they can be supplied by convict labor. The same Legislature passed a measure permitting counties with a population of 250,000 to 500,000 which have a juvenile court to appropriate not more than \$12,000 a year for the support of mothers of children under 14, who are widows or whose

husbands are prisoners and who would otherwise have to work away from their children. The only city to which this applies is Kansas City. Cities of 500,000 or more inhabitants are permitted to create a board of children's guardians to manage public institutions of the city for delinquent, dependent, or defective children. In counties with a population of 50,000 or more juvenile courts for children under 17 are established.

Religion. The two leading denominations, the Methodist and the Baptist, are of almost equal strength. The Roman Catholics also have a strong representation. Probably the most rapidly developing denomination is that of the Disciples of Christ. It ranks third among Protestant denominations. The largest of the remaining denominations are the Presbyterians, Lutherans, Protestant Episcopalians, and Congregationalists.

History. Missouri was part of the vast area of Louisiana claimed by the French on the ground of the discoveries of La Salle, who descended the Mississippi to its mouth in 1681-82. A few years before La Salle, in 1673, Marquette and Joliet had sailed down the river as far as the mouth of the Arkansas. The territory included within the present State was traversed before 1720 by parties of French explorers in search of mines of lead and silver, and in 1723 a certain Lieutenant Renaud received the grant of a large tract of land in that region. The foundation of St. Genevieve is sometimes placed in the year 1735. The second settlement within the State was St. Louis, established as a trading post in 1764, a year after the cession of Louisiana to Spain by the Peace of Paris. Many French residents removed from the villages east of the Mississippi to St. Louis, which became, under the French and the Spanish, a prosperous little capital. The colonization of the region was greatly accelerated by the Ordinance of 1787, which, in excluding slavery from the Northwest Territory, diverted the stream of southern immigration to Missouri. The Spaniards also encouraged immigration by the offer of liberal bounties to settlers. In 1800 Louisiana was retroceded to France, which, however, retained it only three years. After the acquisition of Louisiana by the United States, in 1803, the entire territory was divided in two by the line of the thirty-third parallel of latitude, the northern part being known as the District and Territory of Louisiana till 1812, and subsequently as the Territory of Missouri. At that time the population was over 20,000, and the chief occupations of the inhabitants were agriculture, fur trading, and mining. The mass of the people were sturdy and unrefined; the rough backwoodsman and the fighting Mississippi River boatman were picturesque types of the society of the period. After 1815 immigration increased markedly. In 1820 there were 66,000 inhabitants within the present limits of the State, of whom about 10,000 were slaves. The Indian titles to the land were extinguished rapidly. Between 1800 and 1824 the Osages and Sacs and Foxes ceded almost all their lands, though it was not till 1837 that the area of the State was rounded out by the so-called Platte Purchase.

In 1817 the Territorial Legislature applied to Congress for permission to prepare a State constitution. (For the struggle in Congress concerning Missouri, see UNITED STATES and

MISSOURI COMPROMISE.) In June, 1820, a convention framed a constitution which sanctioned slavery and forbade any free negro or mulatto to take up his residence in the State; but Missouri was admitted (Aug. 10, 1821) only after the Legislature had taken a pledge that the antirefreedmen clause should never be enforced. The period after 1820 was one of rapid, if not entirely sound, development. An era of wild speculation in lands set in, accompanied by the usual inflation of the currency (the Bank of St. Louis had been established in 1816) and the inception of an elaborate system of internal improvements. Within 20 years after 1835 the State pledged its credit for \$28,000,000 to various railroad companies and found itself saddled with a debt of over \$20,000,000. The system of public education was quite inefficient before the Civil War, though St. Louis University had been incorporated in 1832 and the State University at Columbia eight years later. Respect for the law was often sadly wanting in the western part of the State, as was shown in the history of the Mormons. They had settled at Independence in Jackson County and had made the beginning of a prosperous community, when they were driven out by mob violence, for which it is probable they were less responsible than their enemies. They established themselves anew in Caldwell County; but there, too, they came into conflict with the authorities and the inhabitants, who forced them to depart once more in a destitute condition, leaving valuable farms and other property behind them. See MORMONS.

In the first half of the nineteenth century Missouri, though a slave State, was not an ardent defender of slavery, and a very large proportion of its citizens were interested in movements looking towards the gradual emancipation of the slaves. With the rise of the Abolitionists, however, Missouri became decidedly a proslavery State. It favored the annexation of Texas in 1845 and took a very prominent share in the Mexican War, General Kearny's army of invasion consisting largely of Missourians. In 1849 the Legislature adopted the so-called Jackson resolutions, in which the right of Congress to regulate slavery in the Territories was trenchantly denied, and the principle of squatter sovereignty was asserted. The Jackson resolutions, however, did not represent the unanimous feeling in the State when they covertly threatened secession. In the election of 1860 the vote in the State for Douglas and for Bell was nearly equal, while Breckenridge and Lincoln received a far smaller vote than the others. The Legislature thereupon issued a call for a convention to consider the relation of the State to the Union. In the elections for the convention the secessionist delegates were defeated by a popular majority of 80,000, and when the convention met—February to April, 1861—it declared that it could find no cause to dissolve the connection between the State and the Federal Union, and expressed the hope that some compromise might be effected between the North and the South. In reply to President Lincoln's call for troops, Governor Jackson, who, with the rest of the State government, was in favor of secession, refused to participate in the "unholy crusade" and summoned the State militia to arms. Between the State militia and the Federal troops, under Colonel Lyon, aided by the volunteer

bands which the loyalists of St. Louis had organized, civil war ensued. The Governor, together with a majority of the Legislature, fled to the southern part of the State, and the supreme power was assumed by the convention which declared all the offices vacant and proceeded to install a provisional government. The fugitive Legislature responded by declaring Missouri a member of the Southern Confederacy. (For military operations in Missouri, see CIVIL WAR IN AMERICA.) In 1863 the convention passed an ordinance of emancipation of doubtful legality, to go into effect in 1870. With the fall of the Confederate power in Missouri the regular State government was reorganized (1864), and in January, 1865, a constitutional convention controlled by the radical union party assembled in St. Louis. The new constitution provided for the immediate emancipation of the slaves and imposed severe political disabilities on all who had participated in the Rebellion; all teachers, physicians, lawyers, and ministers were required to take a searching oath of loyalty. The qualifications for the franchise deprived a vast proportion of the citizens of the right to vote and continued in force till 1871, when a more liberal registration law was adopted. A third constitution went into effect in 1875.

From 1824 to the Civil War Missouri was always Democratic. From 1864 to 1872 the Republicans were in power, but the defection of a large body of Liberal Republicans who were opposed to the policy pursued against those who had participated in the Rebellion led to the reestablishment of Democratic supremacy. In 1894, however, the Republicans secured a majority in the Legislature and the congressional delegation. In 1904 Roosevelt carried the State. In 1905 Joseph W. Folk (Democrat), who had become a national figure, from his successful exposure and conviction of corrupt city officials in St. Louis, was elected Governor, although in the same year the Republican national ticket carried the State by 25,000 plurality. The Legislature of 1907 passed many severe measures for the regulation of railroads and corporations; these resulted in much litigation in the succeeding years. (See RAILWAYS and STATE RIGHTS.) In 1908, as a result of a suit brought by Attorney-General Herbert S. Hadley, the Standard Oil Company of Indiana and the Republic Oil Company of New York were forbidden to do business in the State. In the elections of that year Mr. Hadley defeated the Democratic candidate, William H. Cowherd, for Governor, and William J. Stone was nominated for the United States Senate. The carrying of the State by the Republicans in the presidential election was one of the surprises of the campaign of 1908. Taft received 347,202 votes, Bryan 246,574. In January, 1909, the United States Supreme Court upheld the decision of the State courts against the Standard Oil Company of Indiana and its subsidiary companies. Missouri took a conspicuous part in the political campaign of 1912. The leading candidate for the Democratic nomination put at the head of the national convention was Champ Clark, one of the State's Representatives in Congress and Speaker of the House. Governor Hadley was one of the foremost Progressive leaders in the Republican pre-convention campaign and was one of the seven governors who signed a letter urging Mr. Roosevelt to be a candidate during

the first days of the convention. He was leader of the Republican forces. With the nomination of Mr. Taft, however, Governor Hadley did not join the movement for a new party, but gave his support to President Taft. At the election on November 5, Wilson received 339,497 votes, Taft 207,491, and Roosevelt 123,111. Elliott W. Major, Democrat, was elected Governor. A senatorial election was held in 1914 in which Senator Stone was reelected. The most notable feature of this election was the falling off of the Progressive vote, which was reduced from 327,371 in 1912 to 27,614 in 1914. The following is a list of the Governors of the State:

Alexander McNair.....	Democrat.....	1820-24
Frederick Bates.....	".....	1824-25
Abraham J. Williams (acting).....	".....	1825

MISSOURI, mī-sŭ'ri or mī-zŭ'ri. A small tribe of Siouan stock. When first known to the whites they occupied the territory about Grand River, a northern affluent of the Missouri, in what is now the State of Missouri, and contiguous to the Iowa and Oto (q.v.) on the north and west, all three tribes speaking the same language. Their popular name is of Algonquian origin, and is said to mean "great muddy," referring to the Missouri River. They call themselves *Niutachi* or *Nudacha*, "those who come to the mouth" (of the river). The Missouri are named upon Marquette's map of 1673, and some years afterward a French fort was established in their territory. In 1725 a number of their

chiefs visited France and attracted much attention. At one time in the eighteenth century they were estimated at from 1000 to 1200; but, after being greatly reduced by smallpox, they were attacked by the Sauk, who compelled them to abandon their territory about 1798 and take refuge west of the Missouri. In 1805 they were living near the mouth of the Platte River and numbered about 300. In 1823 they were again so decimated by smallpox that the remnant, about 80 persons, incorporated with the kindred Oto.

MISSOURI, UNIVERSITY OF. A State institution for higher education, founded in 1839 at Columbia, Mo. It is coeducational. The university in 1915 was organized into 11 divisions: the colleges of arts and sciences, and agriculture, including an experiment station; schools of commerce, education, engineering, including an experiment station, journalism, law, medicine, mines and metallurgy; graduate school, and the extension division. The school of journalism was founded in 1906 and the school of commerce in 1914. These divisions, with the exception of the school of mines and metallurgy, which is located at Rolla, are at Columbia. For admission to the division of arts and agriculture four years' high-school work is required, while for admission to professional schools there are required two years of college work or its equivalent. The master's degree is conferred in the graduate school and the bachelor's degrees in the colleges of arts and sciences and agriculture, schools of commerce, education, journalism, law, and mines and metallurgy; the degrees of M.E. in mines and metallurgy, and C.E., E.E., M.E., and Ch.E. in engineering. The honorary degree of doctor of laws is also conferred. The enrollment in all the departments in 1914-15 was 3816. This includes the enrollment in the summer schools. The faculty numbered 186, including 84 assistants. The campus at Columbia contained about 70 acres, and the university owns a farm containing nearly 800 acres. The campus at Rolla contains 27 acres. The total value of the grounds, buildings, and equipment at the end of the collegiate year 1913-14 was \$3,646,010. The endowment was \$1,505,339. The university is supported largely by State and Federal appropriations. The library contains nearly 200,000 volumes and 100,000 pamphlets. The president in 1915 was Albert R. Hill, LL.D.

MISSOURI COMPROMISE. In American history, an arrangement between the free and slave States, embodied chiefly in an Act of Congress approved March 6, 1820, which provided for the admission of the State of Missouri into the Union with a constitution which allowed slavery, but which forever prohibited slavery in all the rest of the Louisiana territory lying north of lat. 36° 30' N., that being the southern boundary line of Missouri. To balance the admission of Missouri as a slave State, Maine was admitted as a free State at the same time. In February, 1819, in the debate in Congress on the bill to admit Missouri into the Union, James W. Tallmadge, of New York, moved to amend the Missouri bill to the effect "that the further introduction of slavery or involuntary servitude be prohibited, and that all children of slaves born within the State after the admission thereof in the Union shall be free at the age of 25." The admission of Alabama in the same year without any prohibition against slavery made

the number of "slave" States and of "free" States equal. The admission of Missouri as a "free" State, therefore, would disturb the equilibrium. The bill with the Tallmadge amendment passed the House Feb. 7, 1819, by a vote of 87 to 76. On March 2 the Senate passed the bill without the Tallmadge amendment. Two days later Congress adjourned and the question of Missouri went over to the next session. In December, 1819, another bill for the admission of Missouri was introduced, whereupon John W. Taylor, of New York, on Jan. 26, 1820, offered an amendment in the House which provided that as a condition of admission the State should be required to adopt a constitution forever prohibiting slavery within its limits. This gave rise to a prolonged and vigorous debate on the power of Congress to impose conditions upon the admission of a State into the Union. Those who upheld the power of Congress in the premises based their argument on the provision of the Constitution which empowers Congress to admit new States, the implication being that it may admit under any conditions which it may see fit to impose. Their opponents relied chiefly upon the doctrine of the equality of the States in the Federal system, and declared that Congress had no constitutional power to destroy that equality by attaching onerous conditions to admission of the new States. Meantime the situation was complicated by the application of Maine to be admitted with a constitution prohibiting slavery. The House of Representatives promptly passed a bill for this purpose, and when this bill came up for discussion in the Senate in January, 1820, the friends of slavery in Missouri, who were in a majority in the Senate, coupled the Maine bill with the bill to admit Missouri with slavery, and the Senate steadily refused to disconnect the two measures. In this situation the substance of the compromise was proposed by Senator Thomas, of Illinois, in an amendment which provided that Missouri should be admitted with a constitution allowing slavery, but that in all the rest of the Louisiana territory north of lat. 36° 30' N. slavery or involuntary servitude should be forever prohibited. The bill with this amendment finally passed the Senate, Feb. 18, 1820, by a vote of 34 to 10. The bill thus amended was coupled with the bill to admit Maine, and in this shape was sent to the House for concurrence. The House refused to agree to the combination, and the matter was then referred to a conference committee of the two Houses, which recommended that the Maine bill be passed separately, and that the Missouri bill should be passed with the Thomas amendment. To this report the House agreed. The separation of bills as distinct subjects was thus secured, and recognition was given to the claim of the Southerners that Congress had no power to impose such limitations as it saw fit upon any State as a condition of its admission to the Union. President Monroe approved the Maine bill on March 3, and the Missouri bill on March 6, 1820. Henry Clay, who was Speaker of the House, exerted his influence to bring about this result, and for his work in these compromises was called the "Pacifator." In the next session the constitution of Missouri, including a paragraph making it the duty of the Legislature to prevent the immigration of free negroes into the State, was presented to Congress for approval. This provoked a heated debate concern-

ing the duty of the Federal government to protect the citizens of each State in the exercise of their civil rights of citizenship in every other State. After protracted negotiation, a bill was finally introduced providing that Missouri should be considered admitted as a State only after its Legislature had declared that no law would ever be passed, nor any construction placed upon the obnoxious paragraph which would justify any law which might abridge within Missouri the rights guaranteed to all citizens by the Federal Constitution. The bill involving this second compromise was approved March 2, 1821, and in accordance with its terms Missouri became a Commonwealth. The compromise of 1820 was important as the first precedent for the congressional exclusion of slavery from public territory, and also as a clear recognition that Congress had no right to impose upon a State asking for admission into the Union conditions which do not apply to those States already in the Union. "The Missouri Compromise was the work of moderate men, chiefly those who lived in the Middle States and in the northern tier of Southern States." The Missouri Compromise was specifically repealed by the Kansas-Nebraska Bill of 1854, and was pronounced unconstitutional and void by the famous Dred Scott decision.

MISSOURI RIVER. The principal affluent of the Mississippi and the longest river of the United States (Map: United States, G 2). It is formed in southwest Montana by the confluence of the Jefferson, Madison, and Gallatin rivers, which unite at Gallatin City, Mont., at an elevation of 4032 feet above sea level. The longest branch, the Jefferson, has its farthest source in Red Rock Creek, which rises on the slopes of the Red Rock Range of the Rocky Mountains, on the border between Montana and Idaho, west of the central portion of Yellowstone Park. The Madison and Gallatin rivers rise within the Yellowstone Park near the source of the Yellowstone River. From the junction of the three forks the Missouri flows north and east across Montana into North Dakota. Here it is joined by its largest affluent, the Yellowstone River, which at the point it empties into the Missouri is about 800 yards wide. From this place the Missouri describes a long curve towards the southeast and then crosses the whole width of South Dakota. After reaching the Nebraska boundary it divides this State from Iowa and Missouri, forms the northeast boundary of Kansas, and finally takes an easterly course across Missouri, joining the Mississippi River 3 miles below Alton, Ill., and 20 miles above St. Louis. Its length to the source of the Jefferson is about 2950 miles and to the source of the Madison about 2910 miles. With the lower Mississippi the river has a total length

of about 4200 miles, which is equaled by no other river in the world. The Missouri is a swift and turbid stream, navigable only by flat-bottomed steamboats. In the flood period in early summer it can be ascended nearly to Great Falls, Mont., about 2300 miles from the mouth, but during low water, which occurs in summer and early autumn, navigation is suspended above the junction of the Yellowstone. At Great Falls the Missouri passes over a series of cataracts, descending a vertical distance of 350 feet in 16 miles. The highest falls are 87 feet. About 145 miles above this point is the Gate of the Rocky Mountains, a narrow rock gorge 5 miles in length, whose perpendicular walls rise 1200 feet above the river. The lower course of the Missouri, lying within the great plains, has been graded so as to offer no interruptions. In this part it is often a mile or more wide. The chief tributaries are the Milk and Yellowstone, in Montana; Little Missouri, in North Dakota; Cheyenne, James, White, and Big Sioux, in South Dakota; Niobrara and Platte, in Nebraska; Kansas and Osage, in Kansas and Missouri. It drains the greater part of the territory between the Mississippi and the summits of the Rocky Mountains. The Arkansas and Red rivers are the only other large streams in this region that contribute their waters directly to the Mississippi. The area of the basin drained by the Missouri is about 600,000 square miles, and the average quantity of water discharged by the Missouri in a second is about 120,000 cubic feet. A number of thriving cities are located on the Missouri, including Kansas City, Leavenworth, Atchison, Omaha, Sioux City, Pierre, Bismarck, and Great Falls, the last being the centre of a great copper-smelting industry which utilizes the power of the falls.

MISSOURI SUCKER, or **GOURDSEED**. See **BLACK HORSE**, and **Plate of SUCKERS**.

MISSOURI VALLEY. A city in Harrison Co., Iowa, 21 miles north of Council Bluffs, on the Chicago and Northwestern Railroad (Map: Iowa, B 3). It has a Carnegie library, and the fair grounds of the county agricultural society. The industrial interests are represented by extensive railroad machine shops, stockyards, grain elevators, and manufactories of flour, machine-shop products, bricks, tiles, cement blocks, and creamery products. Fruit growing and stock raising are carried on in the vicinity. The water works are owned and operated by the municipality. Pop., 1900, 4010; 1910, 3187.

MIST. See **FOG**; **HAZE**.

MISTAKE. In law, an erroneous mental conception affecting the will or intention and hence leading to an unintended act or preventing a contemplated result. The importance of the mistake in legal contemplation is its effect upon the act. In general a mistake of law produces no legal effect upon an act influenced or induced by it. Thus, one is without remedy who has entered into a contract without knowing or understanding its legal effect, or who has voluntarily and with full knowledge of the facts paid a claim not well founded in law. The full acceptance of the doctrine is due to a misapplication of the maxim, *Ignorantia juris non excusat* (Ignorance of the law is no excuse), which is applicable only in the criminal law or under statutes imposing quasi-criminal penalties where sound policy requires that ignorance of law should not excuse one charged with a crime. (See **INTENT**.) Mistake of fact has a direct

legal effect on many acts, and the law in many cases affords a remedy to one who has done a prejudicial act induced by mistake of fact.

The effect of mutual mistake as to a material term of a contract is to prevent the meeting of the minds and thus prevent the formation of a contract (q.v.). The effect of mutual mistake of fact in case of sale is to prevent passing of title, and one who has given up the possession of personal property under mistake, preventing the passing of title, may recover the specific property by an appropriate action, or its value in an action of trover. In general, whenever money or property is delivered to another under material mistake of fact, its value may be recovered in an action based on the theory of quasi contract (q.v.).

In the law of tort the effect of mistake of fact varies considerably with the different branches of the subject. In the law of trespass one is required to know his own, and he interferes with the property of another at his peril.

Equity has jurisdiction to relieve one from the consequences of his mistake of fact, by compelling a re-formation or rescission of a contract.

Consult Kerr, *A Treatise on the Law of Fraud and Mistake* (3d ed., London, 1902).

MISTASSINI, mis'tās-sē'nē. A large lake near the north boundary of the Province of Quebec, lat. 50° N., long. 72° to 74° W. (Map: Canada, Q 6). In 1672 French Jesuit missionaries visited it. The Indians claimed an extravagant length for the lake, saying that three days were employed in crossing the narrowest part from island to island, but an estimate based on surveys gives the length at 120 miles and the actual width at 20 miles in the widest parts. From the northeast and southeast it receives the drainage of a chain of smaller lakes, and discharges its own surplus into James Bay, the southern arm of Hudson Bay, by the Rupert River, 120 miles long. The Hudson's Bay Company has a post on Lake Mistassini, 333 miles north of Montreal. The lake is of great depth and abounds in fish; the surrounding country is level and well fitted for agriculture, while the woods are full of game. The winters are clear and cold and the summers warm and short.

MISTEC. See **MIXTEC**.

MISTELI, mis-tā'le, FRANZ JOSEF (1841-1903). A Swiss philologist. He was born at Solothurn; studied at Zurich and Bonn; taught at Saint-Gall and Solothurn; and in 1874 became professor of comparative linguistics at Basel. A follower of Steinthal, whose *Charakteristik der hauptsächlichsten Typen des Sprachbaues* he re-edited in 1893, Misteli contributed to Kuhn's *Zeitschrift* and to the *Zeitschrift für Völkerpsychologie*, and wrote *Ueber griechische Betonung* (1875) and *Erläuterungen zur allgemeinen Theorie der griechischen Betonung* (1875). He was an authority on the dialects of the Ural and Altai.

MISTLE (mis'l) **THRUSH**, or **MISSEL THRUSH**. One of the most familiar and admired of European thrushes (*Turdus viscivorus*), named from its fondness for mistletoe berries, which are rejected by the majority of small birds. It is the largest and one of the most numerous of British thrushes, and is also well known throughout the Mediterranean region and western and northern Asia. Everywhere it is migratory, and is noted for its loud and pleasant song, which begins first of all bird notes in the spring and lasts far into the sum-

mer; its habit of cheerfully singing on cold or rainy days, when most other birds are quiet, has given it the sobriquet "stormcock." Its plumage is soft grayish brown above and white below, the breast and abdomen thickly and sharply spotted. See THRUSH.

MISTLETOE, mis'tl-tō (AS. *misteltān*, *mistiltān*, Icel. *mistilteinm*, from AS. *mistel*, birdlime, mistletoe, basil, Icel., OHG. *mistil*, Ger. *Mistel*, mistletoe + AS. *tān*, twig). A genus (*Viscum*) of small shrubs of the family Loranthaceæ. This family contains more than 500 known species, mostly tropical and parasitic. The leaves are entire, almost nerveless, thick, fleshy, and without stipules. The flowers of many species are showy. The European mistletoe (*Viscum album*), a native of the greater part of Europe, grows on many kinds of trees, particu-

VISCUM ALBUM.

larly on the apple, and its close relatives, the service and hawthorn; sometimes, also, on sycamores, limes, poplars, locust trees, and firs, but rarely on oaks (contrary to the common belief). It is very plentiful in some parts of the south of England, its evergreen leaves giving a peculiar appearance to the orchards in winter, when the clusters of mistletoe are very conspicuous among the naked branches of the trees. The stems divide by forking; the leaves are opposite, of a yellowish-green color, obovate-lanceolate, obtuse. The flowers are inconspicuous, and grow in small heads at the ends and in the divisions of the branches, the male and female flowers on separate plants. The berries are about the size of currants, white, translucent, and full of a very viscid juice, which serves to attach the seeds to branches, where they germinate, and take root, the radicle always turning towards the branch, whether on its upper or under side. The mistletoe derives its nourishment only partly from the juices of the tree on which it grows, and from which it seems to spring as if it were one of its own branches. The green coloring matter, chlorophyll, permits the parasite to elaborate its food. The mistletoe was intimately connected with many of the superstitions of the ancient Germans and the British Druids. In the northern mythology, Balder is said to have been slain with a spear of mistletoe. Among the Celts the mistletoe which grew on the oak was in peculiar esteem for magical virtues. Traces of the ancient regard for the mistletoe still remain in some old English and German customs, as kissing under the mistletoe at Christmas. The

mistletoe was at one time in high repute as a remedy for epilepsy and convulsions, but it seems to possess no decided medicinal properties. *Loranthus europæus*, a shrub very similar to the mistletoe, but with flowers in racemes, is plentiful in some parts of the south of Europe, and very frequently grows on oaks. *Loranthus odoratus*, a Nepalese species, has very fragrant flowers. In the United States the mistletoe is *Phoradendron*, a genus of plants closely allied to and greatly resembling *Viscum*. The common species in the Eastern States is *Phoradendron flavescens*. It occurs upon various species of hardwood trees from New Jersey to Missouri and southward and is used for Christmas decorations like the European one. In the southwestern part of the United States and in California are still other species. *Arceuthobium pusillum*, or *Razoumofskyia pusilla* is a leafless mistletoe about an inch long, parasitic on spruce and tamarack trees from Maine to Michigan. A larger species of the same genus grows in the Northwest. See Colored Plate of PARASITIC PLANTS.

MISTLETOE BOUGH, THE. A pathetic song by Thomas Haynes Bayly, based on a legend connected with various localities.

MISTRAL, mé'stral', or **MAESTRAL**, má'stral' (Prov., master wind). The Provençal name for the cold northwest wind on the southern coast of France and in other parts of the Mediterranean coast region. This wind is identical in origin with the bora (q.v.) of the Caspian Sea and of Austria, Turkey, and southern Russia. It is also perfectly analogous to the strong northwest winds of the United States. In both cases the atmosphere over a great extent of country is circulating about a region of low pressure or a so-called storm centre, moving along over the surface of the earth usually towards the east or northeast. When such a storm centre passes over southern Europe, the cold winds from Russia sweep southward with great force towards it. The warm southerly siroccos give place to cold northerly boras and mistrals, which are very dry; the cloudy hazy skies are replaced by cloudless transparent air. During the first few hours the wind seems to come in descending and violent gusts; afterward it becomes more moderate, but is still very strong. When it descends over mountain slopes upon the water, as it does along the coast of France, Italy, and Austria, it makes navigation difficult and even dangerous to small craft.

MISTRAL, FRÉDÉRIC (1830-1914). A French poet, the leader of the modern Provençal revival in southern France. He was born at Maillane, Bouches-du-Rhône, Sept. 8, 1830, and went to school in Avignon. Here he came under the influence of Joseph Roumanille (q.v.), who had already conceived the idea of raising the native speech to higher uses. Roumanille's Provençal poem *Li Margarideto* fired the youth's enthusiasm, and when he returned to Maillane, at the end of his school days, he wrote a poem in four cantos, *Li Meissoun*, the best parts of which he has preserved by insertion into his riper works. His father, seeing his intellectual superiority, had him study law at Aix. Mistral, however, did not practice law, but gave himself up heart and soul to the work of creating a literature in Provençal. With six friends he founded the society of the Félibres in 1854 and contributed to their annual organ *L'Armana Prouvençau*. The publication in 1859 of *Mirèio* is the most important

event in Mistral's life and in the history of the movement. It was a revelation to the *Félibres*, and through the enthusiastic praise of Lamartine it obtained a national success. *Mirèio* is a narrative pastoral poem in twelve cantos, a wonderful expression of what is most characteristic and best in the rural life of Provence. The language is the dialect of Saint-Remy, raised to the dignity of a literary language by a process of purification and enrichment strictly in accord with its genius. At this time also Mistral published some of his best lyrical poems, notably one called *The Countess*, a vigorous protest against the centralization prevailing in France. In 1867 he published a second long poem, *Calendau* (French, *Calendal*); it treats of mediæval legends and traditions, and abounds in symbolism. In 1875 appeared his only volume of lyrics, *Lis Isclo d'or*. In 1876 the *Félibrige* (q.v.) was formally organized into a great association with Mistral as *Capoulié* or chief. He next published *Nerto*, a fantastical tale in verse. Later he brought out his monumental dictionary of all the dialects of the *Langue d'oc*, *Lou tresor dou Félibrige*. In 1890 appeared *La Rèino Jano* (Queen Joanna), which he called a Provençal tragedy. It is brilliant in language, but of little dramatic power. In the same year he founded the quarterly *L'Aidi*. In 1897 appeared a third long narrative poem, *Lou pouèmo dou rose*, his best work after *Mirèio*. It is a felicitous combination of fanciful legends and realism. In 1904, with Echegaray, Mistral was awarded the Nobel prize for literature. He published in 1906 *Mes origines, mémoires et récits*, in 1910 he made a Provençal translation of Genesis, *La Genèsi traducho en provençal*, and in 1913 appeared his *Olivado*, a collection of lyric poetry written at different times in his life. The best English translation of *Mirèio* is that of Harriet Preston (Boston, 1872); it appears also in Warner's *Library of the World's Best Literature*. There are prose translations in French by Mistral of all his works. He died March 25, 1914. Consult: Gaston Paris, *Penseurs et poètes* (Paris, 1896); Welter, *Frédéric Mistral, der Dichter der Provence* (Marburg, 1899); C. A. Downer, *Frédéric Mistral, Poet and Leader in Provence* (New York, 1901); *Memoirs of Mistral*, rendered into English by C. E. Maud: Lyrics from the Provençal by Alma Strettel (London, 1907).

MISTRETTA, mè-strèt'tà. A town in the Province of Messina, Sicily, 50 miles northwest of Catania (Map: Italy, E 6). It is situated in one of the most fertile sections of the island, 3200 feet above the sea and but a short distance from it. The chief industries are farming and cattle raising. Lignite is mined in the vicinity. Pop. (commune), 1901, 13,481; 1911, 13,608.

MISTRI'AL. In law, an invalid or illegal trial of an action, the result of which is without legal effect on the cause of action, and which leaves the parties in the same position as if there had been no trial of the case. A mistrial may result from a variety of causes, as a defective plea, the failure of the parties to form a triable issue, the incompetence of the judge to act in a given case, the drawing of a jury from the wrong county, the withdrawal or death of a juror, or any other event which affects the legal validity of the proceedings. Where the prosecution of a person charged with a crime results in a mistrial the accused may be again tried, and cannot plead the constitutional defense that he has been twice in jeopardy, as that plea is valid

only where the proceedings are legal and the issue is tried to a conclusion. See **NONSUIT**; **TRIAL**.

MITANI, mè-tā'ně. See **AMARNA LETTERS**; **CUNEIFORM INSCRIPTIONS**.

MITANNIANS. The name of a people living in Mesopotamia in the second millennium B.C. Our knowledge concerning them is derived chiefly from the Tel el Amarna and Boghaz Keui tablets. The Mitannians seem to have belonged to the Hittites in the wider sense of this term, but were apparently distinct from the Hatti, or Hittites, whose capital was at Boghaz Keui in the days of Subbiluliuma and his successors. (See **HITTITES**.) Among the leading kings of the Mitannians who are known to us were Saushshatar, Artatama I, Sutarna I, Tushratta, Artatama II, Artashshumara, Mattuaza, and Sutarna II. Tushratta was a contemporary of Subbiluliuma, and father-in-law of Amenhotep III of Egypt (1411-1389 B.C.). His three predecessors consequently reigned during the fifteenth century. This dynasty, however, does not seem to have belonged to the native Mitannian race, but to the Harri, an Aryan people, as their worship of Mitra, Varuna, Indra, and the Nashatya indicates. Winckler has suggested that these Harri first took possession of Armenia and then imposed their authority on the Mitannians. The Mitannians themselves may have been the Hittites (Hatti) who in 1932 B.C. made an end to the Amoritic dynasty of Babylon. (See **BABYLONIA**.) In the weakness of Assyria following Samsi Adad II (c.1870-1840) they established themselves in Mesopotamia, and the new dynasty of the Harri was able to take possession of Assyria itself, or at any rate the territory around Nineveh, so that Tushratta could send Ishtar of Nineveh to Amenhotep III in his last illness. It was evidently by an alliance with Egypt that Tushratta was able to maintain his independence of the great King of Hatti, while it is not improbable that another independent Harrian kingdom existed north of his realm adjoining the Arzawa in Armenia. As to the ethnic relations of the native Mitannians, their language seems to point to a kinship, not only with the Hittites in Asia Minor, but also with other Asianic and Caucasian peoples. Among the letters of Tushratta in the Tel el Amarna collection one is written in the Mitannian language, though in cuneiform characters. It is a square tablet whose longest side is 3 feet in length, containing two columns of text on each side, each of which has 100 lines. This letter is now in Berlin, and it was first published by Winckler in *Mitteilungen aus den k. Museen zu Berlin* (Berlin, 1890). Attempts at interpreting it were made by Brünnow, Sayce, Jensen, and Messerschmidt, but the most exhaustive study of its language has been made by Bork, who compares it throughout with the Georgian, Mingrelian, and other Caucasian tongues, and also with the Chaldian (see **CHALDIANS**) and the Elamitic (see **ELAM**), finding no similarities between it and the Aryan, Semitic, or Uralo-Altaic languages. It has been plausibly conjectured that the name Mitani occurs in the bilingual inscription on the so-called Tarkondemos boss, showing that both Hittite hieroglyphics and cuneiform script were used among the Mitannians. In the religion of this people Teshub, Nergal as sun god, and Ishara, corresponding to Ishtar, seem to have been the chief deities. Aryan divinities, possibly at that time

Iranian, were introduced by the Harri; and the worship of Akkadian, Assyrian, and Amoritic gods no doubt flourished among the Mitannians.

Bibliography. The editions of the Tel el Amarna tablets by Winckler and Knudtzon; Brünnow, Sayce, and Jensen in *Zeitschrift für Assyriologie* (Leipzig, 1890-91); Messerschmidt, "Hettiter," in *Der alte Orient* (ib., 1903); Ferdinand Bork, "Mitanninamen aus Nippur," in *Orientalistische Literatur-Zeitung* (Berlin, 1906); Winckler, in *Mitteilungen der deutschen Orientgesellschaft* (ib., 1907); M. A. S. Oppenheim, "Der Tell Halaf und die verschleierte Göttin," in *Der alte Orient* (Leipzig, 1908); Ferdinand Bork, *Die Mitannischsprache* (Berlin, 1909); Winckler, *Vorderasien im zweiten Jahrtausend* (Leipzig, 1913).

MITAU, mě'tou. The capital of the Government of Courland, Russia, situated in a flat and fertile district on the left bank of the navigable Sengaller Aa, 25 miles southwest of Riga (Map: Russia, B 3). It has an immense palace erected by Biron in 1738 on the site of an older ducal palace, used as a government building. Two Gymnasias, a provincial museum with a library, and a theatre are the principal educational establishments of the town. The industries of Mitau are unimportant; the chief manufactures are flour, chocolate, oilcloth, ink, and iron products. The trade in grain and lumber is rather extensive. Pop., 1897, 35,011; 1913, 39,200, consisting of Germans (95,000), Jews (6500), Letts (6000), Russians, and Poles. The majority of the inhabitants are Protestants, and the town is the seat of a General Superintendent of the Lutheran church. The castle of Mitau was founded by the Knights Sword Bearers in the second half of the thirteenth century, and became a city in 1435. In 1561 it became the capital of the Duchy of Courland and in 1795 it was annexed to Russia. In 1812 it was occupied by the French and Prussians.

MITCH'AM. An important railway junction and suburb of London, England, on the river Wandle, in Surrey, 4 miles northwest of Croydon (Map: London, G 6). It is noted for its extensive gardens, the soil of which is especially adapted for the cultivation of roses, lavender, peppermint, and other medicinal herbs, from which an excellent quality of essential oil is extracted. Mitcham Common, covering 480 acres, is a favorite recreation ground for golfers. Pop., 1901, 14,904; 1911, 29,606.

MITCH'EL, JOHN (1815-75). An Irish Nationalist agitator. He was born at Camnash, County Londonderry, Ireland; was educated at Trinity College, Dublin; and studied and practiced law. Through his *Life of Hugh O'Neil, Prince of Ulster* (1845), he gained a reputation as a writer and a Nationalist. He became a contributor to the *Irish Nation*, and, after the death of Thomas Osborne Davis, was its chief editor. He withdrew from the *Nation* in 1848 and established the *United Irishman*. In the same year he was arrested under the Treason-Felony Act, was convicted and sentenced to transportation for 14 years, and was sent to Bermuda for one year and then to Tasmania. Escaping from the convict colony in 1853, he came to the United States, and in the following year established at New York the *Citizen*. He removed to Knoxville, Tenn., in 1857, started the *Southern Citizen*, and advocated in it the revival of the African slave trade. He lived in Paris in 1860-62, then returned to America, and for a

time edited the *Richmond Enquirer*, a semiofficial organ of the Confederate government. He afterward went back to New York and in 1867 started the *Irish Citizen*, which had only a short career, being discontinued in 1872. He visited Ireland in 1872, and in 1875 he was elected to Parliament from Tipperary, but was declared ineligible and denied his seat on the ground that he was a convicted felon. He was elected a second time, but died before his case could be tested. His three sons were all in the Confederate army in the American Civil War. Besides the work already mentioned he published *The Last Conquest of Ireland* (perhaps) (1860) and *History of Ireland from the Treaty of Limerick* (1868); and edited *The Poems of Thomas Osborne Davis* (1856) and of *James C. Mangin* (1859), with biographies. Consult W. Dillon, *John Mitchel* (London, 1888).

MITCHEL, JOHN PURROY (1879-1918). An American mayor, born at Fordham, N. Y. He studied in St. John's College; graduated from Columbia University in 1899 and from the New York Law School in 1901. Admitted to the bar in the latter year, he was special counsel for the city of New York in 1906-07. His rapid rise in politics was due to his success as an investigator and prosecutor of grafters while commissioner of accounts of New York in 1907-09. To this office he had been appointed by his friend, Mayor McClellan. The trial and conviction of the grafters gave Mitchel standing with the good-government advocates of New York, and he was elected on a fusion ticket as president of the board of aldermen for the term 1909-13. Mitchel was acting mayor and demonstrated ability as an executive officer. A Democrat in politics, he was appointed collector of the port of New York by President Wilson in 1913. In that year, also, he became a candidate for the nomination for mayor on the fusion ticket, contesting for the place with District Attorney Whitman. The citizens' committee gave him the nomination, and in the regular election he defeated the Tammany ticket headed by Edward F. McCall. The issue most prominent was Tammany control, which had been sharply criticized because of alleged graft and the Sulzer impeachment. His administration was characterized by economy and efficiency. Defeated for reelection in 1917, he joined the U. S. Air Service and was killed in an airplane accident July 6, 1918 at the Gerstner Aviation Camp, Lake Charles, La.

MITCHEL, ORMSBY MCKNIGHT (1810-62). An American astronomer, educator, and soldier. He was born in Union Co., Ky., was a clerk for some time in a country store, and graduated at West Point in 1829. From 1829 to 1831 he was assistant professor of mathematics at West Point and in 1832 he resigned from the service. He practiced law in Cincinnati from 1832 to 1834 and for the next 10 years was professor of mathematics, philosophy, and astronomy in the Cincinnati College. In 1836-37 he was chief engineer of the Little Miami Railroad and was consulting engineer to the Ohio and Mississippi Railroad in 1848-53. He was adjutant general of Ohio in 1847. He was an enthusiastic student of astronomy and took an important part in procuring the erection of an observatory in Cincinnati, of which, when it was completed, he became the director, combining with this position in 1859 the directorship of the Dudley Observatory in Albany. On the outbreak of the Civil War he entered the Federal army, was com-

missioned a brigadier general of volunteers in August, 1861, and from September 19 to November 15 commanded the Department of the Ohio. In April, 1862, he was promoted to a major-generalship of volunteers in recognition of a brilliant movement into northern Alabama whereby he secured the control of 120 miles of railway. On Sept. 17, 1862, he was placed in command of the Department of the South, but before he had time to begin active operations he was attacked by yellow fever and died at Beaufort, S. C. He made several important astronomical discoveries, including, with exactness, that of the period of rotation of the planet Mars. He edited the *Sidereal Messenger*, which he founded, from 1846 to 1848, and published a number of works on astronomical subjects, including *The Planetary and Stellar Worlds* (1848); *The Orbs of Heaven* (1851); *Popular Astronomy* (1860), which, with *The Orbs of Heaven*, was reissued at London in 1892. *The Astronomy of the Bible* was published posthumously in 1863. Consult the biography by F. A. Mitchel (Boston, 1887).

MITCHELL. A city in Lawrence Co., Ind., 61 miles northwest of New Albany, on the Baltimore and Ohio Southwestern and the Chicago, Indianapolis, and Louisville railroads (Map: Indiana, E 7). Fruit growing and the manufacture of Portland cement are the chief industries. Of interest in the vicinity are numerous caves, notably Donaldson and Hamer's. The electric-light plant is owned by the city. Pop., 1900, 1772; 1910, 3438.

MITCHELL. A city and the county seat of Davison Co., S. Dak., 72 miles west by north of Sioux Falls, on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads and on the James River (Map: South Dakota, F 4). It has Dakota University (Methodist Episcopal), established in 1888, a Carnegie library, city hall, opera house, and St. Joseph Hospital. The city maintains a beautiful corn palace, where a splendid exposition, attracting a large number of visitors, is given each year. The centre of a fertile agricultural region, Mitchell exports grain and live stock; it has a creamery, railroad and machine shops, cigar and candy factories, grain elevators, brick and lumber yards, wholesale fruit houses, etc. Settled in 1879, Mitchell was incorporated in 1883 and is governed under a charter, secured by general legislative act of 1890, which provides for a mayor, elected every two years, and a city council of which the executive is a member. The water works are owned by the municipality. Pop., 1900, 4055; 1910, 6515.

MITCHELL, ALEXANDER (1817-87). An American financier and railroad president, born near Ellon, Aberdeenshire, Scotland. In 1839 he came to the United States at the request of George Smith, a Scotchman who was interested in the development of the West, and was made president of the Wisconsin Marine and Fire Insurance Company, at the new town of Milwaukee. Mitchell settled in Milwaukee, and his name is inseparably connected with the development of that city and region. In 1861, appointed head of the Milwaukee debt commission, he labored effectively to restore the city's impaired credit. In 1864 Mitchell effected a combination of several roads into the Chicago, Milwaukee, and St. Paul Railroad Company, of which he was president from its organization until his death. He was a Republican until after the war, but left the party on the reconstruction issue, in 1868

was elected to Congress as a Democrat, and served until 1875.

MITCHELL, ALEXANDER FERRIER (1822-99). A Scottish divine and scholar, the historian of the Westminster Assembly. He was born at Brechin in Forfarshire, Sept. 10, 1822, and after graduating from the University of St. Andrews he became minister at Dunnichen (1847-48). He resigned to accept the professorship of Hebrew in the University of St. Andrews. In 1868 he was transferred to the chair of ecclesiastical history and divinity. He held some of the highest offices in the Church of Scotland and was an active member of the Scottish Text and History societies. Among his publications are: *The Westminster Confession of Faith* (1866); *Minutes of the General Assembly 1644-49* (1874); *The Westminster Assembly: Its History and Standards* (1883; new ed., 1895); *Catechisms of the Second Reformation* (1886); *Reprint, with Introduction, of the First Protestant Treatise in Scottish Dialect* (1888). He died March 22, 1899.

MITCHELL, DONALD GRANT (1822-1908). An American author, well known by his pseudonym Ik Marvel. Born in Norwich, Conn., he graduated from Yale College (1841), and for three years worked on a farm near his native town. In 1844 he went to Europe, living for ten years on the island of Jersey, and bringing out on his return *French Gleanings, or a New Sheaf from the Old Fields of Continental Europe* (1847) and in 1849 *The Battle Summer*, sketches reminiscent of the outbreak in Paris two years before. In 1850 he produced *The Lorgnette, or Studies of the Town*, a series of mildly satirical papers in the manner of Irving's *Salmagundi*. The same year and the following year he wrote the books most popularly associated with his pseudonym, *A Bachelor's Reveries* (more recently renamed *Reveries of a Bachelor*) and *Dream Life*. These gained him admission to the American Academy of Arts and Letters. In 1853 Mitchell was appointed United States Consul at Venice. On his return, in 1855, he bought a farm (known as "Edgewood") near New Haven, Conn. There he wrote books dealing, in an agreeable mixture of philosophy, farming, and anecdote, with the joys of country life: *My Farm of Edgewood* (1863); *Wet Days at Edgewood* (1865); *Dr. Johns* (1866), a novel of religious type; *Rural Studies, with Hints for Country Places* (1867); and several books of travel and sketches, such as *Seven Stories, with Basement and Attic* (1864); *English Lands, Letters, and Kings* (4 vols., 1889); *American Lands and Letters* (2 vols., 1898-99). Consult P. E. More, *Shelburne Essays* (5th series, New York, 1908).

MITCHELL, EDWARD PAGE (1852-). An American newspaper editor. He was born at Bath, Me., and in 1871 graduated from Bowdoin College, which conferred on him the honorary degree of Litt.D. in 1907. He joined the staff of the Boston *Advertiser* in 1871, but after 1875 was on the editorial staff of the New York *Sun*, of which he became editor in 1911. In 1913 he was a special lecturer at the Columbia School of Journalism. In 1909-11 he was president, and thereafter was vice president, of the Sun Printing and Publishing Company. Mitchell's writing gave the *Sun's* editorial page the reputation of being one of the most brilliant in the country. He contributed stories and sketches to the magazines,

MITCHELL, ELISHA (1793-1857). An American scientist, born at Washington, Conn. He graduated at Yale in 1813 and was ordained into the Presbyterian ministry in 1821. After teaching in Yale he became professor of mathematics and natural philosophy at the University of North Carolina in 1817, and in 1825 professor of chemistry, mineralogy, and geology at the same institution. In the capacity of State surveyor he ascended a number of the North Carolina mountains, and was finally killed by a fall from a precipice on a mountain which he had just ascertained to be the highest in the United States east of the Rockies. On this summit, called Mount Mitchell (see BLACK MOUNTAINS), the discoverer's body is buried. His works include a series of reports on the geology of North Carolina (1826-27); *Elements of Geology, with an Outline of the Geology of North Carolina* (1842); and various articles which he contributed to scientific publications.

MITCHELL, HENRY (1830-1902). An American hydraulic engineer, brother of Maria Mitchell. He was born in Nantucket, was educated in private schools, and early devoted himself to the study of tides and river currents, being first employed by the United States Coast Survey to report on the waters about Nantucket and Marthas Vineyard. After assisting the commissioners on harbor encroachments in New York City and discovering the underflow of the Hudson (1859), Mitchell was consulting engineer to the United States Commission on Boston Harbor (1860-67) and member of the commission; in 1867 was sent to study the decline of Greytown harbor, Nicaragua; and in 1874 was appointed a member of the board of engineers to improve the mouth of the Mississippi. In 1879 he visited the Suez Canal and reported on it. Mitchell was elected to the National Academy of Sciences in 1885 and in 1888 retired from active business. His papers on physical hydrology mostly appeared in the United States Coast Survey Reports.

MITCHELL, HINCKLEY GILBERT (1846-). An American theologian, born at Lee, N. Y. He graduated at Wesleyan University (1873) and at the Divinity School of Boston University (1876), and after studying at Leipzig, preached in the Methodist Episcopal church at Fayette, N. Y. (1879-80); taught at Wesleyan (1880-83); and thereafter until 1905 was professor of Hebrew and Old Testament exegesis at Boston University. For denying the historicity of the early chapters of Genesis he was refused confirmation by the Board of Bishops of the Methodist Episcopal Church in 1905. From 1906 to 1910 he was engaged in exegetical studies, and then became professor of Hebrew and Old Testament exegesis at Tufts College. He was director of the American School for Oriental Study and Research in Palestine in 1901-02. His publications include: *Hebrew Lessons* (1884, 1897); *Amos* (1893), a translation of Piepenbring's *Theology of the Old Testament* (1893); *Isaiah: A Study of Chapters i-xii* (1897); *Genesis* (1909); *Ethics of the Old Testament* (1912).

MITCHELL, JOHN (?-1768). An Anglo-American botanist and geographer, a physician by profession. He settled at Urbana, Va., about 1700. It was after him that the *Mitchella repens* was named by Linnæus. He wrote *Nova Plantarum Genera* (1741) and an *Essay on the Causes of Different Colors of People in Different*

Climates (1744); but his name is best known in connection with *A Map of the British and French Dominions in North America* (1755).

MITCHELL, JOHN (1870-). An American labor leader, born at Braidwood, Ill. He attended night schools as a boy and later studied law for a year. Afterward he made a private study of economics. He became a coal miner in 1882; worked and traveled in the West from 1885 to 1890; was made a subdistrict secretary and treasurer of the United Mine Workers of America in 1895; and from 1899 to 1908 was president of the organization. During his administration the union was substantially enlarged, and he effectively gave his influence and efforts to securing increase of wages and an extension of the benefits of the eight-hour law. Mitchell served as fourth vice president of the American Federation of Labor in 1898-1900 and as second vice president from 1900 to 1914. He directed the successful strikes of the anthracite miners in 1900 and 1902; the latter was brought to a close largely as a result of Mitchell's offer as the representative of the miners to accept the decision of a commission of arbitration to be appointed by the President of the United States (Roosevelt). From the first he exerted his influence in behalf of good faith on the part of labor unions in all dealings with employers. From 1908 to 1911 he was chairman of the Trade Agreement Department of the National Civic Federation, and thereafter was a member of numerous industrial commissions in New York State. Mitchell, in company with Gompers and Morrison (qq.v.), was involved in the famous Buck Stove case. The American Federation of Labor had been publishing a list of manufacturers whom they regarded as unfair in their dealings with organized labor, and advised that the organization boycott their production. Among these names was that of the Buck Stove and Range Company. In 1907 this company secured, in the court of the District of Columbia, an injunction against the officers of the federation. The publication of the name on the black list continued, however, and Mitchell and his colleagues were, in 1908, adjudged in contempt of court and sentenced to a term of imprisonment. Although the case was later dismissed on technical grounds by the Supreme Court, it was important in that it gave much impetus to the movement against injunctions in labor questions—a movement which secured prohibition of such use in the Clayton Antitrust Act of 1914. In 1914 Mitchell was appointed by Governor Glynn of New York to the State Workmen's Compensation Board for a four-year term, and when, in 1915, a new Industrial Commission took over the functions of the Board, he became a member of this. He is author of *Organized Labor: Its Problems, Purposes, and Ideals* (1903) and *The Wage Earner and his Problem* (1913). Consult H. W. Laidler, *Boycotts and the Labor Struggle* (New York, 1914). See INJUNCTION.

MITCHELL, JOHN AMES (1845-1918). American editor and author, born in New York City and educated at Exeter, N. H., and at the Lawrence Scientific School, Harvard, after which he studied architecture (1867-70) in Boston and at the Ecole des Beaux-Arts, Paris. He returned to practice for six years in Boston, but in 1876 went again to Paris, this time to study drawing and painting. From 1880 to 1883 he was active in New York as an artist,

illustrator, and writer. In 1883 he founded the comic weekly *Life*, perhaps the best periodical of its kind in the United States—an American *Punch* or *Fliegende Blätter*. From the time of its founding Mitchell gave the periodical his closest attention both as to general policy and as to detail. In addition to his work as artist and editor he published: *Croquis de l'Exposition* (Paris, 1879); *The Summer School of Philosophy at Mount Desert* (1881); *The Romance of the Moon* (1886); *The Last American* (1889); *"Life's" Fairy Tales* (1893); *Amos Judd* (1895); *That First Affair* (1896); *Gloria Victis* (1897); *The Pines of Lory* (1901); *The Villa Claudia* (1904); *The Silent War* (1906); *Dr. Thorne's Idea* (1910); *Pandora's Box* (1911).

MITCHELL, JOHN KEARSLEY (1798–1858). An American physician, born in Shepherdstown, Va. He graduated at the Medical College of the University of Pennsylvania in 1819. Before he went to Philadelphia in 1822 to practice his profession he made three voyages to the Far East as ship's surgeon. In 1826 he became professor of medicine and physiology at the Philadelphia Medical Institute and in 1833 professor of chemistry at the Franklin Institute. From 1841 to 1858 he was professor of the theory and practice of medicine in Jefferson Medical College. His works include: *St. Helena* (1821), a poem; *On the Wisdom, Goodness, and Power of God as Illustrated in the Properties of Water* (1834); *Indecision, a Tale of the Far West, and Other Poems* (1839); *On the Cryptogamous Origin of Malarious and Epidemic Fevers* (1849); the posthumous *Five Essays on Various Chemical and Medical Subjects* (1858), brought out by his son, S. Weir Mitchell (q.v.).

MITCHELL, LANGDON ELWYN (1862–). An American playwright, son of S. Weir Mitchell. Born in Philadelphia, he studied in Dresden and Paris, attended the Harvard and Columbia law schools, and was admitted to the New York bar in 1886. He wrote under the pen name of John Philip Varley, and his plays include: *In the Season*, produced in London, 1893; *Becky Sharp*, produced in 1899, a dramatization of Thackeray's *Vanity Fair*; *A Kentucky Belle*; *Step by Step*; *The New Marriage*; *The New York Idea*, produced in London, 1907; *The Kreutzer Sonata*, adapted from the Yiddish of Jacob Gordin (1907). He is also author of *Sylvian and Other Poems* (1884); *Poems* (1894); *Love in the Backwoods* (1896). Mitchell became a member of the National Institute of Arts and Letters.

MITCHELL, MARGARET JULIA (popularly known as **MAGGIE MITCHELL**) (1832–1918). An American actress, born in New York. She made her first regular appearance as Julia in *The Soldier's Daughter* at the Chambers Street Theatre, New York, in 1851. The parts in which she was best liked were Jane Eyre, Mignon, Little Barefoot, and Fanchon the Cricket. She was married first to Henry Paddock, her manager, in 1868, and later to Charles Abbott, and retired from the stage to live in New York.

MITCHELL, MARIA (1818–89). An American astronomer, born Aug. 1, 1818, at Nantucket, Mass. She was of Quaker ancestry. Her father, William Mitchell, a teacher and then a bank cashier, gave much attention to astronomy as an avocation and made meteorological observations for the government; her brother was the hydraulic engineer Henry Mitchell (q.v.). Miss Mitchell early became greatly interested in

using her father's observatory, poorly equipped though it was, and devoted herself especially to the study of nebulae and comets. During this period she was also librarian of the Nantucket Athenaeum library, where before 1855 she had introduced a system of card indexing. After 1847, when she announced the discovery of a new telescopic comet and was awarded therefor a gold medal by the King of Denmark, Maria Mitchell's position was recognized throughout the scientific world. From 1849 to 1868 she was one of the computers for the *Nautical Almanac*. During her travels in Europe in 1857–58 she was the guest of noted foreign astronomers, and soon after her return the women of America presented to her a large equatorial telescope. At Lynn, Mass., whither she and her father removed, she built an observatory and continued her investigations until 1865, when, on the establishment of Vassar College, she was called to the chair of astronomy. This position Miss Mitchell held until ill health forced her retirement in 1888. Her resignation was not accepted, but she was granted an indefinite leave on full salary. A member and later a fellow of the American Association for the Advancement of Science and a fellow of the American Academy of Arts and Sciences, she was the first woman to be admitted to the latter body. Columbia gave her the degree of LL.D. in 1887. Her later studies were of the sun and of Jupiter and Saturn. Miss Mitchell died at Lynn, June 28, 1889. An observatory in her memory was dedicated at Nantucket in 1908. Her numerous scientific papers have not been published in collected form. Consult: M. W. Whitney (associate and successor of Miss Mitchell at Vassar), *In Memoriam* (Poughkeepsie, N. Y., 1889); Henry Mitchell, in the *Proceedings of the American Academy of Arts and Sciences*, vol. xxv (Boston, 1889–90); P. M. Kendall, *Life, Letters, and Journals of Maria Mitchell* (Boston, 1896); M. K. Babbitt, *Maria Mitchell as her Students Knew her* (Poughkeepsie, N. Y., 1912).

MITCHELL, MOUNT. See **BLACK MOUNTAINS.**

MITCHELL, PETER (1824–1899). A Canadian statesman. He was born in Newcastle, New Brunswick, was educated there, and in 1848 was called to the bar. He was a Liberal member of the New Brunswick Legislative Assembly in 1856–60 and in 1860 was appointed a member of the Provincial Legislative Council. In 1858 he became a member of the New Brunswick administration, firmly supported responsible government, and in 1865 suffered defeat with his government on the question of a federal union of all British North America, which he strongly favored and worked for. He was Premier of New Brunswick in 1865–67, taking office in order to test the opinion of the province on the question of confederation. When the vote was taken, confederation was carried by 33 to 8. He was a delegate to the Charlottetown and Quebec conferences on confederation in 1864 and a delegate to London in 1866 to consult in that behalf with the British government. In 1867 he was appointed Senator, but in 1874 resigned. He was Minister of Marine and Fisheries in the coalition cabinet of the Dominion government in 1867–73, was the original organizer of that department, and in 1882 was elected to the Dominion Parliament for Northumberland County, New Brunswick. In 1885 he purchased the *Montreal Herald* and for some years was

its editor. He was in 1897 appointed inspector of fisheries for the Atlantic provinces. His publications include *A Review of President Grant's Recent Message to the United States Congress, Relative to the Canadian Fisheries and the Navigation of the St. Lawrence River* (1870) and *Notes of a Holiday Trip* (1880).

MITCHELL, PETER CHALMERS (1864–). A British zoölogist. He was born in Dunfermline, Scotland, the son of a clergyman; was educated at Aberdeen and at Christ Church, Oxford; and was assistant in zoölogy at Oxford in 1888–91. He lectured on biology at Charing Cross Hospital in 1892–94 and in 1903 became examiner in zoölogy to the University of London and secretary to the Zoölogical Society of London. Besides contributions to technical periodicals he wrote: *Outlines of Biology* (1894); an excellent critical sketch of Huxley (1900); *The Childhood of Animals* (1912).

MITCHELL, SAMUEL ALFRED (1874–). An American astronomer. He was born at Kingston, Ontario, where he graduated M.A. at Queen's University in 1894. In 1898 he took his Ph.D. at Johns Hopkins. At Columbia he was tutor in astronomy (1899–1905), instructor (1905–08), and adjunct professor (1908–13), and at the Yerkes Observatory (Williams Bay, Wis.) research associate in the summers of 1907 and 1909–11. In 1913 he became professor of astronomy and director of McCormick Observatory at the University of Virginia. He was a member of the United States eclipse expeditions to Georgia in 1900, to Sumatra in 1901, and to Spain in 1905.

MITCHELL, SAMUEL AUGUSTUS (1792–1868). An American geographer. He was born in Bristol, Conn., but removed to Philadelphia. He prepared textbooks of geography for the use of schools, as well as maps and treatises. His books had a very extensive sale. His publications included: *American Traveler* (1843); *General View of the World* (1846); *Geographical Reader* (1849); *Traveller's Guide through the United States* (1850); *Universal Atlas* (1851); and many other works.

MITCHELL, S(ILAS) WEIR (1829–1914). A distinguished American neurologist and man of letters. He was born in Philadelphia, Feb. 15, 1829, the son of John Kearsley Mitchell (q.v.). Although ill health prevented graduation with his class at the University of Pennsylvania, he later entered Jefferson Medical College, Philadelphia, and took his degree in 1850. After a few years spent in general practice, Mitchell turned his attention almost entirely to diseases of the nervous system, a field in which he early achieved eminence. His special title to fame is derived from his elaboration of the system of rest treatment which has borne his name for many years and has been adopted, with modifications, the world over. His earliest work of importance consisted of researches upon the chemical composition and physiological action of the venom of snakes, in 1866 and later. He was assistant surgeon to the United States Hospital for Nervous Diseases during the Civil War and thereafter was a prolific contributor to medical literature. Besides scores of essays and monographs upon toxicology, comparative physiology, and clinical medicine, his publications include the following books or pamphlets on medical subjects: "Researches upon the Venom of the Rattlesnake," in *Smithsonian Contributions to Knowledge* (1860); *Injuries of Nerves and*

their Consequences (1864); *Wear and Tear, or Hints for the Overworked* (1873); *Rest in the Treatment of Disease* (1875); *Fat and Blood, and how to Make them* (1877); *Doctor and Patient* (1888); *Clinical Lessons on Nervous Diseases* (1895). Among his later papers may be mentioned *A Clinical Reëxamination of the Motor Symptoms of Chorea* (1898) and *The Medical Department in the Civil War* (1914).

Dr. Mitchell first turned his attention to fiction and general literature during the Civil War, when he wrote *The Children's Hour*, to be sold during the great fair of the Sanitary Commission in Philadelphia. Among other pieces of juvenile fiction was *The Wonderful Stories of Fuz-buz, the Fly, and Mother Grabem, the Spider* (1867). His first novels were *Hephzibah Guinness, Thee and Thou*, and *A Draft on the Bank of Spain* (all published in 1880). Other books followed, including: *In War Time* (1882); *Roland Blake* (1884); *Characteristics* (1892); *Collected Poems* (1896); *Hugh Wynne, Free Quaker* (1898), a story of the American Revolution which ranks among the best of American historical novels; *The Adventures of François* (1898); *Dr. North and his Friends* (1900); *Circumstances* (1901); *The Youth of Washington* (1904); *Constance Trescott* (1905); *A Diplomatic Adventure* (1906); *The Red City* (1908); *John Sherwood, Ironmaster* (1911); *Westways* (1913); *Complete Poems* (1914).

Dr. Mitchell's eminence in science and letters was recognized by honorary degrees conferred upon him by several universities at home and abroad and by membership, honorary or active, in many American and foreign learned societies. In 1887 he was president of the Association of American Physicians and in 1908–09 president of the American Neurological Association. He died Jan. 4, 1914. Consult, for bibliography of Dr. Mitchell up to 1894, *A Catalogue of the Scientific and Literary Work of S. Weir Mitchell* (Philadelphia, 1894). Critical and biographical matter of interest will be found in the following: Talcott Williams, "Dr. S. Weir Mitchell," in the *Century Magazine*, vol. lvii (New York, 1898); in several articles in the *Book News Monthly*, vol. xxvi (Philadelphia, 1907); E. P. Oberholtzer, "Personal Memories of Weir Mitchell," in the *Bookman*, vol. xxxix (New York, 1914); B. R. Tucker, *S. Weir Mitchell* (Boston, 1914).

MITCHELL, SIR THOMAS LIVINGSTONE (1792–1855). A Scottish explorer. He was born in Stirlingshire, Scotland, began his service in the British army in the Peninsular campaign of 1808, and in 1826 was promoted to be major. He was then sent to make surveys and plans of the Peninsular battlefields. In 1827 he published *Outlines of a System of Surveying for Geographical and Military Purposes* and was made Deputy Surveyor-General of New South Wales in 1828. Besides attending to the routine work of this office he led four exploring expeditions into the interior of Australia. In 1835 he traced the course of the river Darling, which he followed, in 1836, as far as the Murray River, with which it unites. In the same expedition he followed the Glenelg River to the ocean. He gave the world the results of his explorations in his *Three Expeditions into the Interior of Eastern Australia* (2 vols., 1838). He went to England in 1839, and on his return to Australia in 1840 conducted a fourth exploring expedition, which is described in his *Journal of an Expedition*

into the Interior of Tropical Australia in Search of a Route from Sydney to the Gulf of Carpentaria (1848). In addition he published *Australian Geography* (1850) and *The Lusiad of Camoens Closely Translated* (1854).

MITCHELLA. See PARTRIDGE BERRY.

MITCHILL, SAMUEL LATHAM (1764-1831).

An American scientist, born at North Hempstead, Long Island, N. Y. He graduated in medicine at the University of Edinburgh in 1786 and from 1792 to 1801 was professor of chemistry, natural history, and philosophy in Columbia College. In 1796 he made a geological and mineralogical tour of the State of New York, and his report thereon gave him an international reputation in scientific circles. Jointly with Dr. Edward Miller and Elisha H. Smith he established the quarterly *Medical Repository*, of which he was for 18 years the editor. He several times represented his district in the State Legislature and in Congress, and in 1804 was elected a Democratic United States Senator. In 1808-20 he was professor of natural history and in 1820-26 professor of botany and materia medica in the College of Physicians and Surgeons. In 1818 he was appointed surgeon-general of the New York State militia. He was called the "Nestor of American science." His researches embrace a wide variety of scientific and philosophical subjects, and he published a large number of papers and several larger works. Consult "Memorable Events and Occurrences in the Life of Samuel L. Mitchill, of New York, from the Year 1786 to 1827," by himself and Dr. Francis, contained in S. D. Gross, *Lives of Eminent American Physicians and Surgeons of the Nineteenth Century* (Philadelphia, 1861).

MITE, mit, (AS. *mīte*, OHG. *mīza*, *mizza*, Ger. *Miete*; probably connected with Goth. *maitan*, OHG. *meizan*, to cut). Any one of the Acarina, an order in the class Arachnida. They may be distinguished from other arachnids by their small size; by the unsegmented body, without a constriction between the anterior portion or cephalothorax and the posterior portion or abdomen; and by the lack of median eyes. There are exceptions, however, to all these characteristics, and certain forms have been misplaced even by naturalists. The mouth segments have become united to form a beak or rostrum, but this character is not easily recognized. The young mite, on hatching from the egg, is not provided with eight legs as are other arachnids, but with only four or six, except in the case of *Pteroptus*. In size mites vary from tiny creatures, invisible to the naked eye, to certain tropical forms fully half an inch long.

Typically, mites have four pairs of legs, arranged more or less definitely in two groups. The two hinder pairs are apparently attached to the abdomen, while the anterior pairs are close to the mouth parts, which consist of mandibles of varied character, palpi, and maxillæ. The mandibles are typically chelate, but in several families they are reduced to needle-like piercing organs. In the case of certain gamasid mites the mandibles are nearly as long as the entire animal, and can be wholly retracted within the body, or suddenly extruded to seize the prey. The palpi are of four kinds. Simple, filiform palpi, which have a tactile function, are found in many families. In some parasitic forms the palpi are reduced in size and united to the rostrum. In many predatory mites the palpi are modified for raptorial organs. In

some of the water mites the palpi have become organs for holding the mite to other objects. The legs of mites are composed of from five to seven segments, and commonly terminate in from one to three claws. In many genera a

A MITE OR RED SPIDER (*Tetranychus bimaculatus*).

cup-shaped sucking disk or ambulacrum is attached to the tarsus or last segment. The reproductive organs, as in other arachnids, open on the underside of the abdomen near its base. The body and legs are more or less thickly clothed with bristles, hairs, or scales, which are of characteristic nature and arrangement in each species. In many of the soft-bodied species there are chitinous plates or shields, sometimes so large or numerous as almost completely to cover the mite. In the ticks the body is flat and of a tough, leathery consistency.

The sense organs are few and of simple nature. Many mites have no eyes, but in some there are one or two ocelli-like spots on each side of the cephalothorax. A few families have what are considered organs of hearing. With the ticks this organ is a membrane-covered pit in the anterior tarsi; in the beetle mites it is a pore on the posterior margin of the cephalothorax, from which arises a bristle. The sense of touch is supposed to reside in some of the hairs of the body or legs. In many mites there is a considerable difference in appearance between the two sexes, although there is not often much difference in size.

Centralization is the peculiar characteristic of the anatomy of mites. The various organs are more crowded together than in other arachnids. The digestive system, when complete, consists of the pharynx or sucking organ, the œsophagus, the ventriculus or stomach, with its cæca, the hind-gut, and the Malpighian vessels. The œsophagus is a long, simple tube extending through the centre of the brain. The stomach is of varied size, according to food habits; in some forms it is very small, while the cæca are numerous and long. The hind-gut or intestine is a short tube ending in the rectum. The Malpighian vessels, when present, are two in number and enter the intestine near its end. In some mites there is a well-developed dorsal pulsating organ or heart, but in others it is not present. The nervous system consists of one ganglionic mass surrounding the œsophagus, from which all the principal nerves arise. Many mites have an elaborate system of tracheæ by which they breathe and which open in various parts of the body, in many common species near the mandibles, but in the ticks and gamasids they open by stigmata near the hind legs. A great number of mites, however, have no internal respiratory system whatever. In these the skin is soft and they absorb oxygen by osmosis.

Life History. Nearly all mites deposit eggs, frequently of large size. In a few forms the larvæ issue from the parent, but in some cases it is rather from the egg within the body of the dead mite. In many cases the hard external skin or chorion of the egg splits into halves and

exposes the lining vitelline membrane; this permits the maturing egg to increase in size, which is then called a deutovum. The young larvæ on hatching commonly have six legs, but the gall mites have but four. During the nymphal stage the mite feeds until it attains adult size. In many cases the nymph molts directly into the adult mite, but in several families the nymph often transforms into a creature entirely different from both the nymph and the adult—the hypopial stage, or hypopus, long supposed to be a distinct genus of mites. On its ventral or under surface is an area of sucking disks, by which the hypopus attaches itself to an insect or small mammal and is transported to some new and suitable locality, where it falls from its carrier, molts into an octopod nymph, begins feeding, and in due time becomes an adult mite. The hypopus is, therefore, not a parasite, but a commensal, making use of the carrier only for transportation; and in certain gamasids (*Uropoda*) the mite in this migratorial stage is attached by a thread of hardened excrement to its host.

In some families (as the Trombidiidæ) the larval and nymphal stages are attached to various insects and feed thereon, while the adult is free. In some of the beetle mites the nymph carries on its back old molted skins, eggshells, and other débris. In these mites there is a considerable resting period while the nymph is changing to the adult, a period when much of the internal anatomy is entirely changed; and it has been observed that when the adult emerges its legs are not withdrawn from the legs of the nymph but from beneath the body. In the bird mites there is a transition form between the nymph and the adult female, known as the nymphal female. The adult male mates with this nymphal form, and when the real adult emerges, an egg, already of considerable size, is seen in her body. Parthenogenesis has been observed in a number of mites. As a rule, mites possess no special accessory sexual organs, comparable to those of spiders, but in some male gamasids the mandibles carry the globule of sperm cells and insert it in the female vulva. In many species the males have one pair of legs enlarged and modified to act as claspers for holding the female. The eggs are usually deposited singly, but many gall mites and harvest mites place them in clusters.

Habits. The habits of mites are very diverse. Most mites ordinarily move quite slowly and deliberately; very few mites are fitted for leaping. The spinning mites, or "little red spiders" (*Tetranychus*), produce a tiny thread wherever they go, the accumulated threads of many individuals making a whitish mesh or web. More than one-half of the known mites are parasitic, at least during part of their life. The ticks are well known to infest various mammals, birds, and even snakes and turtles. They have mouth parts especially fitted for cutting into the skin of the host and sucking up the blood. (See Tick.) One group of the gamasids is parasitic on bats, birds, and small mammals. The bird mites live upon the skin and feathers of birds, but as they feed upon epidermal scales and loose bits of feathers, they do not injure their hosts, but are rather of service in keeping the skin and feathers clean. The itch mites burrow within the skin of man and other mammals. Other species live in the cellular tissue of birds. A few occur in the tracheal passages of seals, and

one has been found living in the lung of a monkey. Many species feed on living plants, and the gall mites produce deformations on the leaves and twigs of plants. Since these gall mites are invisible to the unaided eye, the deformations were formerly supposed to be fungi. Many of the beetle mites feed on fungi, lichens, and other low vegetation. A large number of mites are predacious and attack other mites and small insects. There is a large family, the water mites, living in fresh water, sometimes as commensals within the gills of bivalve mollusks; another group lives in the ocean, even at a considerable depth. In recent years investigators have found a number of mites associated with ants.

Injuries. The injuries caused by mites are arranged in two classes—injuries to man and domestic animals and injuries to cultivated plants and stored food. The most notable of the former class are the ticks. The famous miana bug of Persia is a tick of the genus *Argas*, which inhabits houses, and the early travelers in those regions declared that its bite or puncture would produce convulsions, delirium, and even death. Specimens kept in Europe, however, have proved to be comparatively harmless. The moubata bug of Africa is a similar tick with a similar reputation. An allied species, the chicken tick (*Argas miniata*), does considerable damage to poultry in the Southern States. The cattle tick (*Boophilus bovis*) is the most injurious of all mites, as it occurs in nearly all warm countries and is the means of spreading the Texas or Southern cattle fever. The itch mites, that cause a disgusting scaling of the skin, were formerly not uncommon, but modern cleanliness has largely abolished them in the case of man. A species known as the sheep scab mite (*Psoroptes communis*) is the cause of much injury to sheep, both in flesh and wool. The red

CLOVER MITE (*Bryobia pratensis*).

spider (*Tetranychus*) is a perennial source of trouble to greenhouse and outdoor plants, while the clover mite is a pest of fruit trees in the West, and a related form (*Stigmæus*) injures pineapples in Florida. To the family of cheese or flour mites (*Tyroglyphidæ*) belong a number of injurious species. The true cheese or flour mites (*Tyroglyphus* and *Aleurobius*) feed on a great variety of stored products—cheese, flour, hams, cereals, drugs, seeds, and dried fruits. Although they are very small, they multiply so rapidly that attacked materials are completely overrun with them in a few days. Some species infest mushrooms and are a serious hindrance to their cultivation. The bulb mite or eucharis mite (*Rhizoglyphus*) burrows within bulbs and the roots of plants, thereby giving entrance to destructive fungi; the bulbs of lilies and orchids are particularly subject to their ravages. A few species of gall mites are of great economic

importance, especially the pearleaf blister mite (*Eriophyes pyri*), which is a notorious enemy of pear culture in the United States. Certain species of Tarsonemidæ, living in enormous numbers in the heads of grasses, are known to cause a whitening of the grass, called silvertop.

Comparatively few mites are beneficial to man. One of the harvest mites is known to destroy the eggs of grasshoppers, and various species of *Cheyletus* prey on the flour mites and other injurious forms. Several species have been found feeding on scale insects.

Classification. The mites, formerly all kept in one family, have, in recent years, been divided into from 10 to 30 families, according to the author. The leading families are the following:

Trombididæ and Rhyncholophidæ, or harvest mites; many of large size and bright-red color.

Eupodidæ, consisting of many small, soft-bodied species that occur on moist soil.

Tetranychidæ, spinning mites, red spiders, and clover mites.

Bdellidæ, or snouted mites, from the long, projecting mandibles; predacious.

Cheyletidæ, mites with stout, spiny palpi; predacious or parasitic.

Oribatidæ, or beetle mites; so called from their hard and often shining bodies; very numerous, but of little economic importance.

Gamasidæ, many predacious and lurking commonly under fallen leaves and in moist places.

Ixodidæ, or ticks, all parasitic.

Tarsonemidæ, soft-bodied and of curious structure.

Tyroglyphidæ, cheese and flour mites, soft-bodied forms, in which the hypopus stage is very common.

Hydrachnidæ, or fresh-water mites; and Halacaridæ, or marine mites.

Sarcoptidæ, or itch mites; and Analgesidæ, or bird mites.

Eriophyidæ, or gall mites, remarkable for their minute size, tapering, annulate body, and possessing only four legs. See CHIGOE, 2.

MITFORD, JOHN (1781-1859). An English author and divine, born at Richmond in Surrey, Aug. 13, 1781. He graduated B.A. from Oriol College, Oxford, in 1804. Five years later he took orders in the English church, and in 1810 he received from Lord Redesdale the vicarage of Benhall in Suffolk. A few years later he obtained two other livings in the same shire. At Benhall he built a parsonage, collected a choice library, and amused himself in gardening. He took permanent lodging in London, where as time went on he came to live for most of the year. He was an intimate friend of Samuel Rogers, of Charles Lamb, and of other literary men. From 1834 to 1850 he edited the *Gentleman's Magazine*, to which he contributed largely. He died at Benhall, April 27, 1859. His *Miscellaneous Poems* appeared in 1858. For the Aldine edition of the English poets he contributed 11 memoirs. His best critical work was on Gray, found in *The Works of Thomas Gray* (1814) and in the Aldine edition (5 vols., 1835-43). His researches have been very freely used by succeeding editors. Mitford left three volumes of manuscript on Gray and a large mass of other manuscript, much of which is now in the South Kensington Museum and the library of the British Museum.

MITFORD, MARY RUSSELL (1787-1855). An English authoress, born at Alresford, Hampshire, Dec. 16, 1787. In 1797 she drew £20,000

in a lottery, with a part of which her father built a house at Reading. She was sent to a good London school for a short time (1798-1802) and then returned to her father's house. At this time she was reading extensively. In 1810 she published *Miscellaneous Poems*, which were immediately followed by other volumes (1811, 1812, 1813). The family, reduced to poverty as a result of the father's improvidence, moved in 1820 to a laborer's cottage at Three Mile Cross, a village near Reading. For a living she now began writing for the magazines and the stage. Among her plays (tragedies), which were moderately successful, are *Julian* (1823), *Foscari* (1826), and *Rienzi* (1828). In the meantime she had taken to writing sketches of village life as she had observed it. They were published (5 vols., 1824-32) in installments, under the title *Our Village*. These descriptive pieces possess charm, grace, and humor akin to Jane Austen's. They were followed by the more regular novel of country life, *Belford Regis* (1835), and, after a long interval, by *Atherton and Other Tales* (1854). In 1851 Miss Mitford removed to a near-by cottage at Swallowfield, where she died, Jan. 10, 1855. Consult: A. G. K. L'Estrange, *Life of Mary Russell Mitford* (London, 1870); id., *The Friendships of Mary Russell Mitford as Recorded in Letters from her Literary Correspondents* (2 vols., ib., 1882); J. T. Fields, *Yesterdays with Authors* (Boston, 1899); W. J. Roberts, *Mary Russell Mitford: The Tragedy of a Blue Stocking* (London, 1913); *Correspondence of Mary Russell Mitford with Charles Boner and John Ruskin*, edited by Elizabeth Lee (New York, 1915).

MITFORD, WILLIAM (1744-1827). An English historian, born in London. He studied at Queen's College, Oxford, and in 1769 became a captain in the South Hampshire militia. He made the acquaintance of Gibbon, then a fellow officer, by whose advice and encouragement he was induced to undertake his celebrated *History of Greece*. The first volume of this work appeared in 1784, and the fifth and last in 1810; it was supreme in European literature till Grote's *History of Greece* appeared. He was three times elected to Parliament, and was professor of ancient history at the Royal Academy. He also wrote *An Essay on the Harmony of Language* (1774) and several minor works.

MITH'AN. The name of the gayal (q.v.), among the Indo-Chinese tribes west of the Bay of Bengal.

MITHRADATES. See MITHRIDATES.

MITH'RAS (Gk. *Mithras*, OPers. *Mithra*, Skt. *Mitra*, friend). One of the chief deities of the ancient Persian religion. The god seems to have been known to the Indo-Iranians before their separation, as he appears in both the Avesta and the Veda. He is a god of light, invoked in company with the heaven (Ahura and Varuna), and is the guardian of truth and the enemy of all falsehood. In India this deity seems to have been early superseded, but in Persia he retained his place as one of the chief gods. It may be considered very doubtful whether the god was borrowed from the early Babylonians at a date long before our knowledge begins, more especially as in the earlier texts Mithras is not the sun but the light of heaven. In the Zoroastrian religion he is one of the Yazata, or spirits of the second rank, though even here he occupies a high position, seeing and knowing everything, a being whom it is impossible to deceive and in constant

conflict with the powers of darkness, so that he becomes a warrior god, who is the chief helper of Ahura-Mazda in his struggle with Ahriman (see ZOROASTER; ZOROASTRIANISM) and, by a natural development, of truth and loyalty. In the Old Persian inscriptions, it should be said, he is invoked by the Achæmenidæ along with Ahura-Mazda and Anahita, and his festival (on the sixteenth day of the seventh month) was one of the solemn functions of the state religion. Honored by the numerous princes who built up small principalities throughout western Asia after the division of Alexander's kingdom, the god was a prominent divinity in Cilicia, Cappadocia, and Commagene, though practically unknown in the Greek world. From these regions his worship came to the West to the Romans, through the Cilician pirates conquered by Pompey. It is not mentioned, however, by contemporary Roman writers till the first century of our era, and the earliest Latin inscriptions that name Mithras belong to the early second century. The cult with its mysteries was popular in the army and quickly spread over the whole Roman world, as its monuments in all the frontier provinces plainly show, and became the chief opponent of Christianity. The nature of the religion is obscure, as the sacred writings have perished and information must be drawn either from the writings of Christian adversaries or from the representations in the numerous places of worship. It seems clear that the basis of the cult was derived from the Mazdean worship, but with a considerable mixture of Chaldean worship of the heavenly bodies. Mithras seems to have owed his prominence to the belief that he was the source of all life and could also redeem the souls of the dead and bring them into the better world. This worship was celebrated in underground chambers of small size, to which only those who belonged to the higher degrees were admitted, and was probably conducted according to elaborate ritual prescriptions. (For such a Mithræum at Rome, consult W. Dennison, "The Newly Discovered Mithræum at the Baths of Caracalla," in the *Classical Weekly*, vii, 151-152, New York, 1915.) The ceremonies included a sort of baptism to remove sins, anointing, and a sacred meal of bread and water, while a consecrated wine believed to possess wonderful power played a prominent part. With the cult of Mithras went a belief in the immortality of the soul and in the resurrection of the dead; it was this belief in particular that brought the followers of Mithras and the Christians into collision. The mysteries contained seven degrees, of which the first three seem to have been probationary and not to have been admitted to the sacred ceremonies. The degrees are given in this order: (1) *Corax* or Raven; (2) *Gryphus* or Griffin; (3) *Miles* or Soldier; (4) *Leo* or Lion; (5) *Perses* or Persian; (6) *Heliodromos* or Courier of the Sun; (7) *Patres* or Fathers, who were at the head of the cult, and whose chief was the *pater patrum*. The other initiates called themselves brethren (*fratres*). Women seem to have been excluded from the rites proper of Mithras, but in the western part of the world those rites were brought in close alliance with the worship of the Great Mother of the Gods (q.v.), which was open to women as freely as to men. The nature of the initiation is not known. The undoubted similarity in much of this worship to the new religion of Christianity seems only to have made the battle

between the rivals bitterer, and with the triumph of Christianity and the loss of the eastern provinces of the Roman Empire began the destruction of the Mithras worship, and by the end of the fourth century it seems to have been practically extinct in the West. Consult: F. V. M. Cumont, *Textes et monuments figurés relatifs aux mystères de Mithras* (Brussels, 1894-99); id., *Les mystères de Mithras* (2d ed., Paris, 1902), translated by T. J. McCormack as *The Mysteries of Mithras* (Chicago, 1903); id., in *The Open Court* (Chicago, November, 1902); A. Dieterich, *Eine Mithrasliturgie* (Leipzig, 1903); F. V. M. Cumont, *Les religions orientales dans le paganisme romain* (Paris, 1906), translated as *The Oriental Religions in Roman Paganism* (Chicago, 1911); J. B. Carter, *The Religious Life of Ancient Rome* (Boston, 1911); D. N. Robinson, "A Study of the Social Position of the Devotees of the Oriental Cults in the Western World, Based on the Inscriptions," in the *Transactions of the American Philological Association*, vol. xlii (ib., 1913).

MITHRIDATES, mith'ri-dá'téz, or **MITHRADATES** (gift of Mithras, from OPers. *Mithra*, the sun god + *dāta*, given, p. p. of the root *da*, to give). An old Persian name, common throughout the East, borne by several kings of Pontus. The most celebrated of them and the greatest of the rulers of Pontus was Mithridates VI, surnamed *Eupator* and *Dionysus*, but commonly called Mithridates the Great. He was born at Sinope about 134 B.C. and succeeded his father, Mithridates V, about 121 B.C. For a time, however, his mother was too strong for him, so that he withdrew to the mountains and lived there as a hunter. But at the age of about 20 he took the reins of government into his own hands. Little that is certain is known of the early part of his reign. He soon subdued the tribes along the northern coast of the Euxine as far as the Tauric Chersonese and set his son, Machares, on the throne of the Kingdom of Bosphorus (q.v.); he then prepared to extend his conquests south of the Euxine and invaded Cappadocia and Bithynia. Here he encountered the Romans, who restored the kings of Bithynia and Cappadocia to power. Mithridates waged three wars with the Romans, known as the First, Second, and Third Mithridatic wars—the First, 88-84 B.C.; the Second, 83-82 B.C.; the Third, 74-65 B.C. The immediate cause of the First Mithridatic War was the invasion of the territories of Mithridates by Nicomedes, King of Bithynia, at the instigation of the Romans. Mithridates quickly compelled Nicomedes to withdraw, but was in the end defeated by the Roman general Flavius Fimbria, while his general Archelaus was defeated in Greece by Sulla. It was in the course of this war that Mithridates issued an order to all the cities of Asia to put to death, on the same day, all the Roman and Italian citizens who were to be found within their walls. Eighty thousand Romans and Italians are said to have perished in this massacre. As a result of the First Mithridatic War Mithridates consented to abandon all his conquests in Asia, to pay a sum of 2000 talents, and to surrender to the Romans a fleet of 70 ships. The Second Mithridatic War was due to the invasion of Mithridates' dominions by the Roman general Murena. The war was in the main favorable to Mithridates, but was short-lived, Murena being soon ordered by Sulla to withdraw. In 74 B.C. Nicomedes

III, King of Bithynia, died, leaving his dominions by will to the Romans. Mithridates claimed that Nicomedes had left a legitimate son and at once prepared to assert the latter's right. The Third Mithridatic War ensued. At first alone, and then supported by his son-in-law, Tigranes, King of Armenia, Mithridates successfully opposed the Roman forces, but in 66 B.C. the conduct of the war was entrusted to Pompey. (See LUCULLUS, LUCIUS LICINIUS.) Mithridates was then obliged to retreat beyond the Euxine, where, besieged by his son, Pharnaces, who had rebelled against him and had been proclaimed King, he took his own life at Panticapæum in 63 B.C. Mithridates was a specimen of the true Eastern despot, but he possessed great ability and extraordinary energy and perseverance. His want of success was owing, not to his defects as a general, but to the impossibility of raising and training an army capable of coping with the Roman legions. He had received a Greek education at Sinope, could speak more than 20 different languages, and had a taste for art and science and appreciation of them. He owned a magnificent collection of pictures, statues, and engraved gems. In the estimation of the Romans he was the most formidable opponent they had ever encountered. Consult Theodor Reinach, *Mithridate Eupator* (Paris, 1890), translated into German, with corrections and additions by Reinach, by A. Goetz (Leipzig, 1895), and the article "Mithridates, 6," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MITLA, mē'tlá, or **MICTLAN**, mēk-tlān'. A famous ruin 30 miles east of Oaxaca City in southern Mexico. The name is Aztec and means 'the place of the dead.' In the centre of a wide, fertile valley surrounded by mountains are five clusters of stone buildings built around paved courts. Long stone lintels are used over the wide doorways. The walls of heavy concrete are veneered with cut stone and the façades are ornamented with sunken panels containing mosaics of finely carved stones in geometrical patterns. Traces of mural paintings are still visible. Cruciform tombs are located under some of the buildings. Little is known concerning the history of this remarkable site except that it was a centre of late Zapotecan culture captured about 1495 by the Aztecs.

The five clusters of stone buildings have been named (1) group of the Curacy; (2) the Columns; (3) the Arroyo; (4) the Adobe; (5) the South Side. Other foundations exist and a mile or so distant, on an isolated hill, are the remains of a fort.

The buildings, which are worthy of the name of temples or palaces, are massive, rectangular structures of dressed stone, set on platforms and erected with surprising accuracy. The stones are laid with such precision that the joints are scarcely discernible, and for this reason little mortar was required. The ground plan is simple and the rooms are, as a rule, long and narrow, while the walls are but one story in height. The grouping of the buildings is in the form of quadrangles.

The walls are faced with dressed stone or plaster. Mosaic stonework is used lavishly, the designs being frets and other geometric designs. The exterior walls have no openings, but the single or triple doorways that open on the courts are imposing in their massive treatment with monolithic lintels. The rooms were ceiled with

beams of wood or slabs of stone. In case the room was wide two sets of beams were used, supported on a row of large stone columns, some of which are 16 feet high and 36 inches in diameter. The roofs were massive and flat, and probably constructed of beams, cross poles, and filling material of brush, capped with rammed clay, similar to the method employed by the Pueblo Indians of the southwestern United States. The floors were made of a durable cement. On the whole, the Mitla buildings, while formal in plan and profile, show perfect and charming mosaic surface decoration, arranged in panels which exhibit great fertility of geometric design, as well as skill in execution. In the Curacy and Arroyo groups mural paintings resembling the pictographs of the codices were employed on the lintels. A noteworthy feature is that realistic sculpture is almost lacking in these buildings.

Two of the palaces have a basement chamber in the form of a cross. Several of these cruciform structures have been discovered in and near Mitla, but nowhere else in Mexico have they been observed, except at Chila in Puebla. It is surmised that they were sepulchres of important personages. The character of the Mitla masonry is also seen in the interesting fortified hill situated about 1 mile west of the village. In location, massiveness of construction, and skill in plan it ranks with the ancient fortifications of Peru. Piles of rounded stones on the walls indicate that the fort was defended by slingers. The quarries from which the ancient Mitlans secured their materials have been discovered. The blocks were obtained by channeling with stone picks and hammers the full length of the stones and across the ends; then channels were cut down the sides and under the blocks until they could be broken off. Enormous stones in all stages of the work still remain in the quarry. Pottery of excellent design and finish has been found. Painted pottery is uncommon here. Fan-shaped implements, a few celts of copper, and gold bells and beads have been found in the tombs. A remarkable cruciform tomb was found by Saville 5 miles from Mitla. These ruins are mainly of stone, but there are evidences of adobe buildings, and some mounds probably supported wooden structures. The large buildings were probably for religious purposes, but their exact use has not been determined by the researches yet made.

Holmes, "Archæological Studies among the Ancient Cities of Mexico," in *Field Museum of Natural History, Anthropological Series* (Chicago, 1895-97); M. H. Saville, "Cruciform Structures Near Mitla," in *American Museum of Natural History, Bulletin*, vol. xiii (New York, 1900); Eduard Seler, "Wall Paintings at Mitla," in *Bureau of American Ethnology, Bulletin* 28 (Washington, 1904).

MITO, mē'tō, or **MYTHO**. A town of Cochinchina, situated on an arm of the Mekong, about 45 miles southwest of Saigon, with which it is connected by rail (Map: French Indo-China, E 4). It has a college and a hospital and is on the trade route between Cambodia and Annam. Pop., 30,000.

MITO'SIS (Neo-Lat., from Gk. *μῖτρος*, *mitos*, thread). The phenomena accompanying the division of the nucleus of cells, a term proposed by

Fleming in 1882 and superseding "karyokinesis." In cell division the seat of the changes is the nucleus, in which portion of the cell the processes of cell division originate. After the nucleus subdivides the entire cell divides into halves, forming two new cells. Mitosis occurs not only in the division of cells during growth, but the nucleus subdivides, forming the first steps in reproduction or fertilization of all organisms. When the nucleus is about to divide, the chromatic granules forming part of the nuclear substance, and previously scattered throughout the central mass of the nucleus, become arranged in a row, forming a long thread,

STAGES IN MITOSIS.

1, preparatory to division; 2, early stage in separation of chromosomes; 3, later state in separation; 4, formation of daughter nuclei at poles, and of wall at equator of spindle.

which extends through the nucleus in an irregular spiral (spireme) and then divides into portions (chromosomes) of fairly equal length. The chromosomes are shaped like long loops, which afterward become shortened, thus giving rise to short loops, straight rods, or rounded granules. As a rule the number of chromosomes is constant for each species of plant or animal and also for successive series of cells during growth. By the time the process has reached this stage a special mechanism appears, which has till now remained concealed in the cell substance. This serves to divide the chromatin elements into two equal parts, to separate the resulting halves from one another, and to arrange them in a regular manner. At the opposite poles of the longitudinal axis of the nucleus two clear bodies—the centrosomes, each surrounded by a clear zone, the so-called sphere of attraction—now become visible. These were first discovered by Fol, by Van Beneden, and also by Boveri, who recognized their importance. They appear to possess a great power of attraction over the vital particles of the cell, so that these become arranged around them like a series of rays. At a certain stage in the preparation for division the substance of the cell body and of the nucleus gives rise to delicate fibres or threads; these fibres are motile and, after the disappearance of the nuclear membrane, seize the chromosomes with wonderful certainty and regularity, and in such a way that each element is held on either side by several

threads from each pole. The chromatin elements thus immediately become arranged in a fixed and regular manner, so as to lie in the equatorial plane of the nucleus. The centrosomes and threads or astral fibres (*aster*), called the spindle, together form the amphiaster. The chromatin elements next split longitudinally, thus becoming doubled, as discovered by Fleming. This splitting is completed by the two halves being gradually drawn farther apart towards the opposite poles of the nuclear spindle, until they finally approach the centre of attraction or centrosome, which has now fulfilled its object for the present and retires into the obscurity of the cell substance, only to become active again at the next cell division. Each separate half of the nucleus now constitutes a daughter nucleus in which the chromatin breaks up and is scattered in minute granules in the nuclear network. The body of the cell then divides, showing two new cells. Roux has pointed out that the whole complex but wonderfully exact apparatus for the division of the nucleus exists for the purpose of dividing the chromatin substance in a fixed and regular manner, not merely quantitatively, but also in respect of the different qualities which must be contained in it. It will be remembered that the chromatin particles or chromosomes are believed to be bearers of heredity. The mechanism of mitosis is thus far unknown. The problem may be solved, as Wilson states, through chemical research.

Amitosis. Mitosis is the indirect division of the nucleus: where the nucleus elongates and directly divides through its total mass the process is called amitosis. This appears to occur exceptionally, but is known to take place in amoeba, in leucocytes, and has been observed in the sperm cells and eggs of batrachians and some insects, but more commonly in pathological tissues.

MITRA, mē'trā (Skt., friend). A Vedic Hindu god of light. He is mentioned most frequently in company with Varuna (q.v.), with whom in the Veda his attributes blend. Although he seems to have been a god of importance in the Indo-Iranian religion, he lost his rank early in the Indian period and was not recognized after the Vedic age. His Iranian counterpart, Mithras (q.v.), however, was one of the chief deities of the pre-Zoroastrian religion, where he represented the sun. Consult Hillebrandt, *Vedische Mythologie*, vol. iii (Breslau, 1902).

MITRA, RAJENDRALALA (1824-91). An Indian Orientalist, born in Calcutta. He belonged to the Kulin-Kayasth caste and was to a great extent self-educated. In 1846 he was appointed librarian of the Asiatic Society in Calcutta, and later philological secretary and vice president of the same organization. In 1885 he was elected president of the society, being the first native to attain that honor. He made

numerous contributions to the *Journal* of the society as well as to the series *Bibliotheca Indica*, editing more than 80 texts, at times with English translations. He was granted the title of Companion of the Indian Empire after the establishment of that Order in 1878 and was made a rajah 10 years later. The most important of his works are: *The Antiquities of Orissa* (2 vols., 1875, 1880); *Buddha Gaya, the Hermitage of Sakya Muni* (1878); *Catalogue of Sanskrit Manuscripts in the Library of the Mahârâjâ of Bikhâner* (1880); *Indo-Aryans: Contributions towards the Elucidation of their Ancient and Mediaeval History* (2 vols., 1881); *The Sanskrit Buddhist Literature of Nepal* (1882); *History of the Asiatic Society of Bengal*, in the centenary review of the society (1885); and a translation of the *Twelve Principal Upanishads* (1891).

MITRAILLEUSE, mē'trâ'yēz' (Fr., mitraille firer, from *mitrailer*, to fire mitraille, from *mitraille*, bits of grapeshot, from OF. *mitaille*, fragments, from *mite*, small bit; ultimately connected with Goth. *maitan*, to cut). A machine gun, in which is combined a number of rifle barrels, with breech-action mechanism, and designed to discharge small missiles with great rapidity. It was invented in Belgium, and adopted by the French a little before the war with Germany in 1870. Its official name is *canon à balles* (bullet cannon). The name *mitrailleuse* is now given to any machine gun whatever. See MACHINE GUN.

MITRAL VALVE. See HEART; CIRCULATION.

MITRE (OF., Fr. *mitre*, from Lat. *mitra*, from Gk. *μίτρα*, mitre, fillet, belt; probably ultimately of Oriental origin). The headdress worn in solemn functions by bishops and some abbots. The ornament is probably of Eastern origin, although the headdress of Eastern prelates at the present day is quite different, being a large round cap something like a crown. The Western mitre is a tall, tongue-shaped cap, terminating in a two-fold point, supposed to symbolize the "cloven tongues as of fire" in which the Holy Spirit descended upon the Apostles; two flaps or streamers fall from it behind over the shoulders. Opinion is much divided as to the date at which the mitre first came into use. Eusebius, Gregory of Nazianzus, Epiphanius, and others speak of an ornamented headdress worn in the Church; but there is no very early pictorial representation which exhibits any head covering at all resembling the modern mitre. From the tenth century, however, it is undoubtedly found in use, although not at first universally. At the Reformation the mitre was practically discarded as a part of the episcopal costume in England, though there are traces of its survival in isolated instances; and the first Bishop of the Episcopal church in America, Seabury, occasionally wore one. In the last half of the nineteenth century the practice was revived with increasing frequency in the Anglican communion. In the Roman Catholic ritual three kinds of mitres are distinguished: *mitra pretiosa*, richly ornamented with jewels, gold, and silver; *mitra auriphrygiata*, made up of gold brocade with embroidery; and *mitra simplex*, formed of white silk or linen damask, with scarcely any decoration, which is worn when black vestments are used. See COSTUME, ECCLESIASTICAL, and Plate.

MITRE, mē'trâ, BARTOLOMÉ (1821-1906).

An Argentine statesman, soldier, and author, born at Buenos Aires. While a mere boy he went to Uruguay with his father and there in 1838 began his literary career as a contributor to *El Iniciador* of Montevideo. He continued to contribute to *El Nacional* and other periodicals during his residence in Montevideo. In 1839 he began his military career and in 1842 played an important part in the defense of Montevideo against the siege by Oribe. He was a member of the secret society, *Asociación Nacional*, which exerted a large influence on the government, and of the Assembly of Notables, which acted in place of a legislative body. A revolt, directed by the Porteños, caused Mitre to flee to Bolivia, where President Ballivian placed him in charge of the Military College. He was the President's chief of staff during a revolution and was decorated by the Bolivian government for his services. Upon the overthrow of Ballivian Mitre was exiled, going first to Peru and then to Chile, where he edited *El Comercio* at Valparaíso and *El Progreso* at Santiago. For attacking the corruption of the government his presses were confiscated and he was arrested and banished to Peru. In 1851 he returned to Argentina and joined Urquiza in the uprising against Rosas. He was in command of a battery of artillery in the battle of Monte Caseros (Feb. 3, 1852), in which Rosas was overthrown. Elected deputy of the Province of Buenos Aires, he openly attacked Urquiza, who was hostile to the Province of Buenos Aires, and assailed the *Acuerdo de San Nicolás*, which gave Urquiza unlimited powers. For this he was banished, but returned (September, 1852) and became a leading figure in the independent Province of Buenos Aires. He served the province as commander of its army, Minister of War (1855), and Minister of Government and Foreign Relations (1857). In 1859 Mitre was defeated by Urquiza at Cépeda, but he refused to surrender unconditionally and accept the constitution formed on the basis of the *Acuerdo de San Nicolás*. Instead he opened a campaign in favor of a revision of the constitution which would save the rights of Buenos Aires and give the country a national organization on a solid and popular basis. In November, 1859, an agreement was made between the Confederation and Buenos Aires, by which the latter rejoined the Confederacy. The next year a Constitutional Convention formed a new constitution (September, 1860), to which Mitre swore as Governor of Buenos Aires and as an Argentine citizen (October 21). The abuses committed by the national government caused Buenos Aires to take up arms in defense of the constitution in 1861. Mitre led the provincial forces and defeated Urquiza in the battle of Pavón (q.v.)—the triumph of the party of Argentine liberty. This is considered Mitre's greatest service to his country. From March to October, 1862, he was *encargado* of the national power, in which position he assembled the Congress which completed the unification of the Argentine nation. In the latter month he was unanimously elected President. He carried out the constitutional reorganization of the country, fostered internal improvement, and encouraged foreign immigration. He failed, however, to secure the federalization of the city of Buenos Aires. Upon the outbreak, in 1865, of the war of Paraguay with Argentina, Brazil, and Uruguay, Mitre joined in a coalition against the Paraguayan dictator

Francisco López (q.v.) and was in command of the allied forces until 1867. Defeated for reelection, he founded and edited for many years *La Nación*, a leading newspaper of Buenos Aires. He was elected Senator and in this position displayed remarkable powers of oratory. Having been defeated by corrupt methods in the presidential election in 1874, he led an ineffectual revolt, for which he was court-martialed and exiled, but he received an amnesty the following year. From 1878 to 1880 he served as deputy in the national Congress and in the latter year led the defense of Buenos Aires in a minor revolt. He actively opposed the administration of President Celman (1886-90) and was popularly acclaimed candidate for the canvass of 1892, but withdrew and joined Ex-President Roca in the support of Luis Saenz Peña, who was selected. He was again candidate for the presidency in 1898, but withdrew, and afterward was elected to the Senate, of which body he served as president. During his active career he devoted much time to literature; indeed, he ranks as one of Argentina's greatest writers. His *Historia de Belgrano y de la independencia argentina* (1857; 5th ed., 4 vols., 1902) and *Historia de San Martín y de la emancipación sud-americana* (1869; 3d ed., 6 vols., 1907) are the best accounts of the South American wars of independence. There is an abridged translation in English of the *Historia de San Martín*, entitled *The Emancipation of South America* (London, 1893), by W. Pilling. Mitre's speeches were collected as *Arengas* (3d ed., 3 vols., 1902). He also published *Rimas* (new ed., 1890); *Ulrich Schmidel, primer historiador del Río de la Plata* (1890); and many other works. Consult J. J. Biedma, *El Teniente General Bartolomé Mitre*, in Bartolomé Mitre, *Arengas*, vol. iii (Buenos Aires, 1902).

MITRE, THE. A former London tavern, the favorite meeting place of Dr. Samuel Johnson, Boswell, and other celebrities. It stood on Fleet Street, and other well-known taverns of the same name were situated on Wood Street and Fenchurch Street, both destroyed in the great fire of 1666.

MITRE SHELL. A gastropod of the genus *Mitra*, family Mitridæ. The shells are very beautiful and much prized by collectors, the favorite being the bishop's mitre (*Mitra episcopalis*). The shell is turreted, smooth, white, spotted with bright red; pillar four-plaited; outer lip denticulated at its lower part; epidermis thin. It is found in East Indian seas. In this genus the shell is fusiform, thick; spire elevated, acute; aperture small, notched in front; columella obliquely plaited; operculum very small. The animal has a very long proboscis, and when irritated emits a purple liquid having a very offensive smell. Over 400 recent and 100 fossil species have been described. These mollusks are found at depths varying from the surface to 17 fathoms, on reefs, sandy mud, and sands. All are inhabitants of warm countries, notably the East Indian and Philippine regions.

MITROWITZ, mī'trō-vīts, or MITROVICZA, mē'trō-vē-chō. A town of south Hungary, in the County of Szerem, on the Save, 43 miles west of Belgrade (Map: Hungary, F 4). On the opposite shore is the Servian town of Mitrovica. The chief industries are tanning leather and silk-worm culture. It has a considerable trade in grain, fruit, and wine, and contains ruins of the

old Roman city of Sirmium. Pop., 1900, 11,518; 1910, 12,909.

MITSCHERLICH, mīch'ēr-līk, EILHARDT (1794-1863). A German chemist, born at Neuende, near Jever. In 1811 he proceeded to the University of Heidelberg, where he devoted himself to history and philology and especially to the study of Persian. In 1814 he published a work on Persian history. In the same year he decided to take up the study of the medical sciences, and while working in chemistry under Link at Berlin he first observed the similarity in the crystalline form of phosphates and arsenates of similar chemical composition. He then set to work measuring crystals of a large number of substances, and was able to establish, in 1819, the principle of *isomorphism*. (See ATOMIC WEIGHTS.) The importance of the discovery was fully recognized by Berzelius, on whose invitation Mitscherlich went to Stockholm, remaining there until 1821. In the following year he was made professor extraordinary, and in 1825 full professor, in the University of Berlin. One of his earliest discoveries after his appointment was that of the occurrence of sulphur in two different crystalline forms—the first observed case of "dimorphism." He further discovered selenic and permanganic acids and nitrobenzene, and studied the formation of ethers, the phenomena of fermentation, etc. His principal work is his *Lehrbuch der Chemie* (1829-35; 4th ed., 1840-48). His papers on various scientific topics appeared in Poggendorff's *Annalen*, in the *Annales de chimie et de physique*, and in the *Abhandlungen* of the Academy of Berlin. A complete edition of his works was published at Berlin in 1896. Mitscherlich was an honorary member of almost all the great scientific societies and received the gold medal from the Royal Society of London for his discovery of the law of isomorphism. Consult Rose, *Eilhardt Mitscherlich* (Berlin, 1864). See CHEMISTRY, section on *History*, paragraph *General Chemistry*.

MITSUKURI, KAKACHI (1857-1909). A Japanese zoölogist, born at Edo. In 1873 he came to the United States, where he received the Ph.D. degree from Yale in 1879 and from Johns Hopkins in 1883. He was appointed professor in the science department of the Imperial University of Tokyo in 1882 and counselor of the university in 1893. In 1896 he was made head of the fur-seal commission and signed, on behalf of Japan, a treaty with the United States and Great Britain. In 1901 he became dean of the College of Science of the Tokyo University and in 1907 was decorated with the Order of the Sacred Treasure in recognition of public service. In later life his time was largely occupied with administrative duties. He was regarded not only as one of the leading zoölogists of Japan, but also as most influential in public life. His most important zoölogical publications, a series of papers on the embryology of the turtles, appeared at intervals from 1886 to 1896.

MITTAG-LEFFLER, mīt'täg-lēf'lēr, MAGNUS GUSTAF, BARON VON (1846-). A Swedish mathematician, born at Stockholm. He studied mathematics at Upsala and later in Paris under Weierstrass and in Berlin. He began his teaching as docent at Upsala in 1872, after having obtained the doctorate there the same year, and five years later became professor of mathematics at Helsingfors. In 1881 he was made

professor of mathematics at the University of Stockholm and subsequently was several times its rector. He was made a member of the Academy of Sciences of Sweden in 1883. His mathematical contributions are connected chiefly with the theory of functions. In 1882, under the patronage of King Oscar, he founded the *Acta Mathematica*, at present one of the leading mathematical journals of the world. The historical part of this journal has since 1887 been published separately by Eneström as the *Bibliotheca Mathematica*. It was Mittag-Leffler's appreciation of Sonya Kovalevsky's (q.v.) work that took her to Stockholm.

MITTERMAIER, mīt'ēr-mī'ēr, KARL JOSEPH ANTON (1787-1867). A German jurist, born in Munich and educated at the universities of Landeshut and Heidelberg. He was a professor at Bonn for two years (1819-21), but the rest of his life was passed as professor of law and jurisprudence at Heidelberg. For many years he was a member of the Baden Legislature, and in 1848 he was President of the Frankfurt Vorparlament, serving afterward as representative of the city of Baden in the German National Assembly. His greatest claim to distinction lies in his extensive writings on jurisprudence, among which is a complete manual of criminal law, *Das deutsche Strafverfahren*, and he was an earnest advocate of reform in the German criminal procedure and in prison discipline. The number of his published writings is very large, including many treatises on branches of law, discussions on all the important questions of his time connected with jurisprudence, and especially on trial by jury and the penal code. His principal works have been translated into many languages. He himself translated Francis Lieber's *Letter on Anglican and Gallican Liberty*, and edited the German translation of the same author's *Civil Liberty*.

MITTERMAIER, (GEORG GOTTFRIED) WOLFGANG (1867-). A German legal scholar and criminologist, the grandson of K. J. A. Mittermaier. He was born in Heidelberg and was educated there and in Berlin, and traveled in the United States, England, France, and Austria. He lectured on criminal law at Heidelberg in 1896 and became professor there in 1899, at Bern in 1900, and at Giessen in 1903. Among his published works are: *Die Militärstrafgerichtsordnung* (1899); *Amerikanische Reformatorien* (1901), based on his own observation; *Kritische Beiträge zur Lehre von der Strafrechtsschuld* (1909); *Wie studiert man Rechtswissenschaft?* (1910).

MITTERWURZER, mīt'ēr-vurts'ēr, ANTON (1818-76). A German opera singer, one of the greatest barytone interpreters of the works of Gluck, Marschner, and Wagner. He was born at Sterzing in the Tirol, made his first theatrical appearance at Innsbruck, and at 21 was engaged at Dresden, where he stayed for 30 years and greatly influenced operatic methods. Mitterwurzer was at his best in such Wagnerian rôles as Wolfram, Telramund, and Hans Sachs.

MITTIMUS (Lat., we send). A written warrant or mandate issued by a competent judicial officer, directing a proper officer to convey safely the body of a prisoner to some jail or place of confinement and commanding the warden to receive and keep the prisoner for a certain time, or until released by due process of law. The act of sending the prisoner to prison is termed the commitment, and this latter term

is now commonly employed to describe the warrant also. Any officer who disobeys such a command is guilty of contempt of court. See COMMITMENT; ARREST.

MITTU, mīt'tōō. An agricultural Negro tribe, akin to the Bongo and living on the upper Nile in southern Sudan between lat. 5° and 6° N. In addition to the Mittu proper the term is also applied to a number of neighboring groups allied in speech and customs though politically independent. Of these the Madi, Madi-Kaya, Abbakah, and Loobah are mentioned by Schweinfurth. They are of earthy red-brown color and below the middle stature, but muscular. The hair is short and crisp. The lighter color of the skin would indicate a type of Hamite blood; but they are all pagans, like the other negroes about them, and little affected by Mohammedanism. Goats, fowls, and dogs are their domestic animals. At certain seasons of the year they are engaged in hunting and fishing. The costume of the Mittu consists only of a fringed apron; but they are fond of decorating their hair and parts of the body, such as the neck, arms, and lips, with ornaments. Their weapons are bows and arrows, with jagged, murderous points. Culturally they are most closely related to the Bongo and seem to form an intermediate link between them and the Azande (Niam-niam). They are markedly musical, with a considerable sense for melody; among their instruments are the lyre, flute, and trumpet. Consult Georg Schweinfurth, *The Heart of Africa* (2 vols., New York, 1874).

MITTWEIDA, mīt'vī'dā. An industrial town of Saxony, Germany, situated on the Zschopau, about 30 miles west-southwest of Dresden (Map: Germany, E 3). It has important manufactures of cotton and woolen goods, cigars, cement, machinery, and furniture. Its institutions include a Realschule and a technical school. Pop. (including Rössgen), 1900, 16,119; 1910, 17,800, chiefly Protestants.

MITYLENE, mīt'i-lē'nē. An island of the Ægean. See LESBOS; MITYLENE.

MIVART, mī'vart, ST. GEORGE JACKSON (1827-1900). An English zoölogist, born in London, Nov. 30, 1827. He was educated at Harrow, at King's College, London, and then, having become a Catholic in 1844, at St. Mary's College, Oscott. He was called to the bar at Lincoln's Inn in 1851, but in 1862 became lecturer on comparative anatomy and zoölogy at St. Mary's Hospital, London. From 1890 to 1893 he held the chair of the philosophy of natural history at the University of Louvain, Belgium. In 1879 he was president of the biological section of the British Association. A most careful and competent anatomist and zoölogist, he wrote a large number of very important memoirs, especially upon the morphology and classification of vertebrates, and contributed largely to the discussion of the question of evolution. He was probably the most learned and powerful critic of Darwin and Huxley in minimizing the effect of natural selection as a factor of evolution and in insisting upon the existence of the guiding action of divine power, especially in the development of man's intellect and spiritual instinct. He distinguished, however, between absolute and derivative creation, maintaining that evolution operated only by means of the latter. His strength lay in natural science, and in this department he held a position of unquestioned eminence.

His efforts to reconcile the facts of science with the doctrines of religion aroused widespread attention. In the field of philosophy he published a number of works, such as *Lessons from Nature as Manifested in Mind and Matter* (1876); *Nature and Thought* (1882); *On Truth* (1889); *The Groundwork of Science: A Study of Epistemology* (1898). He claimed an increasing freedom of thought, which ultimately took him beyond what were considered in the Church the bounds of permissible speculation. After a series of magazine articles (1885-1900) dealing with the relations between science and faith, he was finally excommunicated by Cardinal Vaughan in January, 1900. He died April 1 of the same year in London. His more important works in natural science are: *The Genesis of Species* (1871); *Man and Apes* (1873); *The Common Frog* (1874); *The Cat* (1881); *Dogs, Jackals, Wolves, and Foxes* (1890); *American Types of Animal Life* (1894). His *Essays and Criticisms* (2 vols.) appeared in 1892.

MIWOK STOCK, or MOQUELUMNAN. A linguistic family of Indians in California consisting of the Miwok, Marin, and Middle Town tribes, now numbering 700. Consult A. L. Kroeber, in *American Anthropologist*, vol. viii (Lancaster, Pa., 1906), and S. A. Barrett, *Geography and Dialects of Miwok Indians* (Berkeley, Cal., 1908).

MIXED CADENCE, IN MUSIC. See HARMONY, *Cadences*.

MIXED RACES. Races which are blends of various other races. Of the factors which have been most potent in producing the varieties of man which we find on earth to-day, probably environment and crossbreeding must be assigned the first place. Unfortunately, neither one has been investigated with sufficient care to allow an accurate estimate of its specific influence. Further, the lack of any agreement among anthropologists as to a classification of human races complicates the problem, and until that agreement is reached confusion in the discussion is inevitable.

Certain general observations may, however, be permitted. With regard to crossbreeding it is undoubted that extensive migrations, with consequent blood mixtures, have been going on for an indefinite period. Accurate observation of anatomical and physiological characteristics of certain rather restricted groups, as in Europe, reveals a variability in these characters which has led some observers to conclude that a pure race does not exist at the present time. Recognizing these disturbing facts, however, any one will admit that there are certain types which are relatively permanent. We regard the fair white European as differing permanently from the negro, and both of these equally permanently from the typical Mongol. It is also a matter of common observation that mixture of any two of these types will produce a third, less distinctive, of course, but not to be included in either parent type. The real problem of hybridity as applied to man then arises: Are these subtypes permanent and fertile, or do they tend to revert to either one or the other of the parent types? It is here that the lack of accurate knowledge referred to above prevents positive statement. Early reports as to lack of fertility of certain half-breeds, as in the case of English and Australians, have been shown upon examination to be erroneous or the apparent sterility due to

nonessential factors; and recent observations on half-breed American Indians actually show an increase rather than a decrease in fertility. Looking at the question broadly, it would seem that the evidence, while extremely scanty, points towards the view that any two races (however defined) can unite to form a third; and this in turn with others, until we have a confusion of strains and types in which the originals are indistinguishable, wholly or partly, which is apparently precisely the condition which we find to-day in various regions of the world. An authoritative catalogue of the existing mixed races of the world is therefore impossible. The most notable are probably the well-known mulatto, or cross between European and negro; the mestizo, so called, or cross between European and American Indian; and the complex mixtures which we find in the East Indian Archipelago, where Chinese and Malayan traits predominate.

The social significance of race mixture is of course very great, but the complicating factors in this aspect of the question are even greater than on the physical side. We find here two schools ardently advocating diametrically opposed views both as to the advantages or disadvantages of racial mixtures as well as to the mode of transmission of the characteristics of the parent stocks. The whole problem is involved in the general zoological problem of evolution and heredity, and unassailable ground as to the points involved cannot be assumed until a much wider range of facts is at our disposal and the disputed questions of inheritance in general have more nearly approached solution.

Prof. Eugen Fischer has recently studied the Hottentot-Boer breeds of German Southwest Africa and arrives at a relatively favorable interpretation of this hybrid race, both as to vitality and social characteristics. In America an optimistic view as to miscegenation is held by Prof. Franz Boas. Consult: Franz Boas, *The Mind of Primitive Man* (New York, 1911), and Fischer, *Die rehobother Bastards und das Bastardierungsproblem beim Menschen* (Jena, 1913). See CROSS BREEDING IN MAN.

MIXES. See ZOQUE.

MIXOG'AMY (from Gk. *μῖξο*, *mixo*, mixed, from *μῖγναι*, *mignynai*, to mix + *γάμος*, *gamos*, marriage). A term describing the breeding habits of most fishes, where the males and females congregate on the spawning beds and the number of the former sex is greatly in excess. The same habit has been observed in gars (*Lepidosteus*). On the other hand, the stickleback (*Gasterosteus*) is truly polygamous, several females depositing their eggs in the same nest, guarded by one male only. Some bony fishes (*Ophiocephalus*, and probably all chondropter-ygians) are monogamous, as probably are all the viviparous fishes. Consult Albert Günther, *An Introduction to the Study of Fishes* (London, 1880).

MIXOPHYTE. A term applied to plants of such a plastic nature that they are able to live either independently as autophytes or dependently upon dead organic matter as saprophytes. See AUTOPHYTE; SAPROPHYTE.

MIXTEC, or MISTEC, mè-stèk'. An important Mexican tribe of high culture occupying eastern Guerrero and northwestern Oaxaca. In culture they resembled their southern neighbors, the Zapotec. Like them they were skilled in agriculture, pottery, and weaving, built temples

of hewn stone, kept hieroglyphic records, and had a calendar system. They still keep themselves apart from the political affairs of Mexico and maintain some of their old arts. The population is well over 200,000 and the language is believed to constitute a distinct stock, although often grouped with the Zapotec. The name is Aztec and means 'cloud people.'

MIXTURE (OF, Fr. *mixture*, from Lat. *mis-tura*, mixture, from *miscere*, to mix). An aqueous preparation of an insoluble substance held in suspension by a suitable vehicle. Among the mixtures used in medicine are those of chalk, of rhubarb and soda, and the compound mixtures of iron and of glycyrrhiza (licorice).

MIXTURE. An organ stop, consisting of from three to six ranks of small metallic pipes. It is generally found in large organs, and resembles the sesquialtera and furniture stops, except that it is much higher and shriller. Like other compound stops, the two smaller ranks of the mixture stop change on the upper part of the organ scale into an octave lower. This is necessitated from the fact that the pipes in their upper ranks would produce too small a volume of sound. The mixture can be used only in forte and fortissimo passages, as otherwise the harmonics would be heard too prominently.

MIYA, *mē'yā* (Jap., august house). A term sometimes applied to the mansions of Japanese princes, but more commonly denoting the shrines of the Shinto religion. These buildings represent the ancient cabins of the primitive Japanese modified by the progress of civilization and by Buddhist influence. The earth floor of the hut is replaced by wooden flooring raised 2 or 3 feet from the ground, necessitating steps at the entrance. A veranda going completely round the edifice has been added. The sides of the hut were made of mats, but the shrine has walls of wood. The roofs were originally thatched, but are now covered with shingles, tiles, or even copper. In many shrines Buddhist influence has led to much decoration, but the characteristic of the true miya is extreme simplicity. It contains neither picture, image, nor altar, but only a mirror, or in some instances a pillow for the god. Before the shrines is the *torii* (supposed to signify 'bird rest'), which is sometimes taken for a gateway by tourists. Often many of them are placed before a single shrine. From a cord which hangs above the entrance are suspended *go-hei*, paper cuttings, representative of the offerings of cloth which were made in ancient times. Services are infrequent, usually not oftener than once or twice a year, and in some shrines there are no ceremonies. In 1908 there were 130,258 miya in existence, most of them tiny constructions and only a few of wide reputation. The shrines are divided into four classes—national, provincial, prefectural, and local—and a few are supported in meagre fashion by funds from the Imperial treasury.

MIYADZŪ, *mē-yād'zū*. The most important town of the Japanese Province of Tango in San-in-do (Hondo), 87 miles northwest of Kyoto (Map: Japan, D 6). It was the residence in feudal times of Matsudaira, one of the three daimyos who ruled the province. Pop., about 10,000. In the vicinity, near Ama-no-hashidate (heaven's bridge) is a narrow tongue of land which juts out into the sea in a way much admired by the Japanese.

MIYAJIMA, *mē'yā-jē'mā* (temple island), sometimes called ITSUKUSHIMA. A small, beau-

tifully wooded island in the Bay of Hiroshima, Japan, celebrated as the site of one of the most ancient Shinto shrines of the country. The temple is dedicated to the goddess Benten, worshipped by women for attractiveness and easy childbirth and by men for wealth. It was built in the year 527. The island is also notable for its deer and the absence of dogs. Priests, image carvers, fishermen, and innkeepers make up the population.

MIYAKO, *mē'yā'kō*. Another name for Kyoto, a city of Japan.

MIZON, *mē'zōn'*, LOUIS ALEXANDRE ANTOINE (1853-99). A French naval officer and explorer in Africa. He was born in Paris, studied at the Naval School (1869-72), and in 1877 was sent out to accompany Brazza on his expedition to the region of the Ogowai River in the Congo region. He was stationed at Franceville for six years, and in 1886 he published charts of the Ogowai. Four years afterward he was sent to Adamawa, where he promoted French commercial interests in the Niger country and greatly irritated Great Britain. The latter power in 1893, after Mizon had made a treaty with the Sultan of Hamarua, declared Hamarua a British protectorate and forced Mizon's recall. In 1895 he was made French Resident at Majunga in Madagascar. He died when on his way to take up the duties of Governor of the colony at Jibuti in French Somaliland.

MIZPAH, or **MIZPEH** (Heb., watch, outlook). The name of several places in Palestine, of which the most important are: 1. The heap of stones and pillar set up by Jacob and his brethren as a witness of the covenant between Jacob and Laban. It was also called Galed by Jacob and Jegar-sahadutha by Laban (Gen. xxxi. 44-49), the latter being the western Aramaic rendering of the Hebrew *gal-ed* (heap of testimony). The narrative points to the existence of a sanctuary in Galed which was known as Mizpah. The pillar and the heap of stones are to be regarded as objects for the cult—the former a Baal symbol, the latter a boundary stone, serving also as an altar. It was at this sanctuary that Israel was encamped before the conflict with the Ammonites (Judg. x. 17), which, as Gen. xxxi. 25 informs us, lay in Gilead (upon which Gal-ed represents a play). The indications in the Old Testament are insufficient for determining the site of the place with certainty. It lay north of the Jabbok, and perhaps near the modern Jerash, which answers the conditions involved. 2. The place in the territory of Benjamin where Israel gathered before punishing the tribe of Benjamin for their outrage on the concubine of the Levite at Gibeah (Judg. xix-xx), and probably also the place where Samuel assembled Israel to resist the Philistines and subsequently to present Saul as King (1 Sam. x. 17 et seq.), though it is also possible that the two places may be distinct. The location is not certain. It may be a point on the mountain ridge north of Shafat. These gatherings again indicate the presence of a sanctuary at Mizpah, and the continued importance of the place is made manifest by its choice as a seat of government under Gedaliah (2 Kings xxv. 23; Jer. xl. 6). In postexilic times we meet with references to Mizpah, and it is of special interest to note that in the days of the Hasmonæans Mizpah again becomes a gathering place for the Jews (1 Macc. iii. 46). Besides these two Mizpahs there are references

in the Old Testament (*a*) to the land of Mizpah (Josh. xi. 3) and the valley of Mizpah (ib., xi. 8), which are identical. This Mizpah is mentioned in connection with the battle of Merom (q.v.), and may be located near Hermon. A fourth Mizpah was situated in the "lowland" of Judaea (Josh. xv. 38), and a fifth in Moab (1 Sam. xxii. 3). The use of Mizpah as an inscription for memorial rings is based upon the words occurring in connection with the setting up of the "heap" of stones by Jacob and his brethren: "The Lord watch between me and thee" (Gen. xxxi. 49).

MIZZEN, or **MIZ'EN**. See **MAST**.

MJÖSEN, myē'zen. The largest lake in Norway, situated in one of the most fertile valleys of the country, 36 miles northeast of Christiania (Map: Norway, D 6). Its length is 62 miles, its width averages only 2 and nowhere exceeds 10 miles. It receives the Laugen River at Lillehammer and empties its waters through the Vormen and the Glommen into Skager Rack. Its depth is remarkable, reaching in the southern part 1460 feet, its bottom being here 1050 feet below sea level. The vicinity of the lake is very popular as a summer resort, and steamers ply on it regularly during the ice-free season, which in the southern part, on account of its great depth, sometimes lasts throughout the year.

MLAWA, m'lā'vá (Russ. *Млава*). A district town in the Government of Plozk, 46 miles northeast of Plozk (Map: Russia, B 4). It is at the junction of the Marienburg-Mlawa and Kowel-Mlawa railways. It has five churches, a sixteenth-century town hall, a first-class custom-house, and is an important trade centre. Mlawa was founded in 1429 as an Imperial city, but declined rapidly after the wars with Sweden. Pop., 1910, 18,652. It was the centre of extremely heavy fighting during the European War which began in 1914. In the early part of the war it was captured by the Germans. They strongly intrenched their position, and several Russian attempts to recapture it were unsuccessful, although combined land and aerial attacks were resorted to. See **WAR IN EUROPE**.

MLYNARSKI, mlē-nār'ské, EMIL (1870-). A Polish composer, born at Kibarty in Suwalki. He received his musical education at the St. Petersburg Conservatory, where Leopold Auer (q.v.) was his violin teacher. In 1889 he joined the orchestra of the Russian Imperial Musical Society at St. Petersburg and a few years later became instructor of violin at its Odessa branch. In 1890-93 he toured England and Germany as violin virtuoso. In 1898 he was appointed conductor of the Warsaw Opera House, from 1901 to 1905 was conductor of the Warsaw Philharmonic concerts, and in 1904-07 was director of the local conservatory. In 1908 he moved to London. He wrote violin music, pieces for the piano, songs, and operas. His violin concerto won the Paderewski prize at Leipzig in 1898.

MNA. See **MINA**.

MNEMONICS, nē-mōn'iks. See **MEMORY**.

MNEMOSYNE, nē-mōs'i-nē (Lat., from Gk. *Μνημοσύνη*). In classical mythology, the goddess of memory, daughter of Uranus and Gaia. By Zeus she became the mother of the Muses (q.v.).

MNESICLES, nēs'ī-klēz (Lat., from Gk. *Μνησικλῆς*, *Mnēsiklēs*). A Greek architect, who built the Propylæa (q.v.) of the Acropolis at Athens. His name was found on an inscription

in its ruins, and Plutarch mentions him as its architect.

MNESTRA. See **ERYSICHTHON**.

MO'A (Maori name). A general name for a family (Dinornithidæ) of extinct ratite birds of New Zealand, some of which were of gigantic proportions. The existence of their remains and of legends among the Maoris relating to them was first published in 1838. The exploration of New Zealand revealed bones of these birds in great profusion, on the surface, in peat bogs, in seaside sand dunes, and in certain caves where the dry air had in some cases preserved not only the ligaments binding skeletal parts together but even pieces of dried skin and feathers, which still retained their chestnut and white colors, while footprints and broken eggshells have also been found. Prehistoric camping grounds furnish charred bones and fragments of eggshells.

The moas form a family more nearly associated in structure with the emus, cassowaries, and apteryx than with the ostriches. They were in organization nearest to the kiwis (*Apteryx*), but distinguished by their short beaks and by having aftershafts upon the feathers. They attained not only to great numbers and size in the isolation of New Zealand, but to a remarkable variety, some 20 species being now recognizable. Some were not larger than turkeys, and these perhaps may have had some vestiges of wing bones; but the longer moas were not only wingless but entirely destitute of any shoulder girdle whatever. In Canterbury College, Christchurch, South Island, New Zealand, the museum contains a moa room in which stand two splendid specimens of the *Dinornis maximus*, 12 feet, 3 inches high, as well as other specimens ranging from the size of a small emu to that of a giraffe. That the moa, although now extinct, existed at one time in very considerable numbers may be inferred from the fact that a search expedition by Dr. von Haast in the year 1866 obtained enough bones of this gigantic bird to fill an immense wagon. For a long time—indeed until very recently—it was believed that living specimens of the moa might still be discovered in that almost inaccessible mountainous region on the southwest and westernmost coasts of Otago, where even the Maori, in all probability, never penetrated. The expedition of Herr Reischek, the Austrian naturalist, who spent several months of the years 1887 and 1888 in that solitary country, pretty well dissipated this hope. In the genus *Pachyornis* the leg bones were short, massive, and extremely powerful, so that these are called the "elephant-footed" moas. Consult: Owens, *Extinct Birds of New Zealand* (London, 1879); Alfred Newton, *Dictionary of Birds* (New York, 1893-96); Walter Rothschild, *Extinct Birds* (London, 1907); F. A. Lucas, "Animals of the Past," in *American Museum of Natural History, Handbook Series*, No. 4 (New York, 1913). See **EPYORNIS**; **EXTINCT ANIMALS**; **EXTINCTION OF SPECIES**.

MO'AB. The name given to a people occupying the high table-land east of the Dead Sea and the southern section of the Jordan (Map: Palestine, E 5). The southern boundary was Edom; the eastern, Ammon and the desert; the northern shifted from time to time, but in general was marked by a line some miles beyond the northern extremity of the Dead Sea. This land of Moab is a plateau from 3000 to 4000 feet above the Mediterranean Sea. The western slopes are gen-

erally steep and the aspect of the Moabite Mountains rising to the plateau is barren. It has streams in abundance; besides the Arnon, which divides the plateau, springs and brooks intersect the country. Numerous ruins testify to the former prosperity of the district, while the hundreds of rude stone monuments (stone circles, dolmens, cairns) show that it was densely settled in very early days. According to the biblical account, Moab, the eponymous ancestor of the Moabites, was a son of Lot by one of his daughters (Gen. xix. 37). This story, which traces both Moab and Ammon to an incestuous connection, may be a bit of tribal slander by Hebrew writers to throw discredit on their hated rivals and foes. (See LOT.) The close affiliation, however, between Hebrews and Moabites, which is indicated by the story, is correct. Not only was the language of Moab practically identical with Hebrew, but Moabites and Hebrews belong to the same branch of the Semitic stock, and for an indefinite period Hebrew and Moabitish history form an inseparable unit. The story of the separation of Abraham and Lot embodies a reminiscence of a union once existing between Hebrew and Moabitish clans which was dissolved by a quarrel over land. The land of Moab was included in the Egyptian supremacy over western Asia in the period from the seventeenth to the thirteenth century B.C., and the name Moab occurs in a list of conquests inscribed by Rameses II (1310-1244 B.C.) on one of his monuments at Luxor. The relations between Moab and Israel during the portion of Hebrew history known to us were generally hostile, and this hostility is traced back by tradition to the days of the Exodus (cf. Deut. xxiii. 4-5), but the oldest document we have regarding Moab is a fragment of a song (Num. xxi. 21-30) recalling a victory of the Amorites over Moab and the subsequent defeat of the Amorites by the Hebrews. The song, which bears marks of antiquity, may date from the early struggles of the Hebrews, anterior to the attempts of the latter to conquer Canaan to the west of the Jordan. On the other hand, the story of the endeavor of Balak, King of Moab, to secure the services of Balaam to curse Israel (Num. xxii-xxiv) is looked upon by many scholars as later than this invasion of Canaan, based upon the persistent hostility between Israel and Moab, and illustrating the invincible character of the former; while the apparent allusions to David and his conquests seem to indicate the age which produced the famous oracles. (See BALAAM.) After the conquest of Canaan the Hebrews were frequently at the mercy of the Moabites, as well as of Ammonites and Amalekites. We learn of a King Eglon of Moab, who held the Hebrews in subjection for 18 years (Judg. iii), from which they were freed by Ehud, a Benjamite. Saul appears to have held the Moabites in check, while under David they actually became tributary to the Hebrews. It is not known whether Moab used the opportunity furnished by Jeroboam's revolt to secure its independence, or paid tribute to Israel after its separation from Judah. But from Mesha's inscription (see MOABITE STONE) we learn that Moab was oppressed by Israel for 40 years in the reigns of Omri and his son, and that in the middle of Ahab's reign the yoke of Israel was thrown off (c.860 B.C.). From that time on Moab seems to have maintained its independence of Israel, and had its own kings.

Salmanu paid tribute to Tiglath-pileser IV in 733; Moab took part in the revolt of Ashdod against Sargon II in 711; Kamoshnadab paid tribute to Sennacherib in 701, and Muzura to Esarhaddon and Asurbanipal. Subsequently Moab became tributary to Babylonia. In post-exilic sections of the books of Isaiah and Jeremiah we find references to Moab which point to the continued existence and, in a measure, prosperity of the country, but otherwise throw no light upon its history. The name lingered on into the Christian era. During the Roman occupancy of Palestine the land of Moab was still densely inhabited, as the Roman and Greek remains show, but gradually the Arabs of the desert overran it, and what culture once existed there came to an end. It remained for modern travelers like Seetzen and Burckhardt to rediscover it. The chief god of the Moabites was Chemosh (q.v.), and their religion, so far as we know it, bore the characteristic marks of early Semitic cults.

Clermont-Ganneau, *Recueil d'archéologie orientale*, vol. ii (Paris, 1889); Winckler, *Geschichte Israels* (Leipzig, 1895-1900); G. A. Smith, *Historical Geography of the Holy Land* (London, 1897); Rudolf Kittel, *Geschichte Israels*, vol. ii (2d ed., Gotha, 1912).

MO'ABITE STONE, THE. A stone bearing an inscription of 34 lines in the Moabitish language, discovered in 1868 by the German missionary F. Klein at Diban in Moab. He took no copy of the inscription and gave no description of its contents. The negotiations set on foot for the purchase of the stone by Clermont-Ganneau, attaché of the French consulate at Jerusalem, who had also learned of the existence of the stone, led to quarrels among the Arab tribes claiming an interest in it, and the monument was unfortunately broken to pieces. The fragments, however, were with great difficulty collected, and are now preserved in the Louvre. Prior to the destruction of the stone squeezes had been obtained by Clermont-Ganneau. Some of these were very imperfect, but one was good. From a study of the fragments and the squeezes Clermont-Ganneau was able to publish the text and the first translation. As the result of numerous researches by French, German, and English scholars, the decipherment may now be said to be complete. The characters on the Moabite stone are those of the North Semitic alphabet (see ALPHABET), and the language is so closely allied to Hebrew that the conclusion is justified which makes Hebrew and Moabitish practically identical, though with dialectical differences. The inscription itself refers to the deeds of Mesha, King of Moab, who is mentioned in the very first line, and the interest of the stone is greatly enhanced by the circumstance that he is identical with the Mesha (q.v.) spoken of in 2 Kings iii. 4. Mesha begins in his inscription by referring to the affliction which Moab endured under Omri, King of Israel, and the latter's son (i.e., Ahab, who, however, is not mentioned by name). We know from the biblical narrative that Moab was tributary to Israel during the reigns of Omri and Ahab. This is the "affliction" referred to and is attributed by Mesha to the anger of his deity Chemosh. Thanks, however, to Chemosh, who turned with favor to

Mesha, the latter regained the cities which Israel had captured. Mesha adds in an exaggerated manner that "Israel perished with an everlasting destruction." But while in 2 Kings iii. 5 the revolt of Moab is said to have taken place after the death of Ahab, line 8 of the inscription makes it clear that the 40-year period of Israelitish oppression ended in the middle of the reign of Ahab. Since Mesha knew the length of Ahab's reign, the stone must have been erected after Ahab's death (c.851 B.C.), probably in 849 B.C. The rest of the inscription is taken up with details of the conflict and with building operations undertaken by Mesha. Besides its historical significance the inscription is of geographical importance because of the many names of sites in Moab which it contains. As one of the oldest inscriptions in the North Semitic alphabet the Moabite stone has also great epigraphical value.

MOALLAKAT, mō'al-lā-kāt' (Ar. *Mu'allakat*, the exalted ones). A *diwan*, or collection, of seven poems, made by Hammad, surnamed *al rawiya*, "the reciter." It consisted of what he considered the best poem of each of the following seven bards: 'Amru'l Kais, Tarafa, Zuhair, Labid, Antara ibn Shaddad, 'Amr ibn Kulthum, and Harith ibn Hilliza. Hammad lived in the first half of the eighth century. Ibn Abd Rabbihi (died 940) and Nahhas (died 949) both give the same list of the seven poets. But Ibn Kuteiba (ninth century) mentions also a poem of 'Abid among the Muallakat. Nabigha and A'sha enjoyed a reputation as poets quite equal to any of the seven, and later scholars, like Tibrizi (died 1109), therefore included in the list these two and 'Abid. Ibn Khaldun (died 1406) included also Al Kama, evidently confusing the Muallakat with the *diwan* of Al Alam, which contained a poem of each of the following six: 'Amru'l Kais, Zuhair, Tarafa, Nabigha, A'sha, and Al Kama. As for the title, Ibn Abd Rabbihi seems to have been the first to understand it literally of poems that were "suspended." Against this his contemporary, Nahhas, entered a protest, maintaining that the poems were so called because they were "lifted up," "exalted," "excellent." This view has been accepted in modern times by Hengstenberg, Sprenger, Nöldeke, Ahlwardt, and practically every Arabist, in place of the legend that the poems were hung up in the Kaaba, which is presented in its fullest form by Ibn Khaldun. The text has been published by Lyall, with the commentary of Tibrizi (Calcutta, 1894); Tarafa by Geiger in *Wiener Zeitschrift für die Kunde des Morgenlandes*,

xix (Vienna, 1905), and Antara, with the commentary of Ibn al Anbari by Roscher in *Revista degli studi orientali* (Rome, iv, 1911; vi, 1913). Five of the poems were translated and interpreted by Theodor Nöldeke in *Sitzungsberichte der königlichen Akademie der Wissenschaften*, vols. cxi-cxlv (Vienna, 1900). Sir William Jones published the first English translation, *The Moallakat* (London, 1782); the most recent are those by F. E. Johnson, *Seven Arabic Poems* (ib., 1897), and Kennedy, *Pre-Islamic Poetry* (ib., 1908). See AMRU'L KAIS; AMR IBN KULTHUM; ANTAR, HARITH IBN HILLIZA; LABID; TARAF; and ZUHAIR.

MOAT, môt, (OF. *mote*, embankment, from ML. *mota*, mound, embankment, ditch, castle; probably connected ultimately with Bavarian *mott*, peat, Swiss *mutte*, turf). The ditch round the ramparts of a fortress, often filled with water as an obstacle against attack. See FORTIFICATION; CASTLE.

MOAWIYAH, mō'a-wē'yā (Ar. *Mu'awiyah*) (c.610-680). Caliph and founder of the Ommiad dynasty. He was born at Mecca, the son of Abu Sufian, the bitter enemy of Mohammed. He was made Governor of Syria by the Caliph Othman, and during his term of office conquered the island of Rhodes, but lost Cyprus. On the proclamation of Ali as the successor of Othman in 656 Moawiyah revolted and with the aid of the gifted Amr ibn al Asi attempted to make himself Caliph. He was defeated in several battles by Ali, who, however, was prevented by domestic rebellion and foreign war from completely crushing his rival. Moawiyah was proclaimed Caliph at Damascus, 656, and after the assassination of Ali in 661 he succeeded in speedily reducing the rest of the Empire to submission. His army, after making extensive conquests, was unable, after a long siege and repeated assaults, to capture Constantinople, and in 678 he entered into a treaty of peace with the Byzantine Emperor. Moawiyah not only exerted absolute control over the Moslem Empire, but succeeded in having the caliphate declared hereditary in his family.

MOB. See CROWD.

MOBERLY. A city in Randolph Co., Mo., 129 miles east by north of Kansas City, on the Missouri, Kansas, and Texas and the Wabash railroads (Map: Missouri, D 2). It has the division headquarters and machine shops of the Wabash Railroad, brickyards, flouring and planing mills, foundries and machine shops, ice, shoe, wagon, glove, furniture, and frame factories, culvert works, cement works, and a large grain elevator. There are valuable deposits of coal and fire clay in the vicinity. An extensive trade is carried on in agricultural and dairy products, lumber, live stock, poultry, hides, wool, tobacco, and, of the city's manufactured products, flour and bricks. Moberly has a Carnegie library, two fine parks, an attractive Federal building, two hospitals, and a convent school. The water works are owned by the city. Pop., 1900, 8012; 1910, 10,923; 1914 (U. S. est.), 12,162; 1920, 12,808.

MOBERLY, GEORGE (1803-85). An English

prelate, Bishop of Salisbury. He was born in St. Petersburg (now Petrograd), Russia, and was educated at Winchester and Oxford. In 1826 he took the Oxford chancellor's prize for the best English essay. After connection with Balliol College as tutor and fellow he was in 1835-66 head master of Winchester. He was then presented to the living of Brightstone in the Isle of Wight and in 1868 became a canon of Chester Cathedral. In 1869 he was consecrated Bishop of Salisbury. Although he belonged to the High Church party, in 1872 he urged omission of the damnable sections of the Athanasian Creed (q.v.). Of his numerous published works the most important are: *A Few Remarks on the Proposed Admission of Dissenters to the University of Oxford* (1834); *Sermons Preached at Winchester College* (1844); *Sermons on the Beatitudes* (1860; 3d ed., 1870). In 1868 he delivered the Bampton lectures, which appeared under the title of *The Administration of the Holy Spirit in the Body of Christ*.

MOBERLY, ROBERT CAMPBELL (1845-1903). An English theologian. He was educated at Winchester and at New College, Oxford; was senior student of Christ Church in 1867-80; and was ordained a priest of the Established church in 1870. He was head of St. Stephen's House, Oxford, in 1876-78; served in 1878-80 as principal of the Diocesan Theological College at Salisbury, where he was also chaplain to his father, George Moberly, Bishop of Salisbury; and became vicar of Great Budworth, Cheshire, in 1880. He was appointed professor of pastoral theology at Oxford in 1892 and was chaplain in ordinary to Edward VII in 1901. His writings include: an important paper on "The Incarnation as the Basis of Dogma" (1889) in *Lux Mundi*; *Sorrow, Sin, and Beauty* (1889; 2d ed., 1903); *Ministerial Priesthood* (1897; 2d ed., 1899); his chief work, *Atonement and Personality* (1901); *Christ our Life* (1902); *Problems and Principles* (1904).

MOBILE, mò-bél'. The county seat of Mobile County, the only seaport of Alabama, 140 miles east by north of New Orleans (Map: Alabama, A 5). It lies where the delta of Mobile River (the Mobile, Spanish, Raft, Tensaw, and Apalachee rivers) empties into Mobile Bay, 26 miles north of the Gulf of Mexico, and is served by five railroads—the Louisville and Nashville, Southern, Mobile and Ohio, New Orleans, Mobile, and Chicago, and the Alabama, Tennessee, and Northern. Its total area of 17.51 square miles extends from the west bank of Mobile River westward to the last foothills of the Appalachian chain at Spring Hill. To the north are large gum and cypress swamps, barely at sea level, while land towards the gulf is generally low. The city's streets are laid out at right angles, and many are lined with beautiful white Colonial residences. In the business district are the new United States government building, the Mobile and Ohio station, the Battle House, the City Bank and Trust Company building, the Van Antwerp office building, the County Court House, and the City Hall, which was remodeled from an old Spanish market; also the Providence Infirmary, United States Marine Hospital, Mobile Infirmary, and Southern Infirmary. The cathedral of the Immaculate Conception, a good example of Gothic architecture dating from the French occupation in 1720, is the seat of the Bishop of Mobile. Christ Episcopal Church, with a severe Greek exterior, was built in 1835. Mo-

bile still retains a large number of the philanthropic institutions for which it was famed before the Civil War, when it was the premier cotton-shipping port of the South. Chief among them are the Medical School of the University of Alabama and Spring Hill College, the latter a Jesuit institution of excellent repute, founded in 1830; while McGill Institute, the Convent of the Academy of Visitation, and Barton Academy (the city high school) are worthy of mention. It has three small libraries. Along the bay shore south of the city is Monroe Park; the other chief recreation centres are Washington Square, Lyons Park, and Bienville Square. Across the bay on the east shore are beautiful summer homes, a colony of the advocates of the Henry George single-tax system at Fairhope, while on the west shore are the summer resorts of Coden and Bayou le Batre.

Mobile thrives principally as a port from which the cotton, lumber, and naval stores of the surrounding country are shipped to Cuba, Europe, South and Central America. It has regular sailings to New York, Cuba, Porto Rico, Central America, South America, and Europe. A 27-foot channel leads from the mouth of the bay to the city docks. From 1911 to 1914 the city made many improvements along the water front, and in the creation of municipal docks which cover 1500 feet of water front. The magnificent Turner-Hartwell docks with double slips extend 1600 feet into Mobile Bay, and the city acquired a vast new frontage of dredged land when the channel of the bay was straightened in 1913. Its exports, chiefly logs, hewn timber, shingles, pine lumber, rosin, cotton, and cotton products, amounted in 1913 to \$28,823,873. Imports, chiefly bananas, pineapples, sisal grass, asphalt, potash, and sulphur ore, totaled \$3,675,180. It has several large cotton compresses, a number of large saw mills which turn out pine, gum and cigar-box lumber, and several very important machine shops and a shipbuilding yard. There are also a brewery, sash and blind factories, veneering plants, cotton mills, an agricultural chemical plant, and in the suburb are the main repair shops of the Mobile and Ohio Railroad. In 1910 Mobile as the second manufacturing city of Alabama had invested in her enterprises \$5,250,000, which produced \$5,429,000 of finished goods, or an increase of about 10 per cent in the decade. The farming in the vicinity is much diversified, ranging from cotton to corn, pecans, Satsuma oranges, cabbages and staple vegetables, which are raised in large quantities. Mobile is the centre of an important Gulf fish and oyster industry.

The budget of the city in 1914 was \$494,080, the principal expenditures being \$170,000 for interest on bonds; police, \$76,500; fire, \$68,000; streets, \$82,000. The city owns the water works. Pop., 1860, 29,258; 1900, 38,649; 1910, 51,521, of which 22,763, or 44 per cent, were negroes or of negro descent, in 1920, 60,151.

Mobile was founded in 1702 by Bienville and d'Iberville at a point on the Mobile River north of the present city and known as Twenty-seven Mile Bluff. After experiencing the violent annual spring freshets in 1710 the city was moved to its present site in 1711. It was the capital of the French Province of Louisiana until 1720. In 1763 it was ceded to the English as part of Florida, but in 1780 the Spanish under Galvez captured it, and in 1783 the possession of Spain was confirmed by treaty. It became the property

of the United States under the Louisiana Purchase, and was captured in 1813 by Gen. James Wilkinson. It was the headquarters of Gen. Andrew Jackson in 1814. It was granted a city charter in 1819. It was an important point during the Civil War, and on Aug. 5, 1864, Admiral Farragut bombarded Forts Morgan and Gaines, defending the mouth of the bay, and, after sinking the Confederate ram *Tennessee*, attacked and destroyed the main body of the Confederate fleet under Admiral Franklin Buchanan. (See MOBILE BAY, BATTLE OF.) In the spring of 1865 the Union general Canby defeated forces under Gen. R. C. Gibson, and the Federals took possession of it April 12. After the Reconstruction period it was placed in bankruptcy in 1879 as the Port of Mobile. It received a new charter in 1887. In 1906 a severe southeast gale caused the inundation of lower parts of the city by water backed up in the bay. There were many lives lost and much property destroyed at Coden, Cedar Point, and along the south shore of the county. In 1911 a commission form of government under three commissioners was adopted.

Mobile claims the distinction of being the home of the Mardi-gras celebration in the United States. As Mother of Mystics a masked society known as the Cowbellian de Rakin Society was formed in 1830. This was succeeded by the Order of Myths and the Infant Mystics, which still continue with several other organizations their yearly balls and elaborate street parades. It was the home of Raphael Semmes, the famous Confederate captain; Augusta Evans Wilson, writer; and Father Ryan, the poet priest.

Consult: "Mobile," in L. P. Powell (ed.), *Historic Towns of the Southern States* (New York, 1900); P. J. Hamilton, *Colonial Mobile* (Boston, 1910); id., *Founding of Mobile, 1702-1718* (Mobile, 1911).

MOBILE BAY. The estuary of the Alabama and Tombigbee rivers (whose waters after their junction form the Mobile and Tensaw rivers), running into the Gulf of Mexico, through the southwest portion of the State of Alabama (Map: Alabama, B 5). It is about 27 miles long and has an average width of about 8 miles. The southern part of the bay, stretching about 14 miles eastward from the entrance, is known as Bon Secours Bay; this is shallow, with an average depth of 7 to 15 feet. The entrance to the bay proper, between Mobile Point and the east end of Dauphin Island, is about $2\frac{3}{4}$ miles wide, but is obstructed by a number of islands and shoals. The main channel is about $\frac{1}{2}$ mile wide, and 26 feet deep. Depths within the bay range from five to eleven fathoms. The entrance is defended by Forts Morgan and Gaines, and on Mobile Point is a lighthouse with a revolving light. The bay has also an outlet on the southwest through Grant's Pass, communicating with Mississippi Sound, used by steamers of light draft, and the regular course of the Mobile and New Orleans steamers. See MOBILE BAY, BATTLE OF.

MOBILE BAY, BATTLE OF. A battle of the Civil War in America, fought Aug. 5, 1864, between a Federal fleet under Rear Admiral Farragut and the Confederate ram *Tennessee* aided by three auxiliary gunboats and the guns of Fort Morgan. When Farragut was ordered to the Gulf of Mexico in January, 1864, he wished to attack Mobile and effectually put an end to blockade running, but not until late in July was he assured of the support of a land force and of

ironclads, without which the attack was likely to prove a failure. The city, 30 miles above the Gulf, was protected by Fort Morgan and Fort Gaines, respectively on the eastern and western sides of the entrance to the bay. The channel was closed by piles and torpedoes except for a narrow space under the guns of Fort Morgan. At seven o'clock on the morning of August 5 the four monitors *Tecumseh*, *Manhattan*, *Winnebago*, and *Chickasaw* began to fire upon the fort as they steamed past. They were followed by the wooden sloops *Brooklyn*, *Hartford* (flagship), *Richmond*, *Lackawanna*, *Monongahela*, *Ossipee*, and *Oneida*, to each of which was lashed a gunboat, to prevent it from drifting if disabled. When the *Brooklyn* was almost abreast of the torpedoes she stopped and began to back. The captain of the *Tecumseh* disobeyed orders, steering to the west of the open channel, and his vessel was blown up. As the *Brooklyn* turned across the channel, to prevent fouling, Admiral Farragut ordered the course directly across the torpedoes. Though the torpedoes were felt to strike the bottoms of the vessels, none exploded. Little damage was done by the guns of the fort and the Federal gunboats were released. Soon they sank the *Selma*, drove the *Gaines* aground and the *Morgan* under the guns of the fort, and the fleet prepared to anchor. The ram *Tennessee* coming out from the shelter of the fort attacked the entire Federal fleet. Though hit many times, and rammed by the *Hartford*, the *Monongahela*, and the *Lackawanna*, her armor suffered little damage, but her smokestack was shot away, her steering gear disabled, and her commander had his leg broken by a splinter. Her port shutters were so jammed that it was impossible to use her guns successfully and at ten o'clock she surrendered. General Granger had invested Fort Gaines, August 3, and on August 7 that fort surrendered. Fort Morgan was immediately invested and surrendered on August 23. No attempt was made to take the city at this time on account of the shoal water, but the port was effectually closed. The Confederate losses amounted to 12 killed, 20 wounded, and 280 taken prisoners. The Federals lost 52 killed, 170 wounded. To this should be added from the crew of the *Tecumseh* 93 drowned and 4 captured. Consult: Loyall Farragut, *Life of David Glasgow Farragut* (New York, 1892), and A. T. Mahan, *Admiral Farragut*, in "The Great Commanders Series" (ib., 1892).

MOBILE POINT. A name applied to the end of a long, narrow strip of sand which stretches between Navy Cove and the Bay of Bon Secours to the north and the Gulf of Mexico to the south, at the eastern extremity of the entrance to Mobile Bay. Fort Morgan is situated here, on the ground once occupied by Fort Bowyer (q.v.). Andrew Jackson repaired Fort Bowyer, on Mobile Point, and garrisoned it just in time for it to resist attack by the British on September 15, 1814. On Feb. 11, 1815, 34 days after the battle of New Orleans, a British force captured Fort Bowyer, but withdrew on April 1.

MOBILE RIVER. The west branch of the system of channels through which the united Alabama and Tombigbee rivers discharge into the head of Mobile Bay near the west shore. It is about 38 miles long, and communicates at several points with the Tensaw, or eastern branch of the system.

MOBILES, mō'bēl' (Fr. *garde nationale mobile*, usually called *garde mobile*). A body of

French troops created by law in 1868 and suppressed in 1872. It was composed of young men not included in the class with the colors; men exempt from these classes; men who had procured substitutes; and men who had served but who wanted to enlist anew.

MOBILIAN TRADE LANGUAGE. An Indian trade jargon formerly serving the same purpose of intertribal and trade communication in the Gulf States that is still served by the Chinook jargon (q.v.) along the Columbia and the northwest coast, by the *lingoa geral* in Brazil, and to a certain extent by the sign language (q.v.) of the plains. It was based upon Choctaw, with additions from all the neighboring dialects and from the more northern Algonquian languages, and was the common medium of communication among all the tribes of the Gulf region, from the Atlantic coast of Florida probably as far west as Matagorda Bay in Texas and northward along both banks of the Mississippi to the Algonquian frontier about the entrance of the Ohio. It was called *Mobilienne* by the French, from Mobile, the great trading centre of the Gulf region. Along the Mississippi it was sometimes known as the Chickasaw trade language. In an official report upon the Texas tribes in 1805 Sibley stated that the Mobilian was spoken in addition to their native language by all the Indians who had come from the east side of the Mississippi. It was still spoken in Louisiana 70 years ago, but has since died out with the general decay of the Indian life.

MOBILIER, mó'bē'yá', **CRÉDIT**, krá'dé'. See **CRÉDIT MOBILIER**.

MOBILIZA'TION (Fr. *mobilisation*, from *mobiliser*, to mobilize, from *mobile*, Lat. *mobilis*, movable, from *movere*, to move, Skt. *mov*, to push). The expansion, equipment, and concentration of the national military assets and the organization of the same into the larger tactical units prepared for immediate war service. The term is used to express the general preparation of both the army and the navy, but is more commonly employed with respect to the assembling of armies. For the navy mobilization includes placing in commission all ships held in reserve; receiving, equipping, and assigning the naval reservists; organizing the ships into divisions, squadrons, and fleets; supplying these with the necessary ammunition, coal, and with supply, repair, and hospital ships, etc., providing in general for creating and maintaining "fleets in being."

In continental Europe the national army in war is the "nation in arms," i.e., it is composed practically of the entire able-bodied male population, usually between the ages of 18 and 48. Since it is neither necessary nor possible, for economic reasons, to maintain permanently in peace the great forces that may be temporarily required in war, these Powers have adopted the system of a relatively small peace establishment capable of enormous expansion and rapid concentration when war is imminent. This expansion in size and concentration at threatened points is mobilization. The rapidity of mobilization is one measure of military efficiency, and an important one, for the reason that it affords the opportunity of securing the strategical and tactical advantages of the offensive. The number of trained soldiers and the rapidity of mobilization in any theatre of war are dependent on the form of government, whether centralized or decentralized; on population; on the national

genius for military organization; on the general political policies with respect to neighboring nations; on geographical location; on the local terrain and number of roads and railroads to the theatre of war; on economic conditions; on the system of service in time of peace, compulsory or volunteer, employed in training men for war. All great nations except England and the United States have adopted the compulsory system of training in peace, so that in war such nations, without delay, can embody in a great war army civilians previously trained as soldiers. In England and the United States, where the volunteer system is used, there is no such large body of trained reservists. In order to meet any great national emergency they must depend upon the slow process of volunteer recruiting and training such recruits after war has been declared.

It is true that England, in the special and army reserve class, had trained volunteer reservists, but their number was insignificant compared with the numbers of conscript reservists available for the continental armies when the European War of 1914 began. Mobilization as technically understood in compulsory-service armies has no application in volunteer systems like that of England and the United States, for the reason that there is little or nothing in the way of trained reservists to mobilize, or put "in being." The word mobilization when used with respect to the American or English system would be understood as meaning rather a system of recruiting volunteer civilians and their assemblage in camps for equipment and training. In the Spanish-American War of 1898 it required nearly two months to mobilize and transport to Santiago the insignificant force of about 15,000 men. In the European War of 1914 England was able to mobilize for immediate use in France not more than four divisions, about 80,000 men, and at the end of six months about 720,000 men, of which about half were trained troops, the rest partially trained colonial and Indian contingents and volunteers recruited after the war began. In strong contrast were the wonderful systems of France and Germany. At the end of two weeks France had an active field army of at least 1,380,000 men; Germany an army of 1,850,000 at the end of six days. These were only the initial mobilizations. Later there followed other classes of reservists, until the number of trained or partly trained men totaled an estimated number of 4,400,000 for France and 5,300,000 for Germany. Owing to the extent of territory over which her reservists are scattered and the lack of railways to the German and Austrian frontiers Russian mobilization on those frontiers was much slower than that of Germany. Russia's regular army was estimated at about 1,200,000, with a potential mobilization of 1,850,000 in 30 days. Her ultimate strength in men might reach 7,700,000 provided she had the necessary arms and equipment. Austria's regular army is about 400,000; initial mobilization, in about three weeks, 820,000; ultimate strength, 2,200,000. Japan maintains a peace army of about 250,000; initial mobilization, 600,000; ultimate trained strength, 1,500,000. The United States could mobilize in the United States proper an incomplete field army of about 25,000 regulars in about two weeks and four incomplete divisions (80,000 men) of partially trained militia of doubtful value in about one month; total, 105,000 men in one month. As

there are no trained reservists, further effective increase could not take place until the volunteer recruits had been trained, possibly in six months. All the above figures are estimates for 1914-15. The exact strength in each case is known only to officers of the general staffs, who are extremely careful in their efforts to mislead their possible national enemies.

Details of Mobilization. The new French plan and detailed methods of mobilization, though frequently practiced in peace, had its first complete test in the European War of 1914. The scheme worked smoothly, efficiently, and successfully. The general plan provided: 1. In peace, detailed instructions for the guidance of each reservist; for all private owners of horses, wagons, and automobiles; for all civilian officials, especially the railway and telegraph personnel. 2. Upon the declaration of war, a proclamation of martial law throughout the country; the announcement and posting of a brief general mobilization order designating the days of mobilization and making the requisition for private transportation previously inspected and accepted; putting into effect the military train schedules; taking control of the telegraph and telephone lines; assuming the censorship of the press and military control of cafés selling intoxicating liquor; the supervision of prices asked for food products; etc. The decree of the President of the Republic proclaiming martial law, posted Aug. 2, 1914, read as follows: "The 86 Departments, the territory of Belfort, and the three Departments of Algeria are declared under martial law. Martial law will be maintained throughout the duration of the war." Under French law, "by virtue of martial law, the powers with which the civil authority is clothed for the maintenance of order and police pass at once and in their entirety to the military authority, and the civil authority exercises only those powers of which it has not been dispossessed by the military authority." The powers thus transferred include the right of search of houses, the removal of suspects and individuals without domicile in the district under martial law, the enforced surrender of arms and ammunition and right to search for same, prohibition of publications and assemblages likely to cause excitement and disorder, jurisdiction over crimes and offenses against the safety of the state, against the constitution, or against the public peace, whatever the rank of the principals or accomplices. Citizens continue to enjoy all the rights guaranteed by the constitution, except those which are expressly suspended.

Mobilization was announced to the inhabitants throughout France by posting a copy of the order in conspicuous public places. In the smaller towns and villages the people were assembled by the beating of drums, ringing of bells, etc., the order then being read by a gendarme or town official. Individual reservists in country districts were reached by telephone or messenger. The order was promulgated in the afternoon of August 1 and read as follows:

"THE ARMY AND NAVY. ORDER FOR GENERAL MOBILIZATION

By decree of the President of the Republic the mobilization of the Army and Navy is ordered; also the call for the animals, wagons, and harness necessary for the equipment of those forces.

*The first day of mobilization is Sunday,
Aug. 2, 1914*

Every Frenchman liable for military service must, under penalty of being punished to the full extent of the law, obey the instructions of the mobilization section (see colored pages placed in his individual booklet).

There are included under the present order: all men not present with the colors, belonging:

- 1st. To the Army, including colonial troops and the men of the auxiliary services.
- 2d. To the Navy, including registered sailors and naval reservists.

Table Showing Calendar Dates of Mobilization Days

The first day of mobilization is Sunday, Aug. 2, 1914.

The fifteenth day of mobilization is Sunday, Aug. 16, 1914."

By the promulgation of these two documents announcing martial law and general mobilization respectively the whole of France and Algeria passed smoothly and quickly from a status of peace to a status of war. Every French citizen liable for military duty dropped his work, consulted the colored pages of his individual instruction booklet, reported at a certain hour of a certain mobilization day at a designated railroad station for transportation to the headquarters of his regiment, where he was at once uniformed, armed, and equipped for service in the field with his organization. With equal ease and rapidity were assembled the vast number of animals, wagons, harness, and motor vehicles required for the armies being mobilized. The owner presents his property at a designated time and place, receives an order for the value previously agreed upon, and may, if he so desires, have this order cashed immediately by the local army paymaster. The civilian railway man, the telegraph operator, the business man, the doctor, donned a uniform and, in accordance with individual instructions received in peace, proceeded, if so ordered, with the practice of his business or profession under military control and for the sole benefit of the government or the army.

In the United States mobilization is accomplished as follows: If war appears imminent, mobilization camps are selected by the War Department for the organized militia and volunteers. The regular army is mobilized at its permanent stations. At the mobilization camps troops are assembled and raised to war strength, equipped, and prepared for service. Recruits for the regular army are assembled, equipped, and trained at the five permanent recruit depots (see DEPOT) and then sent to their organizations. Department (territorial) commanders are responsible that all military organizations leave mobilization points: (1) with the full equipment required by existing orders; (2) with sufficient rations and grain to supply them fully while en route; and (3) with two days' rations and grain for use after their arrival at the concentration camps. A concentration camp is a place near the scene of intended operations or near an embarkation point, where troops are assembled for immediate use against the enemy or for transport to an over-sea theatre of operations.

Consult "Pages d'histoire," in *Mobilisation*, Librairie Militaire (Paris, 1914); *Field Service Regulations*, U. S. A. (Washington, 1914). See CAMP; FRONTIER; *Army* sections under countries.

MÖBIUS, mē'bē-us, AUGUST FERDINAND (1790-1868). A German mathematician, born in Leipzig. He studied at the universities of Leipzig and Göttingen. At first he devoted his attention to law, but later, under the influence of Gauss, he took up mathematical astronomy. In 1816 he was made professor at Leipzig and almost immediately afterward became director of the observatory in the Pleissenburg, which was built after his plans (1818-21). His important astronomical and mathematical memoirs appeared from this time on in the *Astronomische Nachrichten*, Crelle's *Journal*, and the *Berichte* of the Scientific Society of Leipzig. His leading mathematical work was *Der barycentrische Calcul* (1827). This contained a novel discussion of homogeneous coördinates, presented the first systematic discussion of the essential differences between the modern and the ancient geometries, set forth the generalization of figures, stated the invariant property of anharmonic ratios (which was, however, known to Menelaus and Proclus), and made extensive use of the principle of duality. He also wrote the following works: *Die Hauptsätze der Astronomie* (1836; 7th ed., 1890); *Lehrbuch der Statik* (1837); *Die Elemente der Mechanik des Himmels* (1843). His *Gesammelte Werke* have been edited by Baltzer, Klein, and Scheibner (4 vols., Leipzig, 1885-87).

MÖBIUS, KARL AUGUST (1825-1908). A German zoölogist. He was born in Eilenburg; studied at Berlin, and in 1868 was made professor of zoölogy at Kiel. There he became especially interested in marine animals, and was a member of the commission of 1871 and 1872 for the investigation of German seas. Möbius went to Berlin in 1887 as director of the zoölogical museum, retiring in 1905. In 1901 he was president of the fifth International Zoölogical Congress at Berlin. His publications include: *Die Nester der geselligen Wespen* (1856); *Die echten Perlen* (1857); *Neue Seesterne des Hamburger und Kieler Museums* (1859); *Fauna der Kieler Bucht* (1865-72), with H. A. Meyer; *Die Auster und die Austerwirtschaft* (1877); *Die Fische der Ostsee* (1882), with Heincke; *Aesthetische Betrachtung der Säugethiere, Mollusken, Vögel, Insecten* (1900-05).

MÖBIUS, PAUL JULIUS (1853-1907). A German psychiatrist and medical writer. Born at Leipzig, he studied there and in Jena and Marburg, graduating as Ph.D. in 1874, as M.D. in 1876. In 1883 he was admitted as privatdocent to the medical faculty at Leipzig, resigning in 1893. From 1885 he was editor of *Schmidts Jahrbücher der gesamten Medizin*. He was a thorough investigator and a prolific writer, not only in medicine but also in social problems. Among his best-known medical works are: *Allgemeine Diagnostik der Nervenkrankheiten* (2d ed., 1894); *Abriß der Lehre von den Nervenkrankheiten* (1893); *Beiträge zur Lehre von den Geschlechtsunterschieden* (1903-04); J. J. Rousseau *Krankheitsgeschichte* (1889); *Ueber das Pathologische bei Goethe* (1898); *Ueber Schopenhauer* (1899); *Ueber das Pathologische bei Nietzsche* (1902). His *Ausgewählte Werke* appeared in Leipzig in 1905. Of his writings intended for a wider circle of readers may be mentioned: *Ueber die Behandlung von Nerven-*

kranken und die Errichtung von Nervenheilanstalten (2d ed., 1896); *Ueber den physiologischen Schwachsinn des Weibes* (7th ed., 1905).

MÖBIUS, THEODOR (1821-90). A German philologist, one of the foremost students of old Norse literature and language, son of August Ferdinand Möbius, the mathematician. He was born at Leipzig, studied there and in Berlin, and in 1852 became docent of Scandinavian languages at Leipzig. He was promoted to professor in 1859, and from 1865 to 1888 he was a member of the faculty of Kiel as professor of Norse philology. Möbius' most valuable work was as an editor of Norse sagas. Especial mention should be made of *Fornsögur* (1860), with Vigfússon; *Edda Sæmundar* (1860); *Íslendingabók* (1869); *Málsháttakvæði* (1873); Snorre's *Háttatal* (1879-81); *Kormákkssaga* (1886). His other work includes the dissertation, *Die ältere isländische Saga* (1852); the valuable bibliography, *Catalogus Librorum Islandicorum et Norvegicorum Ætatis Mediæ* (1856; a supplemental volume in 1880); *Analecta Norrœna* (1859; 2d ed., 1877); *Altordische Philologie im skandinavischen Norden* (1864); *Altordisches Glossar* (1866); *Dänische Formenlehre* (1871); *Ueber die altordische Sprache* (1872).

MOCAYA OIL. See GRUGRU PALM NUT.

MOC'CASIN. See SHOES AND SHOE MANUFACTURE.

MOCCASIN FLOWER. See LADY'S-SLIPPER; also Colored Plate of ORCHIDS, AMERICAN.

MOCCASIN SNAKE, WATER MOCCASIN, or COTTONMOUTH. An aquatic, fish-eating, venomous pit viper (*Ancistrodon piscivorus*) of the southern United States, allied to the copperhead. It may grow to be 4 feet long; is thick and heavy in body; has a tapering tail, without any rattle or spine; and in color is dark chestnut brown, with light marks on the lips, obscure blackish bars on the sides, and the abdomen black blotched with yellowish white. The interior of the mouth, displayed when the snake is about to strike, is cottony white. This serpent exists in large numbers from southern Indiana and southeastern Virginia to the Rio Grande in swamps, marshes, on overflowed lands, and along rivers and bayous, where it is fond of lying in the sunshine upon banks, tussocks, driftwood, or bushes and trees overhanging the water. It never goes far away from such places, and is really a water snake; its food is mainly frogs and fishes. When disturbed it may escape by swimming, but is quite as likely to turn and fight fearlessly. It is one of the most virulent and deadly of all American serpents, but fortunately it does not wander into places where men usually go, except in the irrigated rice fields, where it is greatly dreaded. In captivity it is one of the most untamable and ferocious of known reptiles. It produces eight or ten young annually in midsummer, all fully prepared for offense or defense. The moccasin is "mimicked" by the quite harmless water snake *Natrix*, which, however, is usually much smaller, has a narrower, less triangular and forbidding head, and may always be distinguished by the double row of scales on the underside of the tail. Consult L. H. Stejneger, *Annual Report of the Smithsonian Institution for 1893* (Washington, 1895), and R. L. Ditmars, *The Reptile Book* (Garden City, N. Y., 1914). Cf. COPPERHEAD; RATTLESNAKE.

MOCENIGO, mō'chā-nē'gō. The name of a prominent Venetian family which furnishes several able commanders and doges to the Republic.

The most noted was Tomaso, Doge from 1414 to 1423. At a time when Venice was mistress of extensive possessions, Mocenigo endeavored to maintain her position by a policy of peace. His chief opponent was Francesco Foscari, the next Doge, who urged a policy of conquests on the mainland of Italy. Mocenigo was able to withhold Venice from this course, which afterward proved so disastrous to her power. To him was due the building of the present Doge's palace. At the time of Tomaso's death Venice had reached the zenith of her glory. Consult Alethea Wiel, *Venice* (New York, 1894).

MOCHA, mō'kā, or MA'KHA. A strongly fortified seaport, and once the capital, of the Province of Yemen in Arabia. It is situated on the Red Sea, at the head of a little bay near the Strait of Bab el Mandeb, and 130 miles west-northwest of Aden (Map: Turkey in Asia, E 9). It stands in a dry, arid plain and its water is brought by aqueduct from the hills 16 miles distant. The town is ancient, but is now in a ruinous condition. The harbor is shallow and is frequented only by Arab dhows. It formerly exported large amounts of coffee and other produce, which are now distributed through the ports of Aden and Hodeida. Pop., 5000.

MOCHA STONE, or DENDRITIC AGATE. A name given to those cryptocrystalline varieties of quartz, such as agate and chalcedony, which contain mosslike or dendritic forms, usually consisting of manganese dioxide distributed through the mass. They were originally brought into Europe from Mocha. Of a similar nature is the moss agate.

MOCHNACKI, mōk-näts'ké, MAURYCY (1803-35). A Polish publicist and critic, born at Bojaniec, Galicia. He took part in the revolution of 1830-31, and, after the capture of Warsaw, left his native country and spent the remainder of his life in France. He was the defender of the Romantic school in Poland, and is said to have dealt the deathblow to classicism in that country. His works are *A History of Polish Literature in the Nineteenth Century* (1830) and a valuable *History of the National Insurrection in Poland in 1830 and 1831* (1834).

MOCKING BIRD (*Mimus polyglottos*). The most famous, if not the sweetest and most beautiful, of American songsters. It receives its popular name from its extraordinary powers of vocal imitation. It is often called mocking thrush, and was formerly considered a peculiarly modified thrush, but now, with its near relatives the catbird and brown thrasher, it is classified very near the wrens. The genus *Mimus* is characterized by the elongate form, long tail, short wings, and straight bill, much shorter than the head, notched near the tip, and whiteness of the plumage on the inferior surface of the body. The mocking bird is about 10 or 11 inches long, the tail being nearly one-half the total length. The upper parts are ashy gray; the wings and tail are nearly black, extensively marked with white; under parts grayish white. The bird is very common in the South Atlantic and Gulf States, and in summer ranges as far north as Massachusetts and westward to the Pacific coast. The nest is built in bushes and low trees. It is made of twigs, leaves, weed stalks, and grasses, lined with rootlets, cotton, etc. The eggs are four to six in number, pale greenish blue, heavily spotted and blotched, especially near the larger end, with bright brown. Two and sometimes three broods are reared in the season, which be-

gins early in the spring and lasts until the end of the summer. During the spring and early summer the birds sing all day and even all night, and in many localities the air rings with their music. Their native song is extraordinarily beautiful, but it has in addition the power of reproducing the songs of other birds with such accuracy as to deceive even the imitated birds. There is, however, very great individual difference in this power, for while some birds seem seldom to attempt any mimicry, others are constantly imitating the sounds which they hear.

When taken from the nest young mocking birds readily become accustomed to cage life and may live for many years. They are easily taught and often improve greatly with careful training. The food of the mocking bird is largely composed of insects and berries or seeds. An inhabitant of gardens and roadsides, fond of human habitations, and seldom seen in the woods, the mocking bird is often found in villages and even in the streets of large towns.

Besides the common mocking bird more than a dozen other species of *Mimus* occur in the West Indies, Mexico, Central and South America. The mountain mocking bird (*Oreoscoptes montanus*) of the western United States is a much smaller and quite different bird and not especially notable as a songster. Its more common name is sage thrasher. See Colored Plate of SONG BIRDS with article THRUSH.

MOCKING WREN. The Carolina wren. See WREN.

MOCK MOONS. See HALO.

MOCK ORANGE. A hardy flowering shrub. See CHERRY LAUREL; PHILADELPHUS.

MOCK SUNS. See HALO.

MOCOA, mō-kō'a. An Indian village in southern Colombia, South America. Brinton includes in the Mocoan linguistic family the Almaguereños, Mocoas, Engaños or Mgaños, Patias, Sebondoyes, etc., found between the first and second degrees, on the affluents of the Río Caquetá and near the source of the Putumayo. Consult A. F. Chamberlain in *Journal de la Société des Américanistes de Paris*, N. S., vol. vii (Paris, 1910).

MOCQUEREAU, mōk'kē-rō', DOM ANDRÉ (1849-). A French musical scholar, born at La Tessonalle, near Cholet. He received his education at Paris, and while still very young appeared as cellist in Dancla's chamber-music concerts. In 1875 he entered the order of the Benedictines of Solesmes. There he became intensely interested in Gregorian music, to the study and elucidation of which he devoted his whole life. In 1889 he began the publication of his famous and learned *Paléographie Musicale*, a series of photographic reproductions of mediæval manuscripts with monographs regarding the nature and interpretation of the same. In 1904 Pope Pius X issued an order that all reprints of Gregorian music appearing thereafter in the *Editio Vaticana* must conform to the versions given in the *Paléographie*. Besides this monumental work, of which 10 volumes had appeared to 1915, he wrote *L'Art grégorien* (1895), *Notes sur l'influence de l'accent et du cursus tonique latins dans le chant ambrosien* (1897), *Méthode de chant grégorien* (1899).

MODALISM. See MONARCHIANS.

MOD'DER, or KAIBA, RIVER. A left affluent of the Vaal River, South Africa, which it joins after an easterly course of 186 miles, about 31 miles above its junction with the Orange

River (Map: Cape of Good Hope, G 7). During the War of 1899-1902 its banks were the scene of much fighting and witnessed the repulse of the British troops at Maagersfontein in 1899 and the surrender of Cronje at Paardeberg in 1900.

MODELING (from *model*, from OF. *modelle*, Fr. *modèle*, from Lat. **modellus*, from *modulus*, standard, dim. of *modus*, measure). The process of preparing the original pattern or design from which a work in sculpture is to be cast or carved. Modeling is also practiced by medalists, the head or figure intended to be cut in the die being first modeled in relief with wax on a piece of slate. Goldsmiths, silversmiths, and jewelers also model intricate and artistic forms and ornaments of pieces of plate to be cast and chased by them, or in which jewels are to be set. Modeling is also a branch of the potter's trade. For large models the material employed is potter's clay, which, when used by sculptors, is mixed with a portion of sandstone, finely pulverized, to make it work freely. In painting the term "modeling" is used to denote that quality which conveys to the eye the sense of projection, volume, and bulk of an object.

MODEL YACHTING. The pastime of sailing model yachts. In England it is known as miniature yachting, under which name it was first generally practiced in America. The boats used were either exact models to scale of well-known large yachts, or of such perfection as to be capable of being built full size from the models. Departures from conventional design and new types are frequently tried out first in model yachts. Model yachting as an organized pastime is popular in Great Britain and the United States and several clubs have been formed in the larger cities to promote racing between model yachts. Model sailing yachts are usually of sloop or schooner rig and many of the modern ones are of the fin-keel type with outside lead ballast. The hulls of these model yachts are made in various ways, but are usually either shaped up from one piece of soft wood, dug out inside and decked, or are "built up" of layers of soft-wood plank, shaped to the horizontal section or plane before fastening together and then smoothed down to the sectional and profile shape, the labor of the modeling being thus lessened. These models are rigged with great accuracy and, in sailing them, they are usually steered mechanically. They sometimes have a weighted rudder, either with lead on the rudder or on the tiller, so that the former swings as the boat heels and thus counteracts its tendency to come up into the wind. Others have the main sheet attached to the tiller with a wire-spring control which returns the rudder to a fixed position when the pressure from the sheet is relieved, while some have other forms of balance gear or tillers that may be set in any desired position. They thus steer themselves on the various points of sailing. In the United States model yachts are sometimes built up to 5 feet or over in length, but are usually from 30 to 48 inches long. In regattas they are frequently handicapped according to local measurement rules. In experimental work the model department is one of the most important branches of modern shipbuilding plants, owing to the practice of "trying out" important yachts in the shape of models before proceeding with full-size construction. In this manner faults in design are discovered and remedied. Naval vessels are also usually tested out with models

in experimental tanks before building. In Great Britain model power yachting is very popular and models of various types of power boats are built from 2 to 4 or 5 feet in length, with miniature power plants (both steam and internal-combustion engines). These are operated on the small lakes and lagoons provided by the municipalities or in experimental tanks.

MODENA, mō'dā-nā (Lat. *Mutina*). A former duchy in northern Italy, south of the Po, included in the *compartimento* of Emilia in the modern Kingdom of Italy. The Roman colony of Mutina was founded on the Æmilian Way about 215 B.C., after the conquest of Cisalpine Gaul. Modena was acquired by the house of Este (q.v.) in 1288, and in 1452 the Marquis Borso d'Este was made Duke of Modena by the Emperor Frederick III. He was at the same time made Duke of Ferrara by the Pope, and the political destinies of the two cities were therefore united until 1598, when Ferrara was seized as an escheated fief by its overlord, the Pope, while Modena, with Reggio and Mirandola, remained in the possession of the house of Este. In 1796 the Duke Ercole was de-throned by Bonaparte, and Modena, with Ferrara and Bologna, was erected into the Cispadane Republic, which in 1797 was merged in the Cisalpine Republic. By the Treaty of Lunéville (1801) the Duke of Modena received the Breisgau in exchange for his duchy. On the death of Duke Ercole III in 1803 the duchy devolved by marriage upon the house of Hapsburg, the daughter of Ercole having married Ferdinand, a son of Maria Theresa, and it was awarded by the Congress of Vienna to the son of this marriage, Francis IV, who proved a cruel despot. He married Beatrice, daughter of the King of Sardinia. In 1831 an uprising forced him to take refuge in Austria, but he was promptly restored by Austrian arms, and ruled by the methods which the Hapsburg connections made familiar in all parts of Italy at that time. Francis IV died in 1846 and was succeeded by his son, Francis V. In 1848 he was forced to flee from his state, which proclaimed itself a part of the Sardinian Kingdom, but he was soon reinstated by Austria. He fled when war with Austria broke out in 1859, and although it was provided by the Treaty of Zurich that he should be restored, the people of the duchy declared their wish to be united with Sardinia in the new Kingdom of Italy. Modena then became incorporated into united Italy. See ITALY.

MODENA. A city in northern Italy, formerly the capital of the Duchy of Modena and now the capital of the province of the same name, situated in a rich gardened plain between the Panaro and the Secchia, 24 miles northwest of Bologna (Map: Italy, C 2). A navigable canal connects it with both rivers. It is a city of spacious streets and roomy arcades and is divided into an old and a new part by the historic Via Æmilia. On the main piazza rises the fine Romanesque cathedral, dating from 1099, by Lanfranco. The exterior was restored in 1893 and the interior in 1897. The façade is embellished with curious sculptures. The exterior is also enriched by a rose window and by a colonnade encircling the whole edifice. The interior is at first disappointing, but is in reality imposing. There are here a good altarpiece by Dosso Dossi and a fine group by Mazzoni. The famous Campanile, dating from 1224, is

over 300 feet high. It leans slightly. The Gothic church of San Francesco has an immense and excellent terra-cotta "Descent from the Cross" by Begarelli. The church of San Pietro is remarkable for its fine brick Renaissance façade.

Modena is rich in palaces. The Palace Albergo Arti (1767) now holds the municipal museum, containing several interesting collections. The historic library here—Biblioteca Estense, one of the most famous in Italy—had 140,740 volumes and also over 8000 manuscripts in 1913, some of them very rare. It possesses in addition a coin collection and museum of archaeology. Its picture gallery is quite well known, comprising examples by Correggio, Dosso Dossi, Guido Reni, and Velazquez. The splendid ducal palace dating from 1635 is now used for a military school. Modena has statues of Tassoni and Victor Emmanuel II. The trade of Modena is not very important. There are weekly cattle markets—grain, beef, sausages, fruit, wine, and liquors being chiefly dealt in. The manufactures are few. Linen and woolen goods, leather, hats, vinegar, glass, and pottery are produced. Silk is woven, but less extensively than formerly.

In art history Modena is known for its terra cottas. It is the seat of an archbishop and has a university, a theological seminary, a military school for infantry and cavalry, a technical institute, a technical school, an agricultural college, and an academy of fine arts. The university, founded in 1683, has three faculties and a pharmaceutical and a veterinary school. The number of students was 455 in 1913. The public gardens are lovely, and the site of the former ramparts serves as a pleasure ground. Pop. (commune), 1901, 64,843; census of 1911, 70,923. For history, see MODENA (duchy).

MODENA, GUSTAVO (1803–61). A noted Italian actor. He was born in Venice and began the practice of law, first at Bologna, then at Rome. He made his début at the latter place in 1826 and at once sprang into prominence as a tragedian. Among his greatest impersonations were those in the plays of Alfieri, and several from the French, especially the rôle of Louis XI. Political troubles obliged him to live in exile from 1831 to 1837. In the movements of 1847 his patriotism again led him to take a prominent part. He published at this time his *Dialoghetti popolari*.

MODERATOR (Lat. *moderator*, one who regulates, from *moderare*, to regulate; connected with *modestus*, discreet, *modus*, measure, and ultimately with OHG. *mezan*, *mezzan*, Ger. *mesen*, Goth. *mitan*, AS. *metan*, Eng. *mete*). A title of the presiding officer on certain occasions, chiefly academic and ecclesiastical. In the Congregational and Presbyterian churches of the United States the title of moderator is given to the presiding officer of assemblies. In the former the title is used not only in the meetings of congregations and district, State, and triennial conventions, but also in councils called to act in a judicial capacity. The presiding officers in the series of Church courts provided for in the Presbyterian system, viz., the session, the presbytery, the synod, and the General Assembly, are usually called moderators. The pastor of a local church is, ex officio, moderator of the session of the church, while in the other bodies mentioned the moderators are elected from among the presbyters. The most important function of these officers, apart from pre-

siding at the sessions of the body, is the naming of the standing committees. The term is also applied to the superintendent of the examinations for degrees and honors at the universities of Cambridge and Oxford. In the United States the presiding officer of a town meeting is also called moderator.

MODERN GREEK. See GREEK LANGUAGE (at the end). For the literature of modern Greek, see ROMANTIC LITERATURE.

MODERN INSTANCE, A. A novel by W. D. Howells (1881). Though painful in its general features, it is a graphic picture of certain phases of New England life.

MODERNISM. A term applied to opinions advanced by Catholic writers—chiefly ecclesiastics—both in Europe and America, which ran counter to traditional orthodoxy. It was an attempt to adjust religious views to the spirit of modern progress. It finally drew from Pius X an Encyclical which reprobated the doctrine as modernism and its teachers as modernists. The system is considered an outcome of the French Revolution, liberalism, and modern critical scholarship. Its advocates, in many instances men of ability and education, are not always clear in their formulas. Their tendency appears to be a denial of the objective value of the Catholic creed and a confining of its dogmas to a mere symbolism begotten of the most intimate aspirations of individual human nature. Albert Houtin, at one time a partisan, in his *History of Catholic Modernism* (Paris, 1913) says modernism may be defined as "the desire of adapting religion to the social, moral, and intellectual needs of the times; and if the word employed to designate it is not very ancient, it at least represents the eternal conflict between the spirit of progress and the spirit of inertia, between those who make of religion a formula and those for whom it is life itself." They summoned to their aid principles advocated by Kantism, pragmatism, evolution, and higher criticism. The spread of the propaganda was rapid and wide. There were champions of the new doctrine in the Old World and the New. The antichristian and anticlerical press entered the lists. Names of note subscribed to it—names such as Father George Tyrrell (q.v.), whom Houtin calls the leader, Baron Frederic von Hügel, Alfred Loisy (q.v.), and others. From 1888 until 1907 there was no general censure. Some writings had been condemned and letters of remonstrance from some cardinals and bishops were issued. In July, 1907, a decree approved by the Pope appeared; its opening words were "Lamentabili sane exitu." It contained and condemned as heretical, false, rash, bold, and offensive 65 propositions, 38 of which related to biblical criticism and the remainder to modernism. Cardinal Vanutelli on Aug. 28, 1907, wrote to bishops and superiors of religious orders demanding an immediate and rigorous suspension of professors in all educational institutions who did not conform to the decree. He moreover proscribed the reading of all publications favoring modernism. On September 6 of the same year was communicated to the whole world the encyclical of Pius X beginning with the words "Pascendi Dominici Gregis," which words are now its historical title. Modernism, it says, is a synthesis of all heresies and has affected the layman, the theologian, the historian, the critic, the apologist, and the reformer. The causes of

this novelty are put down as curiosity, pride, and ignorance of scholastic philosophy. It has broached errors concerning the inspiration, truth, and study of Holy Writ; concerning the teaching of the Church, Christology, the sacraments, the institution and organization of the Church, and doctrinal evolution. The encyclical seeks the necessary remedies and imposes a series of energetic measures and closes with a stirring appeal to the rulers of the Church. It proposes the study of scholastic philosophy, the removal of all educators imbued with modernism, the prohibition of all publications of a like nature, and the convening by bishops every two months of a Council of Vigilance whose duty it shall be to abolish everything that savors of novelty in religious matters. Naturally those indicted in the encyclical were vehement in their protestations. The general attitude seems to have been one of peaceful surrender. But Pius X had not as yet struck the final blow. It came in the shape of a decree the initial words of which are "Sacrorum antistitum." It is dated Sept. 1, 1910. It impeaches modernist obstinacy and specious cunning. It adds to the practical measures laid down in the "Pascendi." It insists upon all members of the priesthood of all ranks and upon candidates for holy orders and upon all professors in all houses of ecclesiastical training taking a solemn oath respecting modernist views and adhering to all the authoritative teaching of the Church. It is simply a profession of faith, giving assent to all articles of Catholic belief and dissenting from all the tenets in all times condemned by the Church of Rome. All who take it swear that they admit the existence of God and the demonstrability of the same by the light of natural reason; that they accept the exterior proofs of revelation, i.e., miracles and prophecies, as indubitable signs of the divine origin of religion; that they acknowledge the Church as guardian and mistress of the revealed word which was declared by Christ during his life on earth and declared really and historically; that they reject the heretical supposition of the evolution of dogma; that they deny the substituting for the deposit of divine faith confided to the Church a philosophic fiction or an evolution of human conscience susceptible of indefinite progress; that they adhere to everything contained in the encyclical "Pascendi" and the decree "Lamentabili," all relating to the history of dogma; that they do not consent to the statement that anything proposed by the Church can contradict history or be incompatible with the most authentic origin of Christianity; that they refuse to affirm that there is nothing divine in sacred tradition or if it be divine it is so in a pantheistic sense only; that they will support unto the end that the certain criterion of truth is, has been, and will be till the end in the episcopacy transmitted through apostolic succession, not, however, in such manner as to hold that which is most in keeping with the culture of an epoch, but in the sense that the absolute truth preached in the beginning must never be believed in any other meaning.

This synopsis discloses more clearly perhaps than anything else can some of the most striking declarations made by the modernists. Practically the entire Catholic priesthood subscribed to these promises. Those who refused have been dealt with severely and are outside the

pale of the Church either as suspended or excommunicated. At the present moment there are apparent no symptoms of modernism within the Roman Catholic church.

Bibliography. The best reading on the subject of modernism will be found in the *Acts* of the Roman see and notably among the documents alluded to in this article; the works of Father George Tyrrell, especially *Mediævalism* (London, 1909); also his *Autobiography and Life* (2 vols., ib., 1912); Charles Gore, *The New Theology and the Old Religion* (New York, 1908); Cardinal Mercier, *Le modernisme* (Brussels, 1908; Eng. trans., St. Louis, 1910); Joseph Rickaby, *The Modernist* (London, 1908); A. L. Lilley, *Modernism: A Record and Review* (New York, 1908); Paul Sabatier, *Modernism*, translated by C. A. Miles, Jowett lectures (ib., 1908); Newman Smyth, *Passing Protestantism and Coming Catholicism* (ib., 1908); A. F. Loisy, *The Gospel and the Church* (ib., 1909); Vermeersch, *Tractatus de Modernismo* (Bruges, 1910); J. M. Bampton, *Modernism and Modern Thought* (London, 1913); Albert Houtain, *L'Histoire du modernisme catholique* (Paris, 1913).

MODERN MACCABEES, KNIGHTS OF THE. A fraternal beneficial organization founded in 1881 for social and benevolent purposes. The organization had at the close of the year 1914 one great camp and 1290 subordinate tents or branches, with a total membership of 61,863. During the year 1914 the organization disbursed \$1,240,690, and the entire amount of benefits paid since the date of organization was \$21,590,889. This is the original order bearing this title.

MODES (OF, Fr. *mode*, from Lat. *modus*, measure, manner). The octave species in use before the time of the invention of harmony as well as during the period of the contrapuntal style up to the time of Bach. The original scale of the ancient Greeks was a *descending* minor scale with semisteps between the third and fourth and seventh and eighth degrees. Other tones than the fundamental were also taken as starting points, but the tones of the original scale remained unaltered. This shifted the position of the semisteps every time the starting tone was shifted. The combinations of tones thus obtained were regarded as separate scales and called octave species. This system the theorists of the early Middle Ages adopted, but instead of using *descending* scales they made use of *ascending* ones. At the same time they retained the original Greek names, but applied them to scales not corresponding to the original Greek scales. From among the nine octave species of the Greeks four were originally selected for the service of the Church. These were known as the *authentic modes*. Their establishment is commonly attributed to St. Ambrose, Bishop of Milan, who died in 397 A.D. Some time later—and tradition mentions St. Gregory I (Pope from 590 to 604) as their originator—four other modes were added. These were called the *plagal modes*. During the sixteenth century, when the principles of harmony began to be first understood, two more authentic with their corresponding plagal modes were added, so that the total number of Church modes was 12. Some theorists claimed the existence of two more, Locrian and Hypolocrian (one authentic and one plagal); but neither of these was ever used in actual practice. The

reason for their rejection will become apparent a little farther on. The following is a complete table of the fourteen modes:

(3) the mediant; (4) the participant. The *final* is the tone on which every melody ends. By means of this tone the mode in which any

AUTHENTIC MODES.

I Mode.	Dorian.
III Mode.	Phrygian.
V Mode.	Lydian.
VII Mode.	Mixolydian.
IX Mode.	Æolian.
XI Mode.	Locrian.
XIII Mode (or XI).	Ionian.

PLAGAL MODES.

II Mode.	Hypodorian.
IV Mode.	Hypophrygian.
VI Mode.	Hypolydian.
VIII Mode.	Hypomixolydian.
X Mode.	Hypoæolian.
XII Mode.	Hypolocrian.
XIV Mode (or XII).	Hypoionian.

(In this table the final note, corresponding to our modern tonic, of each mode is indicated by a half note, the semisteps by slurs.) It will be seen that the compass of every *authentic* mode is from the final to its octave above; that of every *plagal* mode from a fourth below to a fifth above the final. Every *authentic* mode has its corresponding *plagal* distinguished by the prefix *hypo* (under), and beginning a fourth below the authentic mode. Furthermore, every mode must be considered as consisting of two series of tones forming either a pentachord or a tetrachord in such a manner that the highest tone of the lower series is at the same time the lowest tone of the higher series. In the authentic modes the first five tones constitute the pentachord, the last four the tetrachord. In the plagal modes the tetrachord comes before the pentachord. The former arrangement is called by the eminent theorist Zarlino (q.v.) *harmonic division* (*divisione armonica*); the latter arrangement, *arithmetical division* (*divisione aritmetica*). In examining the above table it will be noticed that the pentachords and tetrachords of all the modes, except the Locrian and Hypolocrian, exhibit the compass of a *perfect fifth* or *fourth*. In these two modes the pentachord represents the compass of a *diminished fifth*, the tetrachord that of an *augmented fourth* (*tritonus*). Both these intervals were strongly condemned by musical theory, and hence these two modes were rejected as impure, and therefore impracticable.

In every mode four notes have a special significance, just as the tonic, dominant, and subdominant have in our modern scales. These notes are: (1) the final; (2) the dominant;

melody is written is determined. If it moves within the range of the final and its octave, the mode is authentic; if it moves below or above the final, the mode is plagal. The *dominant* of every authentic mode is found a fifth above the final; of every plagal mode a third below the dominant of its corresponding authentic mode. The only tone which can never serve as a dominant is B. Whenever B would occur C is substituted for it. The reason for this change is that B always forms a dissonant interval with F, either an augmented fourth or a diminished fifth. The *mediant* derives its name from the fact that in the authentic modes it always lies midway between the final and the dominant; it is always the third tone of the mode. In the plagal modes the position of the mediant is rather unsettled, owing to the necessity of obtaining a convenient tone for cadences, as in the case of the dominant, and for the same reason B can never appear as a mediant. C is invariably substituted. The *participant* in the authentic modes lies either between the final and the mediant, or between the mediant and the dominant. If, however, two notes lie between the mediant and the dominant, either tone may serve as the participant. In the plagal modes the participant is always the same as the dominant of the corresponding authentic mode. Since each plagal mode begins a fourth below its corresponding authentic, this dominant (participant of the plagal) is the same as the lowest tone of the plagal mode. Here, again, B is barred and C substituted. Likewise F can never be participant, the next higher tone (G) being substituted.

While every melody must end upon the final,

it may begin upon any one of the four just-mentioned tones. But any phrase except the last of a melody may also end upon these tones. Hence they are also called *cadences* or *modulations*. As in a long melody a feeling of monotony would be produced by the constant employment of these modulations, two or more tones are admitted. The final, dominant, mediant, and participant are called *regular* modulations and the additional tones *conceded* modulations. One of the most frequent of these conceded modulations is the seventh tone of the mode. This always appears an octave lower than the true pitch, on account of a license permitting the extension of every authentic mode by one tone below its final and of every plagal mode by a sixth above the final. In order to bring melodies within the range of certain voices it sometimes happens that they are written a fourth higher or a fifth lower than the regular mode. Such transposition is always indicated by a B flat in the signature. In these cases the true final will be either a fourth below or a fifth above the closing note.

According to their range melodies are classed as *perfect*, *imperfect*, and *superfluous*. A perfect melody moves within the range of the mode in which it is written; an imperfect melody does not exhaust the entire range; a superfluous melody exceeds the range either above or below. Some melodies exhaust the complete range of both the authentic and its corresponding plagal mode; these are said to be written in a *mixed mode*. See GREEK MUSIC; PLAIN CHANT; and for an explanation of the two modes in use at present, see MAJOR; MINOR.

MODESTO. A city and the county seat of Stanislaus Co., Cal., 77 miles south by east of Sacramento, on the Tuolumne River and on the Southern Pacific Railroad (Map: California, D 5). It has some manufactures and a trade in grain, fruit, wool, live stock, alfalfa meal, hay, and dairy products, being located in a productive region, the fertility of which is developed by an elaborate system of irrigation. The courthouse, public library, and county hospital are fine structures. Modesto adopted the commission form of government in 1912. The city owns its water works. Pop., 1900, 2024; 1910, 4034.

MODICA, mō'dê-kâ. A city in the Province of Syracuse, Sicily, 33 miles southwest of the city of Syracuse, in the fertile and beautiful valley of the river Mauro. It is 1445 feet above the sea (Map: Italy, E 6). There are a public library, a hospital, an infant asylum, a Gymnasium, technical schools, a technical institute, and a theatre. The chief products are cattle, wine, grain, oil, and tropical fruits. Pop. (commune), 1901, 48,962; 1911, 55,924.

MODIFICATION OF TEMPO. See TEMPO.

MODIL/LION (OF. *modillion*; *modiglione*, Fr. *modillon*, from It. *modiglione*, *modillion*, from Lat. *modulus*, model). An ornamental bracket much used in classic architecture, especially in the cornices of the Corinthian and Composite styles. It is so called only when used in a long series—not singly—and is usually small. Larger and single brackets are called *consoles*.

MODIOLOIDES, mō'di-ô-loi'dêz (Neo-Lat. nom. pl., from Lat. *modiolus*, nave of a wheel + Gk. *eidōs*, *eidōs*, form). One of the very earliest fossil clams known, found in rocks of Lower Cambrian age. See FORDILLA; PELECYPODA.

MODIOMORPHA, mō'di-ô-môr'fâ (barrel-

shaped; from *modio*, an abbreviation of Lat. *modiolus*, the nave or hub of a wheel, and Gk. *μορφή*, *morphē*, form, shape). A group of pelecypods similar in aspect to the recent *Mytilus*, of which they are the Paleozoic prototype. The fossil Modiomorpha are extremely abundant in the Devonian rocks, especially of North America. See PELECYPODA.

MODJESKA, mō-jēs'kâ, HELENA (1844-1909). A noted actress, of Polish origin, who after 1876 resided in the United States. She was the daughter of Michael Opido, a musician, and was born in Cracow, Oct. 12, 1844. Married in 1860 to a manager named Modrzejewski, from the contraction of whose name comes that by which she is known, she became in 1865 the leading actress in the theatre of her native city. Her husband died in 1865 and three years later she was married to Count Bozenta Chlapowski and became the star of the Imperial Theatre of Warsaw. Political difficulties and ill health led her in 1876 to go with her husband and others, including Henryk Sienkiewicz, to California, where they established a Polish colony. This did not succeed, and after only a few months' study of English the Polish Countess made her debut in San Francisco (July, 1877) as Adrienne Lecouvreur. She won a surprising success, and was soon seen in New York in the same play. In 1880 she made her London debut in the part of Camille. In 1889 and 1890 she starred with Edwin Booth, with whom she had already in 1883 appeared in *Romeo and Juliet*. Her most notable impersonations were of Shakespearean characters, among them Ophelia, Rosalind, Viola, Imogen, Cleopatra, and Lady Macbeth; but she was also famous as Mary Stuart, and appeared with success in modern plays. Her great natural gifts gained her as a tragic actress a foremost rank upon the American stage, despite the fact that she never used English with ease. In May, 1905, she was given a farewell benefit in New York City at the Metropolitan Opera House. She then settled in Orange County, in southern California, and died April 8, 1909. She was buried at Cracow, Poland. Consult: R. W. Gilder, in Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (New York, 1886); McKay and Wingate, *Famous American Actors of To-Day* (ib., 1896); L. C. Strang, *Famous Actresses of the Day in America* (Boston, 1899); William Winter, *The Wallet of Time*, vol. i (New York, 1913); and above all, *Memories and Impressions of Helena Modjeska: An Autobiography* (ib., 1910).

MÖDLING, mōd'ling. A town and favorite summer resort of Lower Austria, situated at the foot of the Wienerwald, 10 miles southwest of Vienna (Map: Austria-Hungary, E 2). It has a fifteenth-century church, a military academy, a girls' school, and an agricultural school with courses in brewing and horticulture. The manufactures consist of iron products, railway supplies, boilers, sash and blind work, cartons, lacquer, and shoes. Pop., 1900, 15,304; 1910, 18,067.

MO'DOC. A small but warlike and aggressive tribe, formerly ranging about Lower Klamath Lake and Lost River, and on the extreme northeast frontier of California. The name is said to mean 'aliens' (i.e., enemies), having been given by some one of the neighboring tribes. They call themselves *Maklaks*, 'people,' and with their northern neighbors, the Klamath,

whose language they speak and with whom they originally formed one tribe, are classified as a distinct linguistic stock known as Lutuamian. At some earlier period they seceded from the parent Klamath tribe and established themselves on Lost River. Their houses were round log structures, covered with earth, and their women were expert basket weavers and cradle makers. The Modoc made no alliances, but were at war with all the weaker surrounding tribes, and carried on a regular slave trade by selling their captives to the Columbia tribes in exchange for ponies. They came into early collision with the California immigrants, and a chronic warfare was inaugurated, marked by wholesale massacres on both sides. In 1850 they were severely defeated by troops under Captain Lyon. In 1852 they massacred a number of settlers, for which terrible retaliation was made by a band of miners under the notorious Ben Wright, who invited their warriors to a feast and peace conference and treacherously murdered 41 of the 46 who responded. Although thus diminished by nearly half their fighting force, the Modoc recommenced the war of extermination, which continued until 1864, when they entered into a treaty by which they agreed to go upon the Klamath reservation in Oregon. By this time they had been reduced to about 250. Finding their position there intolerable by reason of the persecution and insults of the Klamath, who considered them as rebels, the majority under a younger leader known as Captain Jack (q.v.) left the reservation and returned to their old home on Lost River. They were induced to return on promise of protection, but finding themselves again subjected to the same persecution without official redress, they returned to Lost River, leaving only about 100 behind under the old hereditary chief Skonchin. Orders were given to the troops to bring them back, and on Nov. 29, 1872, the final Modoc war was begun by a night attack on Captain Jack's camp. The Modoc retreated to the Lava Beds, just across the line, where they so intrenched themselves in the labyrinth of volcanic rocks that 400 regular troops were twice forced to retire with heavy loss without being able to come near enough even to see one of their concealed enemies. A peace commission to confer with the hostiles was then appointed, consisting of General Canby, Rev. Dr. Thomas, and Indian, Superintendent Meacham. They met the head men of the Modoc on April 11, 1873. Jack repeated his demand to remain on Lost River and, on Canby's refusal, drew his revolver and shot him dead. At the same moment the other warriors fired, killing Thomas instantly and severely wounding Meacham, but were driven off before they could finish the work by the arrival of the troops whom Canby had kept hidden within easy reach. The war was continued under General Davis until the hostiles were finally starved out and compelled to surrender two months later. A part of the surrendered hostiles were returned to their kindred on the Klamath reservation, Oregon, while the rest were transported to the Quapaw reservation in Oklahoma. Those on the Klamath reservation now number 212, and are apparently fairly prosperous and advancing and coalescing with the Klamath. Those on the Quapaw reservation number 33, having decreased about one-half since the removal. See KLAMATH.

MO'DRED. The nephew of King Arthur.

Tennyson represents him ambitious to gain the throne, and after revealing Guinevere's unfaithfulness to the King, he stirs up a revolt, during which Arthur is slain.

MODUGNO, mò-dōō'nyō. A town in the Province of Bari delle Puglie, Italy, 5 miles southwest of Bari. It has a twelfth-century Renaissance church and markets fruit. Pop. (commune), 1901, 11,885; 1911, 11,784.

MODULATION, in Music (Lat. *modulatio*, from *modulari*, to regulate, from *modulus*, dim. of *modus*, measure, manner). The process of changing from one key to another within the same composition. In a movement of even the smallest dimensions monotony would result if the composer should confine himself strictly to one key. There are two kinds of modulations—*passing* and *final*. Passing modulation introduces chords belonging to other keys only incidentally and soon returns to the original key. But when a piece modulates so that the original key is abandoned and a new key takes its place the modulation is final. In the sonata form (see SONATA) the first development of the principal subject confines itself only to *passing* modulations. A *final* modulation occurs at the entrance of the secondary subject (generally to the dominant key). The second or development section is concerned entirely with *passing* modulation. But even here the choice of keys is not arbitrary. However, no rules can be given; the artistic and aesthetic instinct of the composer is the sole guide. According to the theory of the present day, all modulation is regarded in its relation to the principal key of the piece, and, in a wider sense, all keys are but steps within the unlimited domain of tonality (q.v.). Older composers are very sparing and careful in the use of modulation, but those of the nineteenth century (especially Wagner, Schumann, Chopin) practically removed all barriers. The means of modulation are various and cannot be discussed in an article like the present. The most frequent expedient is the different interpretations put upon the same chord. Thus the chord c, e, g may be conceived as tonic of C, dominant of F, subdominant of G, etc., and consequently can be used to modulate at once to those keys. In modern music the chord of the diminished seventh plays an important part in modulation. Thus c♯, e, g, b♭ leads into D minor; the same chord conceived as e, g, b♭, d♭ into F minor; as g, b♭, d♭, f♭ to A flat minor; as a♯, c♯, e, g into B minor, etc. Consult: F. Dräseke, *Anweisung zum kunstgerechten Modulieren* (Freienwalde, 1876); H. Riemann, *Systematische Modulationslehre* (Leipzig, 1887); id., *Harmonie und Modulationslehre* (ib., 1900); S. Jadassohn, *Die Kunst zu modulieren* (ib., 1890). See HARMONY.

MODULE (Fr. *module*, from Lat. *modulus*, small measure). In architecture, a conventional unit of measurement for determining the proportions of the various parts of a building, especially of the classic orders. Vitruvius (iv, 3) divides a hexastyle Doric front, e.g., into 44 modules; a tetrastyle into 28; the lower diameter of the column then measures two modules, the height of the column 14 modules, and so on. This scheme was undoubtedly derived from late Greek writers. The writers of the middle and late Renaissance, first in Italy and later in France, delighted in designing individual versions of the classic Roman orders

and in formulating for each of these a minutely detailed canon of proportions based upon modules divided into "parts." Thus, Vignola (q.v.), taking the lower semidiameter of the shaft as his module, divided this into 12 parts for the Tuscan and Doric orders and 18 for the other orders. Palladio and some French writers divided the semidiameter module into 30 parts for all the orders. The module of Perrault was one-third the diameter. Jomard adopted as a module for Egyptian architecture one-tenth the height of the column. Prof. W. R. Ware simplified Vignola's scheme by taking the diameter as the module divided into six parts. See ORDERS OF ARCHITECTURE.

MODULUS (Lat., small measure). A term variously used in mathematics. In the theory of logarithms (q.v.) it designates the multiplier by which one system of logarithms is transformed into another. The expression $\sqrt{a^2 + b^2}$ is often called the modulus of the complex number $a + bi$, where i stands for $\sqrt{-1}$. (See COMPLEX NUMBER.) In the theory of numbers the term congruence (q.v.) is applied to an equality in which we neglect certain quantities which are called moduli; e.g., $26 \equiv 12 \pmod{7}$ denotes that 26 is congruent to 12 to the modulus 7, i.e., that $26 - 12$ is a multiple of 7, or that the remainder found in dividing 26 by 7 (i.e., 26 with the multiples of 7 neglected) is equal to the remainder found in dividing 12 by 7, this remainder being 5 in both cases. See CONGRUENCE.

MODULUS OF ELASTICITY. See ELASTICITY.

MOE, mō, JÖRGEN (ENGBRETSSEN) (1813-82). A Norwegian poet, folklorist, and bishop. He was born at Hole in Ringerike, and before his entry at the University of Christiania became well acquainted with Asbjørnsen (q.v.), later his collaborator. From 1835 to 1852 hardly a year passed during which Moe did not make a long tour of the country in search of popular legends. The first collection of these tales, edited by Moe and Asbjørnsen under the title *Norske Folkeeventyr*, appeared in 1842-44, was republished by Moe in 1852, and was translated into English by Dasent (1859). His *Samlede Skrifter* (2 vols., 1877) include popular poems (1849) and the juvenile stories, *I Brønden og i Kjærnet* (1851). Moe died at Christiansand, where he had been Bishop for seven years. Consult J. B. Halvorsen, *Norsk Forfatter-Lexikon*, vol. iv (Christiania, 1896), and Henrik Jæger, *Illustreret norsk Literaturhistorie*, vol. iii (ib., 1896).

MOE, LOUIS MARIA NIELS PEDER HALLING (1859-). A Danish illustrator and etcher, born near Arendal, Norway. He studied at the Academy of Copenhagen and under Tuxen. He is best known for his illustrations of Saxo's *Krønike* (Winkel-Horn's translation), of Sagas, and of many books for children. To a number of his illustrations he himself wrote the text, such as *Langt, langt bort i Skoge* (1904). After 1900 he interested himself also in etching, and published collections of fantastic pictures from fairy tales and from animal life, among them *Dyrefabler* (1909).

MOE, (INGEBRET) MOLTKE (1859-1913). A Norwegian folklorist, born at Krødsherred in Ringerike, son of Jørgen Moe. He studied theology and the history of religion at the University of Christiania and then took up the

study of comparative folklore. After 1876, when he became collaborator with P. Chr. Asbjørnsen, he went through the country on a government stipend, collecting traditions. In 1886 he was appointed professor of the Norwegian native language and of popular traditions, later also of Old Norse, at the University of Christiania. A learned and remarkably cultured man, Moe performed a real service in the field of folklore. He contributed to numerous periodicals and was a collaborator in many important literary enterprises. As an educational expert he was much consulted by the government. He revised several editions of Asbjørnsen's and Moe's *Folkeeventyr* and of Asbjørnsen's *Huldre-eventyr*. Among his own publications are: *Norske Fornkvæde og Folkevisur* (1877); *Ten Norske Folkeviser* (1899); *Retskrivning og Folkedannelse* (1900), a valuable work. Consult J. B. Halvorsen, *Norsk Forfatter-Lexikon* (Christiania, 1885-1908).

MOEL, moil (Welsh, hill). A hill having a rounded outline in its upper portion because the summit is protected from rapid denudation by a layer of soil and a growth of forest trees or grass or by marshes of peat. Consult Marr, *The Geographical Journal* (London, 1901).

MOELLER, mē'lēr, HENRY (1849-). An American Roman Catholic archbishop, born at Cincinnati, Ohio, where he studied at St. Xavier's College in 1863-69. He was then a student in Rome, where he received the degree of D.D. from the Propaganda in 1876. He held a pastorate at Bellefontaine, Ohio, in 1876-77; was professor at Mount St. Mary's Seminary in 1877-79; and served as secretary to Bishop Chatard, of Indianapolis, in 1879-80. From 1880 to 1900 he was secretary and chancellor of the archdiocese of Cincinnati; then served as Bishop of Columbus in 1900-03; and was promoted to Coadjutor Archbishop of Cincinnati, where he became Archbishop in 1904 and was invested with the pallium in 1905.

MÖEN, mē'en. A Danish island in the Baltic Sea, separated from Seeland on the northwest by the Ulv Sound and from Falster on the southwest by the Grön Sound (Map: Denmark, F 3). Area, 82 square miles. Pop., 1901, 14,504; 1911, 14,127. Its surface is remarkably irregular compared with the rest of Denmark. The limestone formation which underlies a large part of the country here crops out in the form of high and steep chalk cliffs of great natural beauty. The soil is very fertile. Agriculture and fisheries are the leading industries. The chief town and seaport is Stege, on the west coast, with a population in 1911 of 2250.

MÆRÆ. The Greek name of the Fates. See PARCÆ.

MÆRIS, mē'ris (Lat., from Gk. *Μαῖρις*, *Moiris*), LAKE. The ancient name of a sheet of water in central Egypt, a remnant of which, it is generally agreed, exists in the present Birket Karun or Birket el Kerun (lake of horns), 34 miles long by 4½ miles wide, extending along the northwestern borders of the Province of Fayum (Map: Egypt, C 2). Classical writers have left confused descriptions of a great artificial reservoir at this locality for storing the water of the Nile and irrigating the surrounding country by means of sluices. As the lake is at present 130 feet below the level of the sea, it must, within historic times, have hollowed out its bed 200 feet, or the artificial lake must have been a small reservoir southeast of it, or else the an-

cients must have totally misrepresented the whole matter. The investigations of Major Brown, which have been fully confirmed by Petrie, seem to point to the last-named solution. The lake formed by the Bahr Yusuf (Joseph's Canal) must have been much larger, until the kings of the twelfth dynasty, and later the second Ptolemy, diked off considerable portions. The semimythical King Mæris of Herodotus is Amenemhat III, the builder of the Labyrinth (q.v.), whose two colossi have been discovered at Biahmu. Consult W. M. Flinders Petrie, *Hawara, Biahmu, and Arsinoë* (London, 1889).

MERITHERIUM. A very generalized fossil mammalian type, the most primitive known ancestor of the Proboscidea. It was about the size of a tapir and is found in Upper Eocene deposits of the Fayum, Egypt. It was a sub-aquatic animal, and its chief resemblance to the elephants was the enlargement of the same front pair of teeth as those constituting the tusks of the modern elephants; the structure of the grinding teeth showed them to be essentially ancestral to those of *Palæomastodon* (q.v.). Other parts of the animal exhibit analogies to the primitive sea cows or sirenians.

MOERO, mwā'rō, MOERO-MKATA, or MWERU. A lake in south Central Africa, situated 100 miles west of the south end of Lake Tanganyika. (Map: Congo, Belgian, E 4). It lies on a plateau at an altitude of 3000 feet and is surrounded, especially on the north, by wooded mountains having an alpine aspect. It is 68 miles long, 24 miles wide, and its bottom slopes gradually downward towards the north, where depths of 40 feet are registered. An extensive swamp, 30 miles long, at the south end marks the former extent of the lake. It is evidently of great age, as it contains a remarkable species of fish belonging to the Silurian period and of amphibious habits. The Luapula River enters the lake at the southern end and leaves at the northern end to join the Congo. The lake was discovered in 1867 by Livingstone. The settlement of Rhodesia was founded on its eastern shore in 1892.

MÆSIA, mē'shī-ā (Lat., from Gk. *Μαίσα*, *Moisia*). An ancient Roman province, bounded by the Danube, and for a short distance by the Savus (Save) on the north, the Black Sea on the east, the mountain chains of Hæmus (Balkan) and Orbelus on the south, and the range of Scardus and the river Drinus on the west (Map: Rome, E 2). The river Cibus (Tzibritza) divided it into two parts, of which the eastern (Mæsia Inferior) corresponded approximately to the present Bulgaria and the western (Mæsia Superior) to Servia. Its original inhabitants were mostly of Thracian race. Gaulish or Celtic invaders settled in western Mæsia about 277 B.C., under the name of Scordisci. The Romans first came in contact with the tribes of Mæsia after the conquest of Macedonia. In 75 B.C. C. Scribonius Curio, proconsul of Macedonia, forced his way as far north as the Mæsiæ and gained a victory over the Mæsiæ, but the country was not completely subjugated till 29 B.C. It was made a Roman province in the reign of Augustus and flourished for more than two centuries; but as a frontier province it was much exposed to hostile invasions and required a line of fortresses and stations all along the south bank of the Danube and a wall from Axiopolis to Tomi. The chief Roman towns were Viminacium in Mæsia Superior, and Istros, Marcianopolis, Nicopolis,

and Tomi (to which Ovid was banished) in Mæsia Inferior. In 250 A.D. the Goths (q.v.) made an irruption into the country and defeated and slew the Roman Emperor Decius in the following year, and about the end of the fourth century it was given up to them by the Emperor Theodosius I. (See MÆSO-GOTHS.) Slavic tribes settled in Mæsia in the sixth and seventh centuries, and towards the close of the seventh century the Bulgarians established their kingdom in the eastern part. Consult S. E. Stout, *The Governors of Mæsia* (Princeton, 1911).

MÆSO-GOTHS, mē'sō-gōths'. A name given to the Goths who, early in the third century, settled in Lower Mæsia, at the mouth of the Danube. (See MÆSIA.) In the fourth century they were converted to Christianity through the efforts of Ulfilas, who translated the Bible into their dialect. (See ULFILAS.) The name Mæso-Goths is applied especially to those Goths who remained in Mæsia after the great migrations early in the fifth century. See GOTHS.

MOFFAT, DAVID HALLIDAY (1839-1911). An American banker and railroad builder, born at Washingtonville, Orange Co., N. Y. He became a bank messenger in New York City in 1854, a bank clerk at Des Moines, Iowa, in 1855, and then clerk and cashier in a bank at Omaha. In 1860 he went by prairie schooner to Denver. During the Civil War he made several large shipments of gold bullion to the East. In 1866 he became cashier, and shortly afterward president, of the First National Bank of Denver, in which capacity he served until his death. He was president of the Denver and Rio Grande Railroad in 1884-91, built the Florence and Cripple Creek Railroad largely at his own expense, and was interested in more than 100 mines in Colorado.

MOFFAT, ROBERT (1795-1883). A Scottish Congregational missionary to South Africa, born in Ormiston, Scotland. In early life he was a gardener, but having made the acquaintance of some Wesleyan ministers, he determined to engage in religious work and sought to qualify himself to be a missionary. He was accepted by the London Missionary Society and set apart for the ministry in 1816, was appointed to South Africa, and arrived at Cape Town early in 1817. He proceeded to Namaqualand and to the kraal of Africaner, a savage chief, who was converted and became an earnest Christian. The country, however, did not prove well adapted for the location of a mission centre, and Moffat, after having explored a considerable region, established the station of Kuruman in 1825. His missionary labors were very successful and productive of great benefits in the amelioration of the character of the people and the development of civilization. In 1859 a new centre was established among the Matabele at Inajati. The missionary labors of Dr. Moffat and his travels and adventures are described in his book, *Missionary Labors and Scenes in South Africa* (1842). During 1839-43 he visited England and then returned to Africa and remained there till 1870, when he went back to England and settled in Brixton, London, where he spent the rest of his life. In 1873 he was presented with the sum of £5800 in recognition of his great services. His wife (Mary Smith), whom he married in 1819, shared in all his missionary labors, and his daughter Mary became the wife of David Livingstone (q.v.). Besides the volume already men-

tioned, Dr. Moffat published *Africa, or Gospel Light Shining in the Midst of Heathen Darkness: A Sermon on Faith* (1841) and *Rivers of Water in Dry Places: An Account of the Introduction of Christianity into South Africa, and of Mr. Moffat's Missionary Labors* (1863). He also translated the Bible into the language of the Bechuanas. The full account of Moffat's life and labors is given in the *Lives of Robert and Mary Moffat*, by their son, John Smith Moffat (London, 1885; popular ed., 1889).

MOFFATT, JAMES (1870–). A British biblical scholar. He was born in Glasgow and was educated there in the academy, university, and Free Church College. He was ordained to the ministry of the Free church in 1896, was Jowett lecturer in London in 1907, and left his church at Broughty Ferry in 1911 to become Yates professor of Greek and New Testament exegesis at Mansfield College, Oxford. He translated (1904–05) Harnack's *Expansion of Christianity*, edited "Thessalonians" (1908) and "Revelation" in the *Expositor's Greek Testament*, and wrote: *The Historical New Testament* (2d ed., 1901); *George Meredith, a Primer to the Novels* (1909); *Paul and Paulinism* (1910); a valuable *Introduction to the Literature of the New Testament* (1911); *The Theology of the Gospels* (1912), being lectures delivered at Glasgow; a new version of the New Testament (1913); *Expositor's Dictionary of Poetical Quotations* (1915).

MOFFETT, CLEVELAND (LANGSTON) (1863–). An American journalist and author, born at Boonville, N. Y., and educated at Yale, where he graduated in 1883. From 1887 to 1892 he was connected with the *New York Herald*, for four years on the European staff and for a year on the New York staff. In 1893–94 he was foreign editor of the *New York Recorder*. Magazine work then engaged him for a time, but he returned to the *Herald* as Sunday editor (1908–09). In the meantime, and subsequently, novels and plays came from his pen: *Real Detective Stories* (1898); *Careers of Danger and Daring* (1901); *A King in Rags* (1907); *The Battle* (1909); *The Bishop's Purse* (1913); and the plays: *Money Talks* (1906); *Playing the Game* (1907); *The Battle* (1908); *Greater than the Law* (1912). He also translated Bourget's *Cosmopolis* (1894).

MOGADOR, mög-a-dör', or SUERA. The principal seaport of Morocco, situated on the Atlantic coast, 120 miles west-southwest of the city of Morocco, of which it is the port (Map: Africa, C 1). It is built on a rocky promontory, surrounded on the land side by sand dunes. A channel between the town and a neighboring island forms the harbor. Mogador is the best-built town of Morocco, having been planned by a French engineer in 1760. A part of it, the Kasbah or castle, is surrounded by walls and contains the residences of the Moorish officials and of the protected Jewish and Christian merchants. Most of the Jews, however, live in a separate quarter of the city. Its equable climate renders it a health resort which is becoming increasingly popular with European sufferers from tuberculosis. The trade of the city is considerable and is mostly with Great Britain and France. The principal exports are olive oil, almonds, gum arabic, hides, goat skins, and wool. The city occupies the site of a much older town. In 1844 it was bombarded by the French. Pop., about 22,000, nearly half of whom are Jews.

MOGILA, mo-gē'lā, or **MOGILAS, PETER** (c.1597–1647). A Russian theologian. He was born in Moldavia, of a noble Wallachian family, and was educated at the University of Paris. After serving in the Polish army he went into a monastery at Kiev and became metropolitan of that see in 1629. He set up a printing press and founded an academy and a library, to which he gave his own collection of books. He published a catechism in 1645 and other minor works. His great title to fame rests upon the *Confession of Faith of the Greek Church*, which was drawn up at his instance by the Abbot Kosslovski of Kiev, approved at a provincial synod in 1640, and accepted by the patriarchs of Constantinople, Jerusalem, and Antioch in 1642–43 and by the Synod of Jerusalem in 1672. It has been edited in Greek and Latin by Panageotes (Amsterdam, 1667) and Hoffmann (Leipzig, 1695). A German translation by Frisch appeared at Frankfurt in 1727. It is given by Von Kimmell in *Libri Symbolici Ecclesiae Orientalis* (Jena, 1843).

MOGK, mök, EUGEN (1854–). A German philologist, born at Döbeln, in Saxony. He was educated at the University of Leipzig; worked in 1879–80 in the libraries of Copenhagen, Stockholm, and Upsala; and became a teacher in the Leipzig Realgymnasium in 1883 and professor of Norse philology at the University in 1893. He edited the *Altnordische Saga-Bibliothek* (1891 et seq.) and *Altnordische Texte* (1886–90). To Paul's *Grundriss der germanischen Philologie* he contributed important monographs on the literature of Iceland and on Germanic mythology. He also wrote *Die deutsche Sitten und Bräuche* (1907) and *Das Menschenopfer bei den Germanen* (1909).

MOGOK, mö'gök. The capital of the District of Ruby Mines, Upper Burma, India, 36 miles east of Irrawaddy (Map: Burma, C 2). The town lies in a valley at an altitude of 4000 feet above the sea. It is a collection of 9 villages and is the headquarters of the ruby mines of Burma, which are controlled by the Ruby Mines Company, a European enterprise which has introduced complete modern mining equipment with hydroelectric power furnished by the Yeni stream. Pop., 1901, 6078; 1911, 11,069.

MO'GONTI'ACUM. The Roman name of Mainz.

MOGUL', GREAT (more correctly *Mughal*, or *Moghul*; Hind. *Mughal*, from Mongol *Mongol*, Mongol, from *mong*, to be brave). The popular designation of the Emperor of Delhi as the impersonation of the powerful empire established in Hindustan by the Mongol conqueror, Baber, the great-grandson of Timur, in 1526. The most important princes of this line, after Baber (the first Great Mogul), who died in 1530, were Akbar (1556–1605), Jehangir (1605–27), Shah Jehan (1628–58), and Aurangzebe (1658–1707). In 1803 the Great Mogul, Shah Alam II, was deprived of his throne, and in 1827 he surrendered even the appearance of authority, becoming a pensioner of the British. In 1857 Mohammed Bahadur, the last of the dynasty, who had been invested with the Imperial dignity at Delhi at the outbreak of the Sepoy Mutiny, was condemned for his complicity in the mutiny and transported to Rangoon, where he died in 1862.

Bibliography. H. G. Keene, *History of the Mogul Empire* (London, 1888); Stanley Lane-Poole, *History of the Mogul Emperors* (ib.,

1892); Horn, *Das Heer- und Kriegswesen der Grossmoguls* (Leyden, 1894); E. S. Holden, *The Mogul Emperors of Hindustan* (London, 1895); Haidar, *History of the Moguls of Central Asia* (ib., 1898). The *Bábar-Náma*, or autobiography of Baber, was published by Beveridge (London, 1905), while Mannucci's *Storia do Mogor*, or *Mogul India, 1653-1708*, has been translated by Irvine (3 vols., ib., 1906-07).

MOGULESKO, SIGMUND (1858-1914). A Jewish-American actor, born in the Province of Bessarabia. When he was nine years old, his musical talent was discovered by a famous cantor visiting the town. After several years of early training Mogulesko entered the Bucharest Conservatory of Music, and at 14 was already intrusted by the local cantor with the leadership of a choir of 20 voices, besides performing a similar function in an opera chorus. Six years later, with the opening of a Jewish theatre at Bucharest (the first of its kind in the world), his desire to go on the stage was realized. For seven years he played in Russian, Rumanian, and Galician cities, and in 1885, when Jewish theatricals were forbidden in Russia, settled in the United States. Mogulesko, though a character actor, was essentially a comedian. His art was spontaneous, not studied. He was undoubtedly one of the greatest Jewish actors since the founding of Jewish theatres. He composed some *entr'acte* music, which has been frequently played in New York theatres.

MOGYORÓSSY, mög'yô-rôs'i, ÁRKÁD (1851-). A Latinist, better known as Arcadius Avellanus. He was born at Esztergom, Hungary; learned Latin as a child, finishing his education in Hungary; and, having come to the United States, was editor and publisher in Philadelphia (after 1894) of the *Præco Latinus* (or *Latin Herald*), a Latin periodical for promoting the adoption of this language for speaking. Mogyoróssy's publications include: *Palæstra: A Primer for Spoken Latin* (1893-1915); *Arena Palæstarum* (1893); *Robinson Crusæus* (1897); *Medulla* (1898); *The Colloquia of Maturinus Corderius, the Teacher of John Calvin* (1904); *Fabulæ Tusculanæ* (1913); translations into Latin of Ruskin's *King of the Golden River* (1913) and of *The Adventures of Captain Mago* (1914), an account of an imaginary journey of a Carthaginian sailor to Spain.

MOHÁCS, mó'hách. A grand commune and market town in the County of Baranya, Hungary, on the right bank of the Danube, 23 miles east-southeast of Fünfkirchen (Map: Hungary, F 4). It is poorly built, but is a railway junction point and an important station for steamers. It manufactures silk, lumber, and bricks and is the centre of the coal trade of the Fünfkirchen district. It is noted as the scene of the battle of Aug. 29, 1526, between the Hungarians under Louis II and the Turks under Solymán the Magnificent. The King and 24,000 Hungarians and Germans perished, and a large part of Hungary fell under the yoke of Turkey. On Aug. 12, 1687, a second battle was fought at Mohács, in which the Imperialists under Charles of Lorraine defeated the Turks, thereby putting an end to the Turkish dominion in central Hungary. Pop., 1900, 15,832; 1910, 17,092.

MO'HAIR (OF. *mouhaire*, *mouaire*, *mohere*, Fr. *moire*, from Ar. *mukhayyar*, fabric of goats' hair). The wool of the Angora goat (see GOAT) of Asia Minor and South Africa. Few animals

have so beautiful a covering as the fine, soft, silky, long, and usually pure white fibre of this goat. Each animal at the annual clip in April or May yields from two pounds to four pounds of wool. The fabric *mohair* made from this wool is characterized by its light weight, smooth, dust-shedding surface, and lustre. In pile fabrics, such as plushes and astrakhans, mohair is sometimes used for the pile warp, while the body is made of cotton. The fabric known as camel's hair is made from the best mohair, which enters into the manufacture of many fabrics. Mohair is used as a substitute for human hair in switches and wigs. Consult "The Angora Goat," *United States Department of Agriculture, Farmers' Bulletin*, No. 137 (Washington, 1901). For the production of mohair in the United States, see WOOL.

MOHAM'MED (Ar. *Muhammad*, praised, approved, or endowed with praiseworthy qualities). The founder of Islam. It is not certain whether Mohammed was his original name or a cognomen given him in the latter part of the Meccan period. Some scholars, among them Huart (*Histoire des Arabes*, p. 90, Paris, 1912), think that his proper name has remained unknown, or possibly was Kutham. Others, like Nöldeke (in *Der Islam*, p. 160, Strassburg, 1914), maintain that Mohammed was his real name. If reliance can be placed upon the statements that he was about 63 years old when he died, the traditional date of his birth, 570 A.D., would be approximately correct. But tradition also connects his birth with "the year of the elephant." The march upon Mecca by Abrahā, the Abyssinian ruler of Yemen, at the instance of Justinian, who was at war with Khosrau I, must have occurred before 562. It is therefore doubtful when the prophet was born. His birthplace was undoubtedly Mecca. He was the son of Abdallah, of the family of Hashim, and Amina, of the family of Zuhra. There is no reason to doubt that both belonged to branches of the powerful tribe of the Koreish. His father, a poor merchant, seems to have died before Mohammed was born; and his mother, following the custom of her tribe, is said to have given the child to Halima, of the tribe of the Banu Sa'd, that she might nurse him in the healthful air of the desert. A few years afterward his mother died. His grandfather, Abd al Muttalib, adopted the boy; and when the grandfather died, Mohammed's uncle, Abu Talib, a man of influence, though poor, took him into his house and remained his friend and protector as long as he lived. Concerning Mohammed's youth we have no trustworthy information. It is probable that he was about 25 years of age when he entered the service of a rich widow named Khadija, who was also of the Koreish, and accompanied her caravans, perhaps as a camel driver, to the fairs. In these travels he is said to have met a Christian monk, Nestur, and this is likely to be true. Whether his journeys took him to Syria, to Hira, and to Yemen cannot be determined with certainty, but is not improbable, and Nöldeke suggests that he may have been even to Abyssinia. Khadija, who was older than Mohammed and twice widowed, offered him her hand, which he accepted. It was a happy marriage. As long as she lived he took no other wife. According to tradition, she bore him three sons, al Kasim, al Tahir, and al Tayyib, and four daughters, Zainab, Ruqayya, Umm Kulthum, and Fatima. Kasim died before Mohammed's

prophetic ministry began. Al Ṭahir and al Ṭayyib are probably fictitious names. The daughters grew up, but only Fatima seems to have left any issue. Mohammed conducted Khadija's business with success and his surname al Amin (the faithful) seems to indicate the high esteem in which he was held for his integrity and good judgment.

The story of Mohammed's life from the time when the first revelations came to him until the emigration to Yathrib (Medina) is better known than that of his youth and early manhood, but is still very obscure and full of uncertainty, both as to the events and circumstances and in regard to the inner development. There are indeed numerous suras, or chapters, of the Koran that unmistakably come from this Meccan period, extending perhaps from 610 to 622 A.D., and it is even possible to distinguish between an earlier and a later group among these suras. These oracles, which in the main, no doubt, have come down to us in their original form, are invaluable testimonies, but do not yield much information concerning the succession of events or the growth of Mohammed's prophetic consciousness, and contain many allusions that cannot be understood without knowledge drawn from other sources. The collections of tradition (*hadith*), the early biographies (*ṣira*), and the exegetical elucidations in the commentaries on the Koran (*tafsir*) have been widely used as such extraneous sources; but the searching analysis of the *hadith* by Goldziher and the more recent investigations of the *ṣira* and the *tafsir* by Lamens (see HADITH) have led many eminent scholars to assume a more radical position than heretofore. A cautious and circumspect criticism must manifestly seek to steer its way between a skepticism tinged with prejudice and a generosity touched with apologetic interest to a purely historical viewpoint. While in a certain sense it still may be said that Islam is the only great religion born in the broad daylight of history, there are many serious obstacles in the way of securing a conception of Mohammed's life based throughout on well-authenticated facts and of securing a fair and carefully considered estimate of his character.

Vague and inadequate as our knowledge is concerning the undercurrents of religious life among the Arabs in the period immediately before the appearance of Mohammed, we are not wholly without evidence as regards some of the tendencies that prepared the way for the great prophetic movement. While the Arabian Jews mentioned in Acts ii. 11 may have come from Arabia Petraea, it is certain that the Jewish tribes Kainuka, Nadir, and Kuraiza had been settled in Yathrib long before the immigration of Mohammed, other settlements existed at Khaibar, Fadak, and Taima, and in Yemen there were Jewish colonies as early as the fourth century A.D., and a Jew, Yusuf dhu Nuwas, reigned in Saba 520-525 A.D. Through the Abyssinian conquests in Yemen Christianity spread into Nejran, and in the north the Ghassanids were at least nominal Christians. From Egypt and Syria Jews and Christians came as slaves or as merchants to Mecca. The Aus and the Khazraj in Yathrib seem to have come from Yemen, and Mazdaism is likely to have become known there through Sassanid influence before Christianity came in with the Axumites. Even the Sabians, or Mandaans, on the lower Euphrates, are likely to have been known to the Lahmids in Hira and

the Arabs employed by them. The poets seem to have been especially subject to the foreign impact. Every *kahin* (diviner) or *sha'ir* (knowing one) cannot of course be supposed to have sung altogether after the fashion of the Moallakat (q.v.), and it must be remembered that the remnants of pre-Islamic poetry have been copied by Moslem hands; but the reticence about local divine names and the use of a neutral expression like Allah (*al ilahu*, 'the god,' 'the deity') by the great poets may be original and not wholly due to expediency on the part of singers called upon to recite their poems to Jewish and Christian audiences, but to some extent to a broadened outlook. The poems of Umayya ibn Abu'l Salt, recently collected, edited, and translated by Schultess (Leipzig, 1911), obviously composed for the edification of Arabs in the time of ignorance, and not intended for Jewish or Christian ears, reveal indeed such a familiarity with biblical lore that it is not impossible that they were one of the sources of Mohammed's knowledge. Although it is extremely difficult to sift the tradition as to the *hanifs*, two facts seem to be well established: the name was for some reason given to such men as Waraka ibn Naufal and Zaid ibn 'Amr who, without being either Jews or Christians, were opposed to polytheism and idolatry, and Mohammed himself used the term of Abraham as a worshiper of one god and not an idolater, as well as of his own followers, the Moslems. In Hebrew the word *hanif* designates a wicked, impious, godless person, an apostate from the faith; in Aramaic it acquired the special sense of heretic; in Arabic it may also have carried the meaning of one fallen away from the ancestral faith and practice or inclining to a monotheistic belief, the term of reproach becoming one of special honor on the lips of the prophet. There were, no doubt, many such *hanifs*, obscure forerunners of Mohammed in Arabia.

It was possibly about 610 A.D. that Mohammed began to be disturbed by certain experiences that came to him. As the result, apparently, of a physical malady he had hallucinations, he heard strange sounds as of the ringing of great bells, a voice seemed to speak to him, a spirit sought to take possession of him. At first he appears to have conceived of this spirit as a *jinn*, and of himself as called to become a poet, a seer, a diviner, as so many others. The tradition of such an original conception lived long at Mecca. But he gradually seems to have become impressed with the idea that it was no ordinary *jinn* producing poetic inspiration whose voice he heard, but that of "the faithful spirit," "the spirit of holiness." Later this being was identified as Gabriel. We have no means of determining which is the earliest of the suras. But the opening words, though not the whole, of Sura xvi may well claim to represent one of the oldest of Mohammed's recorded revelations. These words have sometimes been translated "Read, in the name of thy Lord." But there can be little doubt that they should be rendered "Recite (or proclaim), in the name of thy Lord." That the revelations came through the ear is the unanimous testimony of Moslem tradition; and Suras lxxv, 16 ff.; xx, 113; xxv, 34 clearly show that the process of revelation includes a reciting from the heavenly book by the spirit and repetition of what he has heard by the prophet. This has been emphasized by

Snouck Hurgronje and Nöldeke, and most recently in a very convincing manner by Pedersen (in *Der Islam*, Strassburg, 1914, pp. 110 ff.). Mohammed does not seem to have known how to read and write, but he knew how to proclaim in a very impressive manner what he was convinced that he had heard. The elevated prose he employed, approaching poetry in its rhythmic swing, its assonance, and frequent rhyme, naturally produced the impression upon those to whom he confided his visions that he was a poet inspired by a *jinn*.

It was only after inner struggles, testifying to the genuineness of his ecstatic experiences, that he thus revealed what had happened to him even to his wife Khadija, his friend Abu Bekr, and his cousin Ali, who encouraged him by their confidence. That he was receiving revelations from the heavenly book naturally created in him the conviction that he had been chosen by his Lord as an instrument to make known to his people the contents of this book, as others had to other nations, and that the message sent down to diverse persons at different times must be essentially the same, as it came from the same source, which could contain no contradictory statements. He consequently identified himself with an order of messengers to whom he counted not only Abraham, Moses, and Jesus, but also Hud, who was sent to Ad, and Salih, who was sent to Thamud, and others. It may not have been until he left Mecca that he assumed definitively such titles as *al nabi* (the prophet) and *rasul Allahi* (the messenger of Allah). His message did not centre about himself, but about Allah, and not so much about his nature as about his authority, his righteous demands, the inevitability of his judgment, and his mercy to those who believe his messengers. Allah's rights are based upon the fact that he is man's creator. Through some channel, possibly a physician, Mohammed had obtained a knowledge, unusual in his age, of embryogeny. In view of this constantly recurring wonder of man's embryonic development, he found it easy to believe in a re-creation of man in the resurrection of the dead. The purpose of this resurrection could only be a judgment upon man's earthly life, the sentence to eternal punishment in hell or the acquittal and gracious gift of eternal life. With deep earnestness he realized the terrible danger of man's plight, the need of divine guidance, and the wonderful mercy of Allah. To his quickened moral sense it became clear that the issues of life depend upon the line of conduct that is followed. He looked with horror upon many practices prevalent in the community, such as murder, theft, adultery, exposure of female children, cruelty to women, dishonesty in trade, lying, usury, oppression of the poor, luxury, gluttony, and drunkenness; and he believed that only by a surrender of self to Allah (*islam*), by abandoning idolatry and seeking in prayer and meditation, after the fashion of the *hanifs*, to be guided aright, by encouraging one another to patience and well-doing, and by acting justly and mercifully, would it be possible to lead a life acceptable to Allah. As for himself, he had no further duty than to announce his message, to warn and exhort; he had no right to use force. Having been an orphan and poor himself, he could sympathize with those who were neglected and ill treated; having been honored by his Lord, he proclaimed, with fear and trembling, yet with unmistakable gratitude and

love, what came to him in moments of trance and ecstasy. How genuine these experiences were may be judged from the fact that the oracles sometimes contained rebuke of himself—his pride and indifference in turning away a beggar, his unseemly eagerness for revelations, his failure at times to distinguish between the voice of the spirit and that of the devil. There is no reason to doubt that after reciting the words "Have you seen al Lat and al Uzza, and that other, al Manat, the third idol?" (Sura liii, 19 f.), he once added: "These are the exalted princesses, and their intercession is desired" (Tabari, I, 1192, 1195), but later announced that he had been reproached by the spirit for having uttered these words, by consequence of which they have disappeared from our present text of the Koran.

While the accounts of persecutions may be exaggerated, there can be no question that much disapproval was expressed, much mockery was indulged in, and occasionally violence was resorted to by the unbelieving Koreish. Finally the family of Hashim seemed to have been forced into the part of Mecca called "the ravine of Abu Talib." This application of the principle of the Ghetto may have been dictated by fear of evil consequences to the community from Mohammed's blasphemies against gods and goddesses, or from the free association of men of different clans who had the same religious opinions which manifestly threatened the tribal organization, as well as by resentment because of what seemed like personal abuse, the consignment of their parents to hell, and an attack upon their prestige and revenue. A considerable number of the Moslems emigrated to Abyssinia, where they were well received by the Negus. Some of these returned many years later, some became converts to Christianity, and some, at least temporarily, relapsed into paganism. It was probably exclusion from the Ka'ba that caused that strange experience of the Prophet when, whether in the flesh or out of the flesh he probably did not himself know, he was carried away in a night to Jerusalem. Neither his enemies who laughed at him, nor Abu Bekr who vouched for the accuracy of his description, nor he himself, probably, could tell what actually happened; and we do not know whether Mohammed ever was in Jerusalem. Three years the boycott lasted; then a compromise was effected. But after the death of Khadija, about 619, and of Abu Talib, a little later, Mohammed naturally sought for other allies and protectors, and he first attempted to reach the tribe of Thakif at Taif. When this proved to be in vain, and his uncle Abu Lahab refused to protect him, he at last entered into negotiations with the pilgrims who came to Mecca from Yathrib, some of whom had come under the influence of his teaching. The invitation to Mohammed to become the political and religious head of Yathrib did not come as the result of a town meeting, but of a conspiracy. There was no plebiscite, but there is likely to have been a secret agreement between the local Moslems and some of the more eminent leaders of the Aus and the Khazraj and possibly also of the Jews. An oath of allegiance was given by the conspirators on behalf of the Banu Kaila at the second meeting of Akaba, near Mecca; and Mohammed then undertook to remove some 150 of his followers from Mecca to Yathrib. He remained in the city himself until the last of the emigrants had left; then he

cautiously picked his way, together with Abu Bekr, to his new home.* After his arrival in Yathrib he sent to Mecca for his wife Saud and his daughters. There is no evidence of any effort on the part of the Koreish to prevent this departure. It was not a flight from persecution, but a deliberate removal, a voluntary emigration, as the word *hijra* implies. As to the date, it is certain that it occurred in the month of Muharram, 622 A.D.; but the calendar instituted 17 years later by Omar begins the year on the first of Muharram, i.e., fifth of July, which may or may not have been the date of Mohammed's leaving Mecca.

Concerning Mohammed's life in Yathrib, which now becomes known as *Medinat al nabi* (the city of the prophet) or simply *al Medina*, we are better informed than in the case of any other period of his career. There are indeed many gaps in our knowledge; many legends formed especially about his last illness and death; the stories of his domestic troubles have no doubt been colored in transmission by the prejudices and interests of rival factions; and some of the letters said to have been dictated by Mohammed may be suspected of being fictitious. But we possess a very important document in the treaty of Mohammed and the emigrants from Mecca with Yathrib, a kind of charter of the new community, preserved by Ibn Hisham (ed. Wüstenfeld, pp. 341 ff.) and translated by Wellhausen (*Muhammads Gemeindeordnung von Medina*, Berlin, 1889). The bulk of the correspondence of Mohammed preserved by Ibn Ishak, al Wakidi, and Ibn Sa'd, and translated by Wellhausen (*Ibn Sa'd, die Schreiben Muhammads und die Gesandtschaften an ihn*, Berlin, 1889), is no doubt genuine. Poems by enemies like Ibn Zibā'ra and Umayya ibn Abū'l Salt copied by Moslem historians are of distinct value. The historical character of accounts of defeat and of dishonorable deeds calling for an apology cannot well be questioned; and the excellence of early Arabic historiography is quite remarkable.

The emigration to Medina brought with it a notable change in the Prophet's position. He became the civil head of a community. This *umma*, or community, consisted of the followers of Mohammed, called Koreish, *muhajiruna* (emigrants), or *ashab* (companions); further, the Banu Kaila, i.e., Khazraj and Aus, made up of believers called *ansar* (helpers), and others spoken of as *munafikuna* (doubters, vacillating ones), and various Jewish tribes considered as clients of the Banu Kaila. The "emigrants" broke their natural tribal relations in Mecca and entered into a fictitious brotherhood (*huwa*) with the Yathribine "helpers." In the new charter Mohammed was referred to as "the Prophet." It was therefore unavoidable that the community became a theocracy: not a hierarchy, however, under foreign rule, as Judæa in the Persian period, nor a government by a priestly ruler, like the Hasmonæans, but an independent state whose civil and religious life is ordered by divine oracles that come through a prophet, resembling to some extent the theocracy of Florence in the days of Savonarola's power. This must be borne in mind if Mohammed's activity in Medina is to be understood and his character fairly judged. At Medina he became more fully acquainted with Judaism, and probably in a measure also with some form of Christianity. He sought to gain the Jews, and

at first made some notable converts; but he laid himself open to ridicule by maintaining that he knew that certain things could not be in the Law of Moses, but must be falsely ascribed to the legislator, since they did not agree with the revelations he had received from the heavenly book. In this he betrayed ignorance, but not insincerity, as the insistence by good men upon absolute harmony between all divine oracles is of very common occurrence in all religions. Allah could not contradict himself.

It became a serious question how much contradiction, mockery, and blasphemy his prophet, now responsible for the order and welfare of the community, should endure in patience. His disappointment in not seeing the Jews in larger numbers embracing Islam may have led him to change the *kibla* (see KIBLAH), or direction in prayer, from Jerusalem to Mecca, though it would not be strange if, entirely apart from this, a conviction should have grown up in his mind that the Ka'ba, purged from idolatry, would be the most acceptable temple of Allah on the earth. Neither was he quite certain how far the rules and conventions of the period of ignorance were still binding upon Moslems. At first he hesitated to justify the infraction of the customary month of truce; later he minimized the guilt by magnifying the sin of those who had rejected Allah and driven out his people. The problem whether a state, and he as the head of a state, had the right to engage in war probably never occurred to his mind, either in a trance or in a waking condition. The Koreish of Mecca were the enemies of Medina; they had made themselves the enemies of Allah. In the battle of Bedr in February, 624, they were defeated by a small band of Moslems. Allah had given them victory, though the Koreish had greatly outnumbered them. Similarly, Mohammed is not likely ever to have considered whether the *lex talionis* could be set aside altogether, or even whether private blood revenge, the law of the desert, could be abolished. When, as the result of a quarrel, one of the Banu Kainuqa, a Jewish tribe, had been slain by the Moslems, and these had in turn killed the murderer, revenge for the Moslem was sought. The Kainuqa fortified themselves, were besieged by the Moslems, and finally forced to emigrate to Syria, their property being confiscated and given to the Muhajira, who thus were freed from their dependence upon the Banu Kaila.

At Ohod, in 625, Abu Sufyan and the Koreish gained a victory over the people of Medina. The Prophet was wounded and had to hide himself. When this misfortune was laid up against him by the "doubters" and some of the Jews of the tribe of al Nadir as a sign that he was not a true prophet, Mohammed gave indeed counsels of moderation to his zealous followers, and knew how to change the defeat into a moral victory by explaining that the cause of the disaster was the lack of faith in Allah, but he did not forget the attitude of the al Nadir; and when they refused to furnish their share of money needed as compensation for a case of manslaughter by error, their palm trees were ultimately cut down and they were driven out of Medina. Mohammed unquestionably did much to improve the conjugal relations of his people, by abolishing *mota* marriages contracted for a brief period, punishing adultery, forbidding fornication, limiting the number of wives to four, regulating divorce, insisting upon the rights of wives, and protect-

ing children. It is significant that, when one of the tribes indicating its willingness to accept Islam sought to secure a concession in favor of fornication, he refused with indignation to accede to their request. But his growing conception of holding a unique position in Allah's favor led him to feel that Allah would grant him exceptional privileges. Unselfish and abstemious, he asked little for himself in other respects, but his excitable erotic nature made large demands upon divine clemency and generosity. He not only increased the number of his wives beyond that permitted by Allah to others, but also took to himself Zainab, the wife of his adopted son Zaid ibn Harith, whom he had surprised in the bath. Zaid promptly offered to divorce her; Mohammed hesitated, but received a general dispensation covering all such cases; and Zainab afterward tried to poison him, proudly giving her reasons for this act. The suras of the period hint at many domestic troubles, which are more or less accurately explained by the tradition. His sensitiveness to ridicule also made him miserable and led him to countenance the removal of offending poets through zealous Moslems, if not to incite feuds by which he could get rid of them.

In 627 "the war of the trenches" broke out. The Banu'l Nadir had found a refuge in Khaibar, but longed for revenge, and entered into a coalition with the Koreish, the Banu Sulaim, and the Banu Ghatafan. With something like 5500 men they marched against Medina. The city seemed to be doomed, as it had no wall, and the buildings could be united for defense only on one side, while the others were altogether open. Then a Persian slave, Salman al Farisi, suggested the idea of digging a trench. Such a device was called in his language, the Pahlavi, *kandaqa*. The siege lasted about a month. Mohammed made peace with the allies of the Koreish, and these returned to Mecca without having accomplished anything. While the war was going on there were diplomatic conversations between the Koreish and the Banu Kuraiza, the last important Jewish tribe in Medina. These demanded hostages of the Koreish, which they refused to give. The matter came to the attention of Mohammed, who besieged them for 25 days. When they finally surrendered without condition their men were to be executed and their women sold into slavery, though it is doubtful whether the sentence was actually carried out. Successful raids were then made in various parts of Arabia.

In 628 Mohammed desired to make a pilgrimage to the Ka'ba. He started with a large number of followers, and encamped in the plain of Hudaibiya. From there Othman was sent as an ambassador to deal with the Koreish, who had come out in large numbers ready for battle. He secured a treaty of peace for 10 years, and the right for Mohammed and the Moslems to hold possession of the city of Mecca and the Ka'ba for three days the following year, with the duty of returning Koreishite fugitives. Not realizing the advantages gained, but deploring their return without booty, the Moslems were dissatisfied with this treaty of Hudaibiya. Mohammed, therefore, sent them against the Jewish city of Khaibar, which they captured and plundered. The pilgrimage was made the following year (629) by 2000 Moslems, and made so strong an impression in Mecca that two of the leading generals of the Koreish, Amr and Khalid, soon

appeared in Medina and embraced Islam. It is possible that, when the news reached Arabia of the defeat and expulsion of the Persians by Heraclius, Mohammed sent a message to the Byzantine Emperor calling his attention to the prophecy he had made several years before of this victory of the Greeks (Sura xxx, 1 ff.), and that his messenger was slighted. There can be no reason to doubt that he dispatched a messenger to the Ghassanid King at Bosra, Amr al Harith, for the murder of this ambassador led to the expedition into the east Jordan country which ended in the ignominious defeat at Muta in September, 629. The letters said to have been sent to Khosrau Parvez, the Sassanid King, and to the Negus of Abyssinia, as well as the answers, may be spurious, but the fact that embassies were dispatched can scarcely be doubted. The Mukaukis of Egypt, possibly the head of the Coptic church, must have received a message, since he sent him several female slaves, one of whom, Mary, bore him a son, Ibrahim, who died at the age of 18 months. Haudha ibn Ali, King of Yemama, proposed a peaceful division of Arabia between them, which Mohammed declined; al Mundhir, the Lahmid King at Hira, received a message from him. On the other hand, he also received many deputations from different parts of the peninsula seeking alliance with him. In 630 a quarrel between the Koreish and the Khuza'a, who were in alliance with Mohammed, was construed by him as a breach of faith on their part, and justified him in "cutting loose from the idolaters" (Sura ix, 1 ff.). He marched against Mecca in January, 630, with an army of about 10,000 men. Abu Sufyan was sent to discover Mohammed's design; he went over to Mohammed's side, and when he returned to Mecca presented the situation in such a light that the city capitulated. As it was impossible to allow the victors to pillage the city, which had not been defended, Mohammed imposed upon it a war indemnity, levying large sums from the richer citizens. He proclaimed a general amnesty from which only 10 were excepted, among them two female singers who had chanted derisive songs about Mohammed. Abdallah ibn Sa'd, who had been Mohammed's secretary in Medina, transcribing his revelations, but had been accused by the Prophet of reproducing them inaccurately, had renounced Islam and fled to Mecca. He was now an apostate and deserved death, but was finally pardoned after long and earnest efforts on the part of Othman. Abdallah's return to his ancestral faith may have been due to a too intimate acquaintance with the manner in which the later revelations came and were reproduced. While Mohammed in Medina never seems to have doubted his mission or lost the sense of being inspired, as did Savonarola after the fateful decision in the case of the Medici, the nature of these later discourses is such that it is extremely improbable that, as a rule, they were the result of ecstatic experiences like those of the Meccan period. He was no doubt subject at times to similar trance-like conditions; and occasional signs are not wanting of the power, originality, and freshness characteristic of the earlier days. But in the main these suras show by their length, monotonous repetition, shrewd wording, careful elaboration, and flowing style that they are homilies rather than oracles, apologies for the faith and practice of the Prophet rather than inspired utterances.

Medina remained the residence of Mohammed and the capital of the state even after the capture of Mecca. The adhesion of new tribes enlarged this growing empire. Taif was besieged and taken. There are grave doubts about some of the details of the reported campaign against Tabuk, but the expedition itself is certainly historical. In 632 Mohammed determined to make the pilgrimage to Mecca. He had performed the *'umra*, or pious visit, possible at any time of the year, before, but now for the first time he undertook, at the head of many thousand Moslems, the formal pilgrimage, with its holy rites, the procession around the Ka'ba, the run between Safa and Merwa, the visit to Mount Arafat, where he laid down the laws and ordinances concerning the pilgrimage, the meditation during the night at Muzdalifa, the stoning of the devil in the valley of Mina, the sacrifice, the shaving of the head and cutting of the nails, and the drinking from the well Zemzem. (See ARAFAT; HAJJ; KAABA.) He was apparently conscious that his work was done; for after many exhortations to his followers to protect the weak, the poor, and the women, to abstain from usury, and to live a righteous life, he is said to have closed his prayers with the words: "Oh, Allah! Have I not completed my mission?" to which the people answered: "Yea, Allah." Soon after his return to Medina he was taken ill with pleurisy. But neither the remedies tried, such as the pouring of water over him and the injection of medicine in Abyssinian fashion, nor the care given him, in eager and loyal, even though not wholly unselfish, rivalry, by Ali and Fatima on the one hand and Ayesha, Abu Bekr, and Omar on the other, could help him, and he died on Monday, June 8, 632 (13th Rebi' I, 11 A.H.) in the arms of Ayesha, and was buried in her house Tuesday night. His death created a serious situation, as he had not indicated his wish, or Allah's will, in reference to a successor. While Ali's claims were urged in the council by Talha and Zubair, he undertook himself, as the nearest of kin, the embalming and burial of the Prophet; through Omar's influence Abu Bekr was chosen as Caliph (*khalifa*), "representative" of, or "substitute" for, Mohammed.

Mohammed is described as of middle height, lean, but broad-shouldered, with a well-developed head and somewhat curly hair. His eyes were large and black, his nose was prominent, slightly aquiline, and finely formed. He wore a long beard, which added to the dignity of his appearance. A black mole between his shoulders became known among Moslems as the "seal of prophecy." He is praised for his amiability, his loyalty to friends, his frequent readiness to forgive an enemy, his tenderness towards his family, his great generosity, his kindness to the poor, his care of orphans, the simplicity of his domestic life. Even after his removal to Medina he lived in simple quarters, mended his own clothes, and freed all his slaves. He had himself refrained from the use of wine and strong drink long before he imposed total abstinence upon his followers, for military reasons, in order to improve their discipline and fighting qualities. He shared with his men the hardships of warfare, though his physical bravery was never quite equal to his moral courage. He had the defects of his qualities. His remarkable practical sagacity and shrewdness sometimes degenerated into cunning and deceit. The ex-

traordinary intelligence which enabled him, the unlettered camel driver, to produce a literature also permitted him at times to indulge in disingenuous apologetics. His keen sensibilities and rich gifts of imagination made him occasionally irritable, melancholy, suspicious, and revengeful. With his deep earnestness he could not understand those who trifled or acted the part of hypocrites; the enemies of Allah became his enemies. The more convinced he became that his inspiration differed from that of the poets and the diviners, that he was possessed by a holy spirit and not by a *jinn*, the more horrible, blasphemous, and unendurable seemed to him the mockeries of those Jewish and pagan poets who made his life so bitter. The affectionate nature, strongly rooted in the life of the senses, which for many years had found its full satisfaction in Khadija's love, after her departure sought for gratification in many directions, but he may not have been conscious of any inconsistency between Allah's permitting all believers to have four wives and his graciously granting the Prophet a few more, and from his knowledge of what he considered Allah's revelation to the Jewish people he did not gather that there was in the heavenly book a prohibition of polygamy as such, nor is there any evidence that he was familiar with the views of Jesus on the subject. From his fundamental conception of the process of revelation followed, not only the recognition of Judaism, Christianity, and Sabianism, i.e., Mandaism, as permitted religions, and toleration of those who professed them as the *ahl al kitab* (the people of the book), the recipients of a revelation from the heavenly book, but also suppression of paganism as a *religio illicita*, and the *jihād*, or holy war, against idolaters, not accounted worthy of such a revelation. The very conviction that he had been intrusted with a message to his people and to mankind, was indeed a prophet like those who had been sent in earlier times, and as the latest of the prophets the one to whose voice his contemporaries were especially bound to listen—a conviction that has influenced the world profoundly during thirteen centuries—evidently tended to produce in his own mind the idea that he held an exceptional position among the sons of men, involving peculiar duties and compensating privileges. With all his serious limitations and aberrations, the essential sincerity of his nature cannot be questioned; and an historical criticism that blinks no fact, yields nothing to credulity, weighs every testimony, has no partisan interest, and seeks only the truth, must acknowledge his claim to belong to that order of prophets who, whatever the nature of their psychical experience may have been, in diverse times and in diverse manners, have admonished, taught, uttered austere and sublime thoughts, laid down principles of conduct nobler than those they found, and devoted themselves fearlessly to their high calling, being irresistibly impelled to their ministry by a power within.

Bibliography. The life of Mohammed by Ibn Hisham (ed. Wüstenfeld, Göttingen, 1858-60) was written on the basis of the biography by Mohammed ibn Ishak; Ibn Sa'd's biography has been published by Mitwoch (Leipzig, 1905); Wakidi's history of Mohammed's campaigns was edited by Kremer (Calcutta, 1856) and an abbreviated translation was published by Wellhausen, *Muhammed in Medina* (Berlin, 1882); Baladhuri's book on the conquests was edited by

De Goeje (Leyden, 1863-68); Yakubi's history was edited by Houtsma (Leyden, 1883); Bukhari's *Sahib* was edited by Krehl (Leyden, 1867-68); and Abu'l Feda's life of Mohammed was translated into French by Houdas and Marçais (Paris, 1903). A vast collection of the material will be found in L. C. Caetani, *Annali dell' Islam*, vols. i-vi (Milan, 1908-13). Among Western writers on the life of Mohammed the following should be mentioned: William Muir, *Life of Mahomet* (London, 1851-61; new ed., rev. by T. H. Weir, Edinburgh, 1912); Theodor Nöldeke, *Das Leben Muhammed's* (Hanover, 1863); G. Weil, *Das Leben Muhammeds* (Stuttgart, 1864); St. Hilaire, *Mahomet et le Coran* (Paris, 1865); Aloys Sprenger, *Des Leben und die Lehre des Mohammads* (Berlin, 1861-65; 2d ed., 3 vols., ib., 1869); C. L. E. Krehl, *Das Leben Muhammeds* (Leipzig, 1884); August Müller, *Der Islam im Morgen- und Abendland* (Berlin, 1885); William Muir, *Mahomet and Islam* (London, 1887); Julius Wellhausen, *Skizzen und Vorarbeiten*, vols. iii, iv (Berlin, 1887-89); I. Goldziher, *Mohammedanische Studien*, vol. ii (Halle, 1890); Hubert Grimme, *Mohammed* (Münster, 1892); Snouck Hurgronje, "Une nouvelle biographie de Mohammed," in *Revue de l'histoire des religions* (Paris, 1894); Lamaisse and Dujarric, *La vie de Mahomet* (2 vols., ib., 1897-98); Hubert Grimme, *Mohammed, die weltgeschichtliche Bedeutung Arabiens* (Munich, 1904); D. S. Margoliouth, *Mohammed and the Rise of Islam* (London, 1905); Fr. Buhl, *Muhammed* (Leipzig, 1906); Theodor Nöldeke, *Geschichte des Korans* (2d ed., rev. by Schwally, ib., 1909); Chauvin, *Bibliographie des ouvrages arabes*, vol. xi: *Mahomet* (Paris, 1909); C. H. Becker, *Christianity and Islam* (New York, 1909); Henri Lammens, in *Recherches de science religieuse*, vol. i (Paris, 1910); Huart, *Histoire des Arabes* (ib., 1912); Henri Lammens, *Fatima et les filles de Mahomet* (Rome, 1912); C. MOHAMMED. The name of five sultans of Turkey.—**MOHAMMED I** was the son of Sultan Bajazet I, who was defeated and captured by Timur in 1402 and died in captivity in 1403. Mohammed I, after sharing the supreme power with his brothers, became sole Sultan in 1413. He reigned until 1421. He consolidated the Empire, which had suffered from the inroad of Timur.—**MOHAMMED II** (c.1430-81) was Sultan from 1451 to 1481. He was surnamed *El-Ghazi*, i.e., conqueror (of infidels), and also *Buyuk*, i.e., the Great. He was born at Adrianople and succeeded his father, Amurath II. His first acts were the murder of his brother and the suppression of a rebellion in Karamania. Having thus secured himself on the throne, he bent all his energies in order to effect the capture of Constantinople. This city was now the sole remnant of the once mighty empire of the Cæsars, and after more than a year spent in preparations, Mohammed commenced the siege

on April 6, 1453, with an army of about 70,000 and a fleet of 320 vessels. The Greeks, aided by gallant bands under Gian Giustiniani, a noble Genoese, long maintained an obstinate resistance. On the morning of May 29 the Turks made a combined attack by land and sea without success; but the retirement from the ramparts of Giustiniani, who had been severely wounded, caused a panic among his followers, and the simultaneous charge of a chosen body of janizaries, with Mohammed himself at their head, proved irresistible. The brave Emperor, Constantine XI, died in the breach, and the Turks poured in over his corpse to plunder and devastate his capital. Mohammed now transferred the seat of his government to Constantinople, and sought to gain the good will of the inhabitants by promising them a free exercise of their religion. After achieving this great conquest, he made formidable preparations for the invasion of Hungary. Belgrade was the first point of attack; but János Hunyady (q.v.) compelled him to raise the siege (1456). Soon after this Mohammed became master of the Morea, annexed Servia, and conquered the Empire of Trebizond, an offshoot of the Byzantine Empire. He then turned his arms against the Albanians, whose leader, Scanderbeg, long defied the Turkish power. Scanderbeg died in 1468, and 10 years later the subjugation of Albania was completed. In 1470 Mohammed conquered Negropont from the Venetians. In 1475 he made the Khan of the Crimea tributary, and at the same time deprived the Genoese of Kaffa. In 1480, however, he was repulsed by the Knights of St. John from Rhodes. In the same year he captured Otranto in Italy, the last achievement of his reign. Mohammed was possessed of great abilities; he was brave, enterprising, and sagacious; he is said to have spoken five languages fluently, and to have been well versed in geography, ancient history, natural sciences, and the fine arts. But the brilliancy of his career and the occasional generosity and even magnanimity which he showed cannot obliterate the recollection of those acts of cruelty and treachery which have justly branded him as the most ruthless tyrant of the house of Osman.—**MOHAMMED III** (1566-1603) was Sultan from 1595 to 1603. He succeeded his father and at once murdered 19 brothers. He waged war against Austria without success.—**MOHAMMED IV** (1641-91) was Sultan from 1648 to 1687. He succeeded his father, Ibrahim, who had been murdered by the janizaries. The real rulers were the Kiuprili (q.v.). The reign of Mohammed IV saw the decline of Turkish power in Europe. The great onslaught upon the house of Austria in 1683 resulted in the defeat of Kara Mustapha (q.v.). After other disasters Mohammed was dethroned in 1687.—**MOHAMMED V** (1844-1918) was chosen by the National Assembly on April 27, 1909, to succeed his brother Abd-ul-Hamid II (q.v.), whom they had just deposed. Consult Stanley Lane-Poole, *Story of Turkey* (New York, 1889).

MOHAMMED ALI. See MEHEMET ALI.

MOHAMMED ALI MIRZA, a'lê mër'zâ (1872-). A shah of Persia, eldest son of Muzaffar ed Din. He received a liberal education in the English and French languages and married one of his cousins, the daughter of Prince Naïeb Saltaneh, Minister of War. In 1899 he was intrusted with the government of the most important province of Persia, that of Azerbaï-

jan. He opposed the constitution and parliamentary government established by his father for the Persian people in 1906. When Muzaffar ed Din died on Jan. 10, 1907, Mohammed Ali succeeded him as Shah. He continually quarreled with the National Council and dissolved that body in 1908. A revolution resulted; the Shah made concessions when it was too late; and on July 15, 1909, the victorious rebels compelled him to take refuge in the Russian Legation. The Council declared this to be an act of abdication and elected his son, Ahmed Mirza (born in 1895), as his successor. Mohammed Ali went into exile in the Crimea, but was granted a pension. See *PERSIA, History*, and consult the corresponding article and section in the *NEW INTERNATIONAL YEAR BOOK* for 1909.

MOHAMMEDAN ARCHITECTURE. See *ARCHITECTURE*.

MOHAMMEDAN ART. The art produced by Mohammedan nations from the seventh century A.D. to the present time; called also *MOSLEM ART*. The most flourishing period was between the ninth and fourteenth centuries, though in certain places, such as Constantinople, Cairo, Persia, and India, the golden age came later. The homes of this art have been mainly Syria, Persia, Egypt, north Africa, Spain, Asia Minor, India, Sicily, and Constantinople. The Arabs, founders and propagators of Mohammedanism, possessed none of the arts (see *ARABIAN ART*), and consequently a period of at least two centuries passed before the amalgamation of converted peoples, after tentative efforts to adapt preceding artistic forms, created the special types of Mohammedan art. This work was done especially in Syria, Persia, and Egypt, though north Africa and Spain also contributed their share. Byzantine, Persian, and Coptic artists, even if Christians, were employed at first; but finally all the branches were practiced by Mohammedans. The religious prejudice against the representation of the human figure in art, especially in sculpture, prevented any development in the large fields of figure sculpture and painting, forcing the artist into decorative work in pure line and color, in which he became the most consummate master in the whole history of art. In Persia, it is true, this prejudice was far less strong, and a national school of figure painting was developed in the fifteenth and sixteenth centuries. But the exceptions to the hostility to sculpture, which was especially an idolatrous art in Moslem eyes, are very few. Surface ornamentation became the special domain of Moslem art, whether displayed on broad architectural surfaces or on the smallest article of furniture or decoration. This ornamentation, like the forms of architecture themselves, was at first derived from Byzantine models, as in the earliest Cairo work, with a large added element of stiff floral patterns, mainly of classic origin. But gradually the invasion of purely geometrical forms almost extinguished the flora, and the system was evolved and completed in the eleventh century, which is a combination of pure geometric and arabesque designs, used with ever-increasing profusion until all surfaces were covered with it.

ARCHITECTURE

The origins of Mohammedan architecture must be studied in the mosques (q.v.). As the Mohammedans in the countries which they conquered found themselves surrounded by magnifi-

cent monuments of all the past civilizations of the East, it was natural that they should turn to them for the type of their own places of worship. The first important mosque was that erected by the conqueror Omar at Jerusalem in 637—a purely Byzantine design, possibly even a Byzantine church slightly altered. This disappeared centuries ago. The earliest mosque of any pretension now extant was that of Amru (641 A.D.) at Fostat, which consecrated the Arab conquest of Egypt. It served as a type for two centuries. Its colonnades around an open court seem to combine the plan of the atrium of a Christian basilica and the hypostyle hall of an Egyptian temple. The columns were taken from churches and arranged in numerous rows, surmounted by round or pointed arches, on which rested a flat, wooden ceiling. There appear to have been no æsthetic beauty and no decoration in this perfectly plain brick structure. It was in Syria, where the Omniad caliphs had their capital at Damascus, that the first artistic monuments were erected under Abd al Malak and his son Al Walid (c.700 A.D.). They spent immense sums on three buildings which still remain: the mosque of Damascus (705), reputed the most sumptuous monument of the Mohammedan world and built to surpass the works of Christian architecture in Syria (repeatedly altered and badly injured by fire in 1893); the Al Aksa Mosque and the Dome of the Rock, commonly misnamed mosque of Omar (691), both in Jerusalem, built to rival the church of the Holy Sepulchre. The Al Aksa was of a different type from the Egyptian mosques and more like a hall or a Christian church. The principal side of its court, called the jami, containing the mihrab and pulpit (mimbar), had a forest of 280 columns in 20 rows, and in the centre, in front of the mihrab, rose a dome. On the other hand the great Damascus Mosque was of the Egyptian type of the mosque of Amru, the type of the atrium, and had only a triple line of columns on the jami (main hall) side and a single row on the others. In both mosques the columns now support pointed arches. The courts were filled with secondary monuments, usually in the shape of domed chapels or fountains. The most important of these is the Dome of the Rock in the court of the Al Aksa Mosque. It followed the Byzantine domical type; its central dome, 112 feet high, is supported on four square piers with intermediate columns and is surrounded by two concentric aisles with eight piers and 16 columns on an octagonal plan.

The next important building in the Mohammedan world is the great mosque at Cordova, the capital of the new Kingdom of Spain. It was founded in 786, and its main hall, as it now stands after two enlargements in 876 and 976, is the largest of all mosques, measuring 534 by 387 feet and containing 856 columns in 19 aisles. Its wooden ceiling, notwithstanding this great length, is 30 feet high. The intricate effect of the maze of columns is increased by the lack of any broad and lofty central nave and by the unique arrangement of two stories of superposed horseshoe arches, as well as by the alternation of white and black marbles in the arches. The decoration shows an early form of stiff foliated arabesque in small separate compartments. The eighth century and the following witnessed a flowering of Mohammedan architecture in all provinces and in all classes of buildings: foun-

tains, baths, aqueducts, palaces, khans, bridges, caravanserais, minarets, mausoleums, monasteries and colleges, bazars and city gates, hospitals, cloisters. A large part of the revenues of the state was devoted to public works. Bagdad was built in 762 and became the capital of the caliphate. Great buildings were erected in the cities of north Africa, in Kairwan (mosque in 837), Algiers, Tlemcen, Tunis (mosque and arsenal in 742). The wonderful buildings of Bagdad, no longer extant, probably gave the keynote to the new art. Much of this early architecture and ornament betrays Byzantine origins; but gradually Persian preponderance makes itself felt through the dynasty of the Abbasides, with Bagdad as centre. The wooden roof is entirely abandoned for the dome. A purely Oriental system of ornament is invented, both geometric and arabesque. The wall surfaces, which had hitherto been left plain or ornamented in Byzantine fashion, are covered with intricate stuccoes and faience tiles, inherited from ancient Persia and Babylonia.

Egypt. Egypt remained for a while outside of this movement, probably because its architecture was still in the hands of native Christian Copts: no domes were used and brick had not yet given place to stone. The earliest mosque in Cairo was that of Amru (642), still extant, but greatly dilapidated, comprising a court, cloisters, and sanctuary. Far more magnificent was that built by Ibn Tulûn when he declared Egypt's independence (876-879). As Ibn Tulûn objected to employing Christian columns for the new mosque, his Christian Coptic architect offered to build it with piers in place of columns. This mosque is of the cloistered type, with two aisles on three sides of the court, or *sahn*, and five aisles in the sanctuary; these are formed of 160 rectangular piers supporting broad, stilted, pointed arches, such as the Copts had always employed. The entire construction was of brick stuccoed, the stucco being decorated with stiff arabesques in relief of the knop and flower pattern derived from ancient Oriental or Egyptian models. A flat wooden roof rested on the walls not far above the crown of the arches. The wall inclosing the mosque forms a court about 300 feet square. All the brilliant revetment and coloring have disappeared. Still this remains the finest example of the early type of mosque. It also has a couple of the earliest minarets, built, as were all the early ones, of brick (twelfth century). There is a small dome in front of the mihrab, as in the earlier Syrian and Palestinian mosques.

Under another dynasty another great mosque was built—the El Azhar or university mosque, in the newly founded capital, Cairo, begun in 969. Here the same cloistered plan was used, but with columns from churches in place of piers. When in 996 the mosque of El Hakim was built, however, the quadrangular pier was used as in the mosque of Tulûn; but its proportions are far slenderer and higher.

It was in the following century that Egyptian architects adopted the dome. Cairo's great characteristic is its multitude of domes. They were used mainly over funerary chapels. There now arose an important class of funerary mosques attached to royal tombs. The Egyptian rulers of the Fatimite dynasty displaced the caliphs of Bagdad as principal patrons of Mohammedan art, and the monuments of Syria, north Africa, and Sicily were inspired from

Egypt during the eleventh and twelfth centuries. Undoubtedly it was the thorough study and application of geometry by Arab writers of the schools of Bagdad and Cairo that made possible not only the scientific architecture of this period, but the wonderful system of geometrical ornament that became so much a part of it. A consistent style was finally developed, which spread over the entire Mohammedan world from Spain and Morocco to Persia, and from Asia Minor to India. The minaret towers were multiplied and began to lose their early heaviness (see MINARET) and to take on great variety of forms, and, being built of stone as well as brick, they were better adapted to a richer ornamentation. The heavy walls were crowned with delicate battlements.

Most characteristic was the invention of the stalactite motive in decoration, which was applied to every possible form of corbeling and by means of which a highly ornamental substitute was found for the Byzantine pendentive in effecting the transition from the square plan to the circular or polygonal dome. The historical tendency was ever to raise the domes higher and make them more pointed. Their numbers multiplied in the thirteenth and following centuries. The cemeteries of Cairo are full of ruined but beautiful mediæval domical tombs. The mausoleum mosques of sultans Hasan, Barkuk, Kait Bey, Kalaun, El Ghuri are the finest examples in Cairo of the domical style. Beginning with the tomb of Esh Shafi'y in 1211, passing through the stage of the tomb mosque of Es Salih in 1249, complete success was realized in adapting the dome to the mosque plan under the impetus given by the Mameluke sultans in the mosque of Hasan in 1356, where the plan is a Greek cross centring about an open court and with the domed tomb behind the mihrab. This magnificent building was regarded as unequaled in Mohammedan lands. Its proportions are grandiose; the tunnel vaults over the arms of its cross are bold. Stone and marble have definitely replaced brick. During this time, however, the type of the old cloistered mosque had been continued in buildings not connected with tombs, such as those of Bibars (1268), of En Nasir (1318), Kusun (1329), El Maridany (1339). The system of stalactite corbeling was used to fill up gaps between all different planes. Like most of Mohammedan work, it conceals under apparent irregularity and freedom, not to say vagrant fancy, the most scientific accuracy of form. The wonderful development of decorative work at this time in mosaic faience, wood carving, marble inlay, metal, etc., is noticed later in this article and in special articles.

Spain. Meanwhile other Mohammedan lands had been following the example of Egypt. The Arabo-Byzantine style of the monuments of Cordova had ruled for about two centuries; a national Mohammedan style was formed shortly before 1000, as in Egypt, as shown in monuments of Tarragona, Segovia, and especially Toledo and later in Granada and Seville. The horseshoe arch, often minutely cusped, was characteristic of this Hispano-Moresque style, together with a peculiar cubical form of capital and, above all, a system of mural decoration in all-over patterns molded or stamped in stucco and enriched with decorative inscriptions and brilliant coloring. The famous Giralda tower at Seville belongs to this middle style, while the alcázars, or Moorish palaces, at Seville (q.v.),

Segovia, and Malaga usher in the style of the Alhambra at Granada. When in 1238 Granada became the capital of the Moors in Spain, its monuments expressed the development of native arts for the ensuing century. Here is found the richest extant combination of the different kinds of surface decoration in which Mohammedan art excelled; arabesque and geometrical ornament, diaper patterns of extraordinary richness, stalactile corbeling, stucco and faïence, mosaic and marble inlay cover every inch of space. But though so rich, the ornament of the Alhambra, being largely cast or stamped, lacks the life and dignity of the freer Egyptian work of the same kind. See ALHAMBRA.

Persia. The Turks and Mongols made such havoc of the earlier monuments of Mohammedan Persia, the region of Bagdad and the great northern states of Bokhara and Samarkand, that nothing has survived in these regions of earlier date than 1300. But the following three centuries, while they show a style no longer in its early prime, produced highly interesting works in Persia and in the derived styles of other countries. The Tatars and Seljuk Turks adapted their work from Persian models, in the buildings of the thirteenth and fourteenth centuries at Sivas, Kaisarieh, Konieh, Nigdeh, Nicaea, Brusa, etc. The contemporary buildings in Persia, at Tabriz, Sultanieh, Teheran, and especially those of the Sefi dynasty at Ispahan (the Meidan, mosque of Mesjid Shah, Bazar, and Medresseh of Hosein Shah), show that Persian architecture was capable of grandiose conceptions finely executed. In Persian ornament, flowing lines were preferred to angular and geometrical designs; even its arabesques are more continuous and soft, and it hardly ever resorted to stalactile corbeling. The bulbous pointed dome is universal, and a vast niche, extending through the whole height of the façade, framed the main portal. The material of construction is brick, faced with enameled tiles of brilliant colors in minute arabesque patterns. A kind of four-centred pointed arch, somewhat like a Tudor arch, is almost universal. The minarets have circular shafts and are very slender, being topped by small domes.

India. At the same time Mohammedan art in India, which made its beginnings in the Kûtûb Minar and mosque and gate of Allah el Din and tomb of Altompsh at Old Delhi, and at Ajmere, in the thirteenth century, received a great impetus through the establishment of the Mogul supremacy (1526), and produced a style that was in many ways the grandest in the whole sphere of Mohammedan architecture. Buildings like the mosque and tomb of Mahmud at Bijapur, the mosques at Fatehpur-Sikri, Agra, and Delhi, the palace of Akbar at Allahabad, and the Taj Mahal at Agra are masterpieces. Red sandstone and marble are the chief building materials; the Taj is largely of alabaster. There is undoubtedly a dependence on the art of Persia in the shape of the pointed arches and domes and in the niche façades, but these Indian architects showed a surpassing sense of composition and effectiveness, never allowing, as the architects of Egypt and Spain so often did, the love of detail to become paramount.

Turkey. Finally, when the Turks captured Constantinople (1453), they adopted the Byzantine system of plan and construction (and specifically that of Hagia Sophia, which became their chief mosque) and superimposed upon this

a style of surface decoration which they had developed from Persian models. The architects they employed at first were Christian Greeks, but Sinan, the greatest of them all and a designer of extraordinary genius, was a Moslem. Their mosques have ever since been variations of the type of Hagia Sophia on a smaller scale. But some of them have great merit of dignity and composition and some originality in the exterior treatment, e.g., the mosque of Mohammed II, which has four semidomes grouped around the central one, and especially the Suleimanieh Mosque (1553). These have alternating white and black marbles in the interior voussoirs, and the simple brilliancy of the surfaces gives quite a different effect from a Byzantine interior. The mosques of Ahmet I (1608) and the Yeni Djami (1658), and at Adrianople the noble mosque of Selim, are works of impressive grandeur. The Turkish minaret is of stone, cylindrical, with a tall conical spire and carved galleries. For details regarding special classes of buildings and the delightful domestic architecture of the Moslems, see special articles, such as CARAVANSERAI; FOUNTAIN; BAZAR; TEKIYE; MINARET; MOSQUE.

MINOR ARTS

Decoration. The carving of the Mohammedans was purely decorative, becoming richer as the Middle Ages advanced. In the earlier stages it partook somewhat of Byzantine design, as in the mosque of Cordova and in early Egyptian and Syrian mosques. But it was then scanty and rather heavy. When the schools became more differentiated in the eleventh century, into the Persian naturalistic, figured and floral; the Syrian schematic, animal and floral; and the Egyptian, geometric and stiff floral schools, ornament began to spread over the entire building. Even the exterior surfaces of domes and walls were covered with a lacework cut in stone or stucco. Color was given by marble mosaics in Egypt, or in Syria and Persia by brilliantly colored tiles. The mosque of Omar is an early, the Alhambra at Granada a mediæval, and the mosque of Ispahan a late example. The tiles became an Oriental specialty and were imitated in Spain until recently. In Persia and in Asiatic Turkey the production of these decorative tiles is still an active craft. True sculpture, as distinguished from surface carving, is practically unknown in Moslem art, the Lion Fountain of the Alhambra offering the single notable exception. See AZULEJO.

Woodwork and Ivory. In no style of art has so varied an artistic use been made of wood. Where other styles have used stone and marble we find wood used, e.g., in carved ceilings, windows, pulpits, lecterns, screens, latticework, doors, balconies, parapets, tomb casings. In the richest pieces ivory and mother-of-pearl are sometimes used in connection with wood, being either inlaid in carved panels or being set as panels in wooden frames. Wood was used not only for the furniture of the private house, but for that of the mosque, such as cupboards, tables, and the classes of work mentioned above. Some of the best examples of floral design in Egypt are preserved in wood carvings. The most magnificent pieces are probably the pulpits, such as that of Kait Bey in South Kensington Museum, and the panels from those of Maridany, Lagin, and Kusun in the same museum. The

panels of the hospital of Kalaun show a Persian style of figures and animals rather than the floral and geometrical patterns. The reading platform of the mosque of Kait Bey is a fine instance of marquetry and ivory, largely in polygonal design. Ebony and ivory were often combined in mosaic-like patterns, sometimes framed in strips of metal, as in jewel cases and other boxes. But the most extensive of all the wood carvings and inlaid work were the ceilings of mosques and palaces, as in those of Kait Bey, El Moyyed, and El Bordeini.

Metal Work. The Persians, Syrians, and Egyptians were skillful workers in metal. Perhaps the earliest centre was in Mesopotamia, at Mosul. Brass, bronze, and copper were chiefly used. While chiseled bronze and repoussé copper seem the earliest processes, the works came to be often inlaid with silver and sometimes with gold by different processes: (1) by incrusting a thread of gold or silver into an undercut groove; (2) by inclosing a metal strip or plate between raised walls; (3) by pressing a thin leaf of metal into stipple marks. The entire metal surface was excavated according to the elaborate design, the edges undercut, the threads or plates of gold or silver inserted and burnished, and then the surfaces chased with all the details that could not be given by the general outlines. Animals, birds, human figures, hunting scenes, feasting scenes, and other genre subjects, as well as floral designs, characterize more especially the Persian and Syrian works, while arabesques and geometric patterns predominate in Egypt. Inscriptions are made almost always to contribute to the decorative effect. The Mesopotamian and Persian schools, though undoubtedly of much earlier origin, gained new life in the twelfth century, when Tatar and Turkish influence gave to artists far greater freedom in the use of the human figure. The school of Damascus was the most famous centre at the time of the Crusades, giving its name to the entire process of damaskeening or inlaying. The Egyptian school, with its centre at Cairo, flourished somewhat later, under the Mameluke rulers of the fourteenth century. The objects made wholly of gold and silver have almost entirely disappeared, but the inventories of the palaces of the rulers of Bagdad and Cairo prove the existence of many thousands of such objects—vases, boxes, mirrors, stands, lamps, trays, coffers, figures of birds and animals, dishes, cups, flagons, bowls. Of these classes many objects still remain in the baser metals, either plain or damaskeened; particularly interesting are the hanging lamps, lanterns, and chandeliers, the stands and tables, mosque doors, perfume burners, ewers, boxes (especially writing boxes), trays, and bowls. It is in the magnificent arms and armor that the metal workers showed the supremest mastery, using all the processes—chiseling, damaskeening, enameling, jewel setting—to produce the masterpieces in the shape of poniards, swords, and yataghans, helmets, breastplates, and lances, stirrups, bits, and the rest of the military equipment and caparison, including, in later times, muskets, pistols, and halberds. In this special field the school of Syria (Damascus) reigned supreme, manufacturing the best pieces for the entire Mohammedan world. The Persian style was more ornate, standing midway between Syrian simplicity and Indian gorgeousness. See INDIAN ART.

Glass. It is in Egypt that stained-glass windows were made, rivaling on a small scale the cathedral windows of the Gothic period. Here, as in every other branch, there is originality of methods. The windows are small, forming usually an oblong of less than 2 by 3 or 4 feet. The frame is of wood, and the process consists of pouring a bed of plaster into this frame, letting it set, and then cutting out the design, leaving only narrow rims or bands of plaster to hold the glass. The design is extremely elaborate, with a central motif, usually of flowers, plants, and trees; the bits of stained glass cut to fit over the openings are laid on and fastened with fresh plaster. The openings are often slanting towards the street and the plaster artistically finished on the outside. The effect on the inside is similar to mosaic. The commonest designs are: pinks and other flowers growing from a vase; cypress with entwined flower stem; scroll of flowers and leaves; kiosk between buds or cypresses; one or two cypresses with flowers. Earlier than these are the more purely geometric designs, as in the tomb of Bibars at Cairo. Of course the plaster is far more fragile than lead as a frame, and the windows easily disintegrate and cannot be made large. Such windows (called kamariyeh) are found not merely in mosques, but in the meshrabiyyeh or latticed projecting windows of private houses. Such windows, of monumental size and importance, adorn the mosques of Solymán, Ahmet I, the Yeni Djami, and others at Constantinople. In harmony and quiet depth of color they equal or surpass their more colossal Gothic counterparts.

A different kind of artistic glass is exemplified in the mosque lamps of enameled and painted glass. It is true that there is a great quantity of exquisite glass, both white and colored, showing in Persia; Syria and Egypt still carried on in the Middle Ages the old Egyptian and Phœnician industry, with exquisite understanding of forms and tones, furnishing models to Venice; but it is in the mosque lamps that the glassworkers certainly enter the domain of fine art. Here the colors are enameled on a gilt ground and the designs are similar to those of metal work, with greater prominence given to inscriptions; cobalt, red, pale green, and white are the principal enamels, and the decoration is in bands with medallions. The most beautiful examples are works of the fourteenth century from the mosques of Cairo. The mellow light shining through the enamels and glass of these suspended lamps was of an exquisite effect.

Illumination of Manuscripts. The aversion to the representation of the human figure hindered the development of the art of illumination—a branch of art not cultivated extensively until the later Middle Ages. It is true that figured compositions were not unknown either to the Egyptian or the Syrian artists, but it was the Persian school, under Tatar and Mongol influences, which first boldly attempted scenes of daily life and of history. There are many manuscripts of the Koran belonging to the other schools, whose first and last pages are a mass of geometric and floral ornament. The finest collection of Egyptian manuscripts, executed mainly for the sultans of the fourteenth and fifteenth centuries, is that of the Cairo Museum rescued from the mosques, such as those of sultans Kalaun, Shaban, and Barkuk. Sometimes the flowers, arabesques, and polygons are in colors on a gold ground, sometimes in gold on a ground of

plain blue or red or of shaded and grouped colors. The finest of these illuminated pages surpass anything done by Christian artists in richness, in exquisite coloring, and in fineness of execution. They are executed not on vellum, but on fine Egyptian cream-colored or reddish paper. The Syrian and Persian schools avoided the geometric ornamentation, and their floral designs were freer and more naturalistic. The Persian fondness for legend and poetry shows itself in the rich illumination of poems and stories which gave occasion for charming genre scenes and vignettes, and the artist's fancy sprinkled animals and birds in riotous confusion on a background of beautiful garden scenes.

It is in these figured illuminations alone that we can study the style of the fresco painters of Mohammedanism, whose works have disappeared. It is plain from native writers that the caliphs of Bagdad, the rulers of Egypt and Spain, at different times lavishly patronized figure painters and that such works were not confined to the Persian school. It is interesting to note the similarity between Persian and Chinese painted design and to make the Mongols the intermediaries between the two schools. The primitive conception of composition and figure and the awkward conventionalities make the Persian school, though successful in coloring, less successful in its sphere than the purely decorative Egyptian. The most famous Persian illuminators belong to the sixteenth century, such as Fabrizio, Jehangir, Bukhari, and Bahzad. The latter's works are masterly in composition and correspond to the Italian Giottesque masters. The last great master was Mari, a Naturalist from India.

Textile Fabrics. The Far East had always been famous for its artistic stuffs, embroideries, tapestries, rugs. It was as successors to the arts of Persia and Babylon that the Mohammedans developed this branch, though Bagdad, Damascus, Cairo, and Cordova all took part and the tribes and villages rivaled with the large cities. Nothing became more characteristic of the East, nothing influenced the West more strongly, through constant importation and the contact of the Crusaders. The haute-lice tapestry, after a method long lost in Europe, was in current use. The same difference finally appeared in the designs here as in other branches: geometrical and set patterns being more common in Egypt; free floral designs being used in Persia. The few known Persian rugs of as early a period as the thirteenth and fourteenth centuries are now valued at many thousand dollars (\$10,000 to \$40,000), and a study of their design shows an almost incalculable variety of native flowers naturalistically reproduced. The Syrian school had much in common with the Byzantine and, as usual, occupied a middle position, with medallions in a stiff floral ground containing heraldic animals or birds. There were in every Mohammedan country royal manufactories whose products were entirely reserved for the court and sovereign; the standards, baldachins, tents, royal robes, hangings, housings, and rugs were all of a magnificence unknown to the ruder West and unsurpassed at any time. The known specimens date no earlier than the eleventh century, and the art decayed before the sixteenth century.

Influence on Europe. Sicily, southern Italy, Venice, and Spain were affected by the Mohammedan arts during the Middle Ages and even as

late as the Renaissance. Hence the use of the pointed and the horseshoe arch in many parts of southern Europe. The cosmopolitan culture of the Norman kings of Sicily had a large Mohammedan element. The palaces of the kings—such as La Kuba, La Ziza, Favara, and Baida—were imitated from those of the Eastern emirs and sultans; San Giovanni degli Eremiti seems an importation from Cairo. Mohammedan artists executed the wonderful stalactite ceiling in carved wood and probably also the geometric mosaics in the Cappella Palatina at Palermo. The famous Ruffolo Palace at Ravello and several cloisters (e.g., at Amalfi) show the spread of Eastern architectural forms in Campania. It is interesting to see how in most cases where there are traces of Byzantine art there are also signs of Mohammedan influence, and vice versa. This is nowhere more evident than in Venice, where both forms of Oriental art were so prominent. Here quite a flourishing school of Mohammedan metal workers was established, existing as late as the sixteenth century, when Mahmud El Kurdi signed some exquisite pieces. The Italian artists who imitated them called themselves workers *all' agemina*, 'in the Persian style,' and even Cellini confesses to have copied Oriental arms. In fact, the Renaissance metal workers of the sixteenth century both in Italy and France owed more than their mediæval predecessors to Oriental design; and there are traces of a like influence in German ironwork and niellos of the sixteenth century, especially that of Nuremberg. Even more widespread and radical was the use and imitation in Europe of Oriental stuffs and fabrics, partly Byzantine, but especially Mohammedan—wonderful not merely for beauty of material, but for the figures and patterns woven or embroidered. The imported tents, baldachins, hangings, carpets, and the like furnished the models for the European ateliers in Sicily, Rome, Venice, Belgium, and France.

Bibliography. G. Le Bon, *La civilisation des Arabes* (Paris, 1883), contains the most suggestive general sketch of the Mohammedan arts, with numerous illustrations; Gayet, in *L'Art arabe* (ib., 1893) and in *L'Art persan* (ib., 1895), describes the various arts in Mohammedan Persia and Egypt in handbook form. A more thorough book of the same type is Stanley Lane-Poole, *The Art of the Saracens in Egypt* (London, 1886). Franz-Pascha, *Die Baukunst des Islam* (Darmstadt, 1896), is a general historical and critical treatise on Mohammedan architecture and decorative details, with description of the different classes of buildings. For the designs and patterns used in decoration, the best textbooks are those of J. Bourgoïn, *Les arts arabes* (Paris, 1868-70) and *Précis de l'art arabe* (ib., 1889). In James Fergusson, *History of Architecture* (new ed., New York, 1907), considerable space, with not very scientific treatment, is given to the Mohammedan styles; see also his *Indian and Eastern Architecture* (London, 1876); M. von Berchem, in his "Notes d'archéologie arabe" (in various years of the *Journal Asiatique*), is laying a good historic basis for an historic treatment and making known new monuments. The most sumptuous illustrative plates are still, for Egypt, in A. C. T. E. Prisse d'Avennes, *L'Art arabe d'après les monuments du Caire* (Paris, 1869-77), and, for Persia, Flandin and Coste, *Monuments modernes de la Perse* (ib., 1867). For Spain the

first serious work was Girault de Prangey, *L'Architecture des Arabes et des Maures en Espagne, en Sicile et en Barbarie* (ib., 1842), which should be supplemented by the Spanish government publication, *Monumentos arquitectónicos de España* (Madrid, 1877 et seq.); also A. F. Calvert, *Moorish Remains in Spain* (2 vols., London, 1905-07). The sumptuous *Jey-pore Portfolio of Architectural Details* edited by S. S. Jacob (7 vols., London, 1890-94) illustrates Moslem decorative art in one province of India. The architecture of Turkey is treated with some fullness in two works: Montani, *Architecture ottomane* (Constantinople, 1873), and Parvillée, *Architecture et décoration turques* (Paris, 1874). By far the best general treatise on Mohammedan art is that of Saladin and Migeon, *Manuel d'art musulman* (2 vols., Paris, 1907). Nothing satisfactory has been published about the monuments of northern Africa, of Syria, or Asia Minor. Aside from the works remaining in situ there are not many collections of the smaller works of Mohammedan art. That of the South Kensington Museum is important, as are those of Cairo, of Constantinople, and of the Musée des Arts Decoratifs in Paris. See cuts in articles ARABESQUE and ARABIAN ART.

MOHAMMEDANISM. The name commonly given in the West to the religion founded by Mohammed. The proper name is Islam (q.v.), suggested by Mohammed himself, which meant 'resignation,' or acceptance of the divine will, and was explained by the prophet to include the performance of five duties (the "five cardinal points of Islam"), viz.: acceptance of the formula, "there is no god but Allah, and Mohammed is his prophet"; prayer; almsgiving; the fast of Ramadan; and the pilgrimage to Mecca.

Doctrine and Practice. Like every organized religion, Islam, as developed by the Mohammedan theologians, presents two sides—the theoretical part, known as *imān* (faith), and the practical part called *dīn* (religion). The doctrine concerning God, His nature and attributes, coincides with the Jewish and Christian in so far as He is by both taught to be the Creator of all things in heaven and earth, who rules and preserves all things, without beginning, omnipotent, omniscient, omnipresent, and full of mercy. But, according to the Mohammedan belief, He has no offspring. Jesus is regarded, like Adam, Abraham, and Moses, as a prophet and apostle, although his birth is said to have been due to a divine intervention; as the Koran superseded the Gospel, so Mohammed superseded Jesus and all preceding prophets. Next to the belief in God that in *angels* forms a prominent dogma, and, like the former, may be traced back directly to Jewish and Christian and in a smaller degree to Persian influences. Created of fire and endowed with a kind of incorporeal body, angels stand between God and man. There are four chief angels: Gabriel, the angel of revelation; Michael, the special protector and guardian of the Jews; Azrael, the angel of death; Israfil (Uriel), whose office it will be to sound the trumpet at the resurrection. Besides angels there are good and evil *genii* (see JINN), of a grosser fabric than the former and subject to death. They have different names and offices (*piris*, fairies; *deves*, giants; *takwīns*, fates; etc.), and are much like the *shedim* in the Talmud and Midrash and the demons of other peoples. The chief of the evil

genii is Iblis (q.v.), once called Azazel, who, refusing to pay homage to Adam, was rejected by God. A third belief is that in certain divinely given *scriptures*, revealed successively to the different *prophets*. Originally there were 104 sacred books, but only four have survived, viz.: the Pentateuch, the Psalms, the Gospel, and the Koran, and the first three are in a mutilated and falsified condition. The number of prophets sent at different times is stated variously at between 200,000 and 300,000. Among them 313 were apostles and six were specially commissioned to proclaim new laws and dispensations, which abrogated the preceding ones. These were Adam, Noah, Abraham, Moses, Jesus, and Mohammed—the last the greatest of them all, and the propagator of the final dispensation. The belief in the *resurrection* and the *final judgment* is an important article of faith, which in the theological writings later than Mohammed is elaborately developed. The condition of the dead in the future world and the punishment of the wicked are pictured with a great multiplicity of details. The dead are received in their graves by an angel announcing the coming of the two examiners, Munkar (unknown) and Nakir (repudiating), who, described as two black angels with blue eyes, put questions to the dead respecting his belief in God and Mohammed and, in accordance with the answers, either torture or comfort him. The soul, awaiting a general resurrection, is treated according to its rank; prophets enter immediately into Paradise; martyrs, in the shape of a green bird, partake of the delights of the abode of bliss; common believers either stay near the grave, or are with Adam in the lowest heaven, or remain in the well Zemzem or in the trumpet of the resurrection, or rest in the shape of a white bird under the throne of God. The souls of infidels dwell in a certain well in the province of Hadramaut (interpreted as chamber of death), or, being first offered to heaven, then to earth, and rejected by both, are subject to unspeakable tortures until the day of resurrection. Concerning the latter considerable discrepancy reigns among the Mohammedan theologians. Mohammed himself seems to have held that both soul and body will be raised, and it is said that the rump bone will remain uncorrupted till the last day, and from it the whole body will spring anew after a forty days' rain. Among the signs by which the approach of the last day may be known are the decay of faith among men, the advancing of the meanest persons to the highest dignities, wars, seditions, and tumults, and consequent dire distress. Certain provinces shall revolt, and the buildings of Medina shall reach to Mecca. These are the eight "lesser" signs; of "greater" signs there are no less than 17; the sun will rise in the west, the Beast will appear, Constantinople will be taken by the descendants of Isaac, the Antichrist will come and be killed by Jesus at Lud (Lydda). Further, there will come a war with the Jews, Gog and Magog's (*Yājūj* and *Mājūj*) eruption, a great smoke, an eclipse, the Mohammedans will return to idolatry, a great treasure will be found in the Euphrates, the Kaaba will be destroyed by the Ethiopians, beasts and inanimate things will speak, and finally, a wind will sweep away the souls of those who have faith, even if equal only to a grain of mustard seed, so that the world shall be left in ignorance. The time of the resurrection even Mohammed could not learn

from Gabriel; it is a mystery. Three blasts will announce it—that of consternation, of such terrible power that mothers will neglect the babes on their breasts and heaven and earth will melt; that of examination, which will annihilate all things and beings, even the angel of death, save Paradise and hell and their inhabitants; and, 40 years later, that of resurrection, when all men, Mohammed first, will have their souls breathed into their restored bodies and will sleep in their sepulchres until the final doom has been passed upon them. The day of judgment, lasting from 1000 to 50,000 years, will call up angels, genii, men, and animals. The trial over, the righteous will enter Paradise, to the right hand, and the wicked will pass to the left, into hell; both, however, have first to go over the bridge *Al Sirāt*, laid over the midst of hell, finer than a hair, sharper than the edge of a sword, and beset with thorns on either side. The righteous will proceed on their path with ease and swiftness, but the wicked will fall headlong. *Hell* is divided into seven stories or apartments, respectively assigned to Mohammedans, Jews, Christians, Sabians, Magians, idolaters, and—the lowest of all—to the hypocrites, who, outwardly professing a religion, in reality had none. The degrees of pain—chiefly consisting in intense heat and cold—vary; but the Mohammedans and all those who professed the unity of God will finally be released, while unbelievers and idolaters will be condemned to eternal punishment. *Paradise* is divided from hell by a partition (*‘urf*) in which a certain number of half saints will find place. The blessed, destined for the abode of eternal delight (*Al Jannah*, Heb. *Gan-Eden*), will first drink of the pond of the Prophet, which is supplied from the rivers of Paradise, whiter than milk and more odoriferous than musk. Arrived at one of the eight gates, they will be met by beautiful youths and angels; and their degree of righteousness (prophets, religious teachers, martyrs, believers) will procure for them the corresponding degree of happiness. Mankind on the last day will be assembled in three classes: (1) those who go on foot, believers whose good works have been few; (2) those who ride, believers acceptable in the eyes of God; and (3) those who creep, the unbelievers. The various felicities which await the pious represent a conglomeration of Jewish, Christian, Zoroastrian, and other fancies to which the Prophet's own sensual imagination has added very considerably. Feasting in the most gorgeous and delicious variety, the most costly and brilliant garments, odors, and music of the most ravishing nature, and, above all, the enjoyment of the *Hur al ‘uyūn*, the black-eyed daughters of Paradise (see *HOURI*), created of pure musk, are held out as a reward to the commonest inhabitant of Paradise, who will always remain in the full vigor of youth and manhood. For those deserving a higher degree of recompense rewards will be prepared of a purely spiritual kind—i.e., the “beholding of God's face” (*Shekinah*) by night and by day. The last of the precepts of pure faith taught by Mohammedanism is the full and unconditional submission to God's decree, and the *predestination* of good and evil, which is found from the beginning inscribed on a “preserved table.” Not only a man's fortunes, but his deeds, and consequently his future reward or punishment, are irrevocably, and thus unavoidably, preordained—a

doctrine which is not, however, taken literally by all Moslems.

The first of the four chief duties of *dīn*, or the practical part of Islam, is *prayer*, “the Key of Paradise.” Certain religious purifications are included as necessary preparations. They are of two kinds: the *ghusl*, or total immersion of the body, required on certain special occasions, and the *wudū’*, a partial ablution, to be performed immediately before the prayer. This is of primary importance, and consists in washing the hands, face, ears, and feet up to the ankles—a proceeding generally accompanied at each stage by corresponding pious sentences, and concluded by the recital of the ninety-seventh sura of the Koran. If water is not to be had, sand may supply its place. Even the ground or the carpet upon which one prays must be as clean as possible, and the use of a special prayer carpet (*sajjādah*) is therefore recommended. Every Mohammedan is required to pray five times in the space of 24 hours. The prayer (*salāt*) itself consists partly of extracts from the Koran (*fard*), partly of sentences ordained upon the precept or practice of the Prophet (*sunna*). The times of prayer are: daybreak (*fajr*); noon (*zuhr*); afternoon, midway between the second and fourth (*‘asr*); evening (*maghrib*); after night has closed in (*‘ishā*). These several times of prayer are announced by the muezzins (q.v.) from the minarets of the mosques. The believer passes through a series of 13 postures during his prayers; and a certain number of such inclinations of head and knees, prostrations, etc., is called *rak‘ah*. It is necessary that the face of the worshiper should be turned towards the kiblah, i.e., in the direction of Mecca (see *KIBLAH*). Women, although not forbidden to enter the mosque, yet are not supposed to pray there, lest their presence should be hurtful to true devotion. Besides these prayers there are others ordained for special occasions, as on a pilgrimage, before a battle, at funerals, during an eclipse, etc. The Moslems do not pray to Mohammed, but simply implore his intercession, as they do that of the numerous saints, the relatives of the Prophet, and the first propagators of Islam. Petitions, moreover, play a subsidiary part in the prayers, which are chiefly made up of thanksgivings and praise formulas. Mohammedanism has no clergy in the Western sense of the word, but there is always a leader (*‘imām*), who takes his stand at the head of the congregation and “leads” the latter in prayer. (See *IMAM*; *MOLLAH*; *MUFTI*.) Next to prayer stands the duty of giving *alms*. These are twofold, legal (*zakāt*) and voluntary (*sadaqah*), but the former, originally collected by the sovereign and applied to pious uses, has now been practically abrogated. The *sadaqah*, according to the law, is to be given once every year, of cattle, money, corn, fruits, and wares sold, at about the rate of from 2½ up to 20 per cent. Besides these, it is usual to bestow a measure of provisions upon the poor at the end of the sacred month of Ramadan. The duty of *fasting* follows. During the whole month of Ramadan the Moslem is commanded to refrain from eating, drinking, and every indulgence in worldly pleasure, from daybreak until sunset. During the night he is allowed to eat, drink, and enjoy himself. Certain classes are exempt, as it was Mohammed's special and express desire that no one should fast who is not equal to it, lest he injure his health and disqualify himself

for necessary labor. Of other commendable fast days, the most important is the *'Ashūrā*, on the tenth of Muharram, corresponding in a measure to the Jewish Day of Atonement. The fast of Ramadan is universally kept, in letter if not in spirit, fasting being considered "one-fourth part of the faith." (See FAST; RAMADAN.) The last duty is the *pilgrimage* to Mecca, which every Moslem must make once in his life, if he be free, sound in body, and able to meet the expense. Women also perform the pilgrimage. To pay the way of one who cannot himself afford it is considered a pious act, and the Shiites allow the pilgrimage to be made by proxy. See HAJJ; HAJJI.

To the "positive" ordinances of Islam may be added the *saghir* or *lesser* and *kabir* or *greater* festivals. The first (*al fitr*, or breaking the fast) follows immediately upon Ramadan, beginning on the first day of the month of Shawwal, and lasts three days. The second (*'id al kurbān*, or sacrifice festival, also called *'id al duha* in India, *'id al Bairam* in Turkey and Egypt) begins on the tenth of Dhul hijjah. The latter was intended to be the more important of the two, but the people have in most places changed the order, and make the lesser festival, which follows Ramadan, the more joyful and the longer. The day set aside for the weekly assembly is Friday, which, however, is not a day of rest.

Islam also enjoins a number of *prohibitory laws* based upon utterances of the Prophet. The drinking of *wine*, which includes all strong and inebriating liquors, is, rigorously forbidden. Chiefly through European influence some Moslems have lost their scruples on this score, but the great majority of the faithful refuse even to make use of the proceeds of the sale of wine or grapes. Some scrupulous believers even include opium, coffee, and tobacco in the prohibition; but general practice has decided differently. The prohibitory laws respecting *food* resemble closely those of Rabbinical Judaism; blood, the flesh of swine, animals which have died from disease or age, or on which the name of some idol has been invoked, or which have been sacrificed unto an idol, or which have been strangled, or killed by a blow, a fall or by some other beast, are strictly forbidden. "Pure" animals must be slaughtered according to certain fixed rules, and fish, bird, game, are generally allowed for food. All *games* subject to chance—such as dice, cards, tables, bets, etc.—are considered so wicked that a gambler's testimony is invalid in a court of law. Chess and other games depending on skill—provided they do not interfere with the regular performance of religious duties, and that they are played without any stakes—are allowed by the majority of Moslem theologians. *Usury* is strictly prohibited. Taking interest upon any loans, however large or small, or profiting in trade through questionable means, save by buying and selling, is severely condemned. To prevent the faithful from ever falling back into idolatry, the laws relating to *images* and *pictures* have been made very stringent. Whosoever makes an imitation of any living being in stone, wood, or any other material, shall, on the day of judgment, be asked to endow his creation with life and soul, and, on his protesting his inability to do so, shall undergo the punishment of hell for a certain period.

The *civil* and *criminal laws* of Mohammedan-

ism, founded on both the Koran and the Traditions (*Sunna*, q.v.), in instances where the letter of the written or oral precept allows of various explanations, or where the case in question is unprecedented, are interpreted according to the opinion of one of the four great masters of Islam: Abu Hanifah (born 702), Malik ibn Anas (born 714), Mohammed al Shafi (born 767), and Ahmad ibn Hanbal (born 780), within the pale of their respective sects. (See MOHAMMEDAN SECTS.) Upon the principal points all Mohammedans agree. In regard to *marriage*, polygamy is allowed, but not without restriction. Four wives, though he may cohabit with any number of concubine slaves, is the legal limit for a Moslem. The Prophet's example proves nothing to the contrary, since he was endowed with special privileges and was not in all respects subject to the common law. It is, moreover, added as advice that to marry one or two is quite sufficient for a man. As a matter of fact, the rule among Mohammedans of the present day is to have but one wife. A Moslem may marry a Christian woman or a Jewess, but a Mohammedan woman is not, under any circumstances, to marry an unbeliever. In all cases, however, the child born of a Moslem, whatever the mother's faith, is a Moslem; nor does the wife who is an unbeliever inherit at her husband's death. Forbidden degrees are: the mother, daughter, sister, half sister, aunt, niece, foster mother, or a woman related to the faithful "by milk in any of the degrees which would preclude his marriage with her if she were similarly related to him by consanguinity"; the mother of his wife, even if he be not yet actually married to the latter; the daughter of his wife, if the latter still be his legal wife; his father's wife and his son's wife; two sisters at the same time; wives who stand to each other in the relation of aunt and niece; or the unemancipated slave, or another man's slave, if he have already a free wife. A simple declaration of a man and woman at the age of puberty, before two witnesses, of their intention to marry each other, and the payment of part of the dowry (which is indispensable, and must amount to at least 10 dirhems, or about \$1) is sufficient for a legal marriage. A girl under age is given away by her natural or appointed guardian, with or without her consent. To see the face of any woman who is neither his wife nor his concubine, nor belongs to any of the forbidden degrees, is strictly forbidden to the believer. *Divorce* is a comparatively light matter with the Mohammedans. Twice a man may send away his wife and take her back again without any ceremony; the third time, however, he may not receive her again in wedlock unless she have been married properly to another man in the meantime. Mere dislike is sufficient reason for a man to dissolve the conjugal ties, and his saying "Thou art divorced," or "I divorce thee," together with the repayment of the dowry, is all that is required from him by the law. A wife, on the other hand, is bound to her husband forever, unless she can prove some flagrant ill usage or neglect of conjugal duty on his part; and even then she forfeits part, or the whole, of her dowry. A divorced woman is obliged to wait, like the widow, for a certain period before marrying again. If she have a young child, she is to suckle it until it be two years old, and the father is to bear all the expenses of the maintenance of mother and child. If a

slave becomes a mother by her master, and he acknowledges the child to be his own, the latter is free, the mother becomes the wife of her master, and may not be given away or otherwise disposed of by him during his lifetime. A free person, wishing to marry his or her slave, must first emancipate this slave; and if the slave of another person has been married by a free man or woman, and afterward becomes the latter's property, the marriage becomes illegal, and can only be renewed by a legal contract and emancipation. As regards *inheritance*, males generally receive a double share. A person may not bequeath more than one-third of his property, unless there be no legal heirs. Children, whether begotten with the legal wife, or slave, or concubine, or only adopted, and their descendants, are the first heirs; next come the claims of wives, parents, brothers, sisters, in their order. Where there is no legal heir the property falls to the state. The law is very lenient towards *debtors*. Insolvency and inability to work for the discharge of the claim absolve from all further obligations. The most conscientious performance of all private contracts is constantly recommended in the Koran. *Murder* is either punished with death or by the payment of a fine to the family of the deceased, according to their own pleasure. There must, however, be palliating circumstances in the latter case. The Bedouins still maintain the primitive Semitic law of blood revenge, and up to this day the "vendetta" often rages not only between family and family, but between whole tribes, villages, and provinces. Unintentional homicide is expiated by freeing a believer from slavery and paying to the family a certain sum in proportion to the rank and sex of the deceased. He who has not the means of freeing a believer is to fast for two months by way of penance. According to the strict letter of the law a man is not liable to capital punishment for killing his own child or an infidel; but practically no difference is made by the Mohammedan governments (chiefly the Turkish) at the present time. Murder is punished with death and no fine frees the culprit. *Injuries to the person* are punished according to the primitive law of retaliation; i.e., a certain proportionate fine in money is to be paid to the injured. The payment for any of the single limbs of the human body (e.g., the nose) is the full price of blood, as for a homicide; for a limb which is found twice, like hand or foot, half; for a finger or a toe, the tenth part; etc. Women and slaves have smaller claims. Injuries of a dangerous or otherwise grievous nature pay the full price; those of an inferior kind, however, bring the perpetrator within the province of the lash or cudgel. The Koran orders small *theft* to be punished by cutting off the chief offending limb, the right hand; the second theft is punishable by the loss of the left foot; the third, of the left hand; the fourth, of the right foot, etc.; but the ordinary punishments of imprisonment, hard labor, and the bastinado have been substituted in later times. The property stolen must not, however, have been of easy access to the thief, nor must it have consisted of food, since he may have taken this to satisfy the craving of his hunger. *Unchastity* on the part of a woman was in the commencement of Islam punished by imprisonment for life, for which afterward, however, stoning was substituted in the case of a married woman and a hundred stripes

and a year's exile in the case of an unmarried free woman, a slave to undergo only half of that punishment. He who accuses a "woman of reputation" of adultery or fornication must produce four (male) witnesses, and if he be not able to do so he is to receive fourscore stripes, nor is his testimony ever after to be received unless he swear four times that he speaks the truth and the fifth time imprecate God's vengeance if he speak false. Even this testimony may be overthrown by the wife's swearing four times that her accuser is a liar, and imprecating the fifth time the wrath of God upon herself if he speak the truth. In the latter case she is free from punishment; the marriage, however, is to be dissolved. Fornication in either sex is, by the law of the Koran, to be visited with a hundred stripes. *Infidelity*, or *apostasy* from Islam, is a crime to be visited by the death of the offender, if he have been warned thrice without recanting. Severer still, i.e., not to be averted by repentance or revocation of any kind, is the punishment inflicted for blasphemy—against God, Mohammed, Jesus, Moses, or any other prophet. Immediate death is the doom of the offender.

A further injunction of the Koran is that of making war against the infidels (*jihād*). He who is slain while fighting in defense of Islam or for its propagation is reckoned a martyr; while a deserter from the holy war is held up as an object of execration and has forfeited his life in this world as well as in the world to come. At first all the enemies taken in battle were ruthlessly slain; later, however, it became the law to give the people of a different faith against whom war was declared the choice of three things—either to embrace Islam, in which case they become Moslems at once, free in their persons and fortunes, and entitled to all the privileges of Moslems; or to submit to pay tribute, in which case they were allowed to continue in their religion if it did not imply gross idolatry or otherwise offend against the moral law; or to decide the quarrel by the fortune of war, in which case the captive women and children were made slaves and the men either slain if they did not become converts at the last moment or otherwise disposed of by the prince. The fifth part of the spoil belongs "to God," i.e., must be devoted to a sanctuary, to the Prophet and his kindred, to the orphans, the poor, and the traveler.

It must not be overlooked that the Islam of history and of the present time is not the pure and unmodified teaching of its founder. The Koran was not intended to be a systematically arranged code of laws. Such laws and regulations as it contains were called forth by some occurrence during the Prophet's life, and were, properly, supplementary to existing laws and customs, which they abrogated, confirmed, or modified according to the occasion. In course of time cases arose for which no written rules could be found laid down by Mohammed. Recourse was then had to traditional oral dicta or to the Sunna (q.v.); in time precedents were established and laws came into force by the concurrence of the learned (*ijmā'*), or by a process of reasoning (*kiyās*). In this way the "peculiar" system which is called Mohammedan jurisprudence came into being, theoretically founded on the Koran, but often strangely at variance with the principles and spirit of its author. In like manner the reprehensible features of the doctrine and daily life of Islam

must not be charged indiscriminately against Mohammed. That part of the system which most distinctly reveals the mind of its founder, and which also has undergone least change in the course of time and constitutes its most complete and brightest part, is its ethics. Injustice, falsehood, pride, vindictiveness, calumny, mockery, avarice, prodigality, debauchery, mistrust, and suspicion are inveighed against as ungodly and wicked; while benevolence, liberality, modesty, forbearance, patience and endurance, frugality, sincerity, straightforwardness, decency, love of peace and truth, and above all trust in God and submission to His will, are considered as the pillars of true piety and the principal signs of a true believer. Mohammed never expressly laid down that doctrine of absolute predestination and "fatality" which destroys all human will and freedom, and which by the influence of Mohammedan theologians became a fixed element in the orthodox creed. A glance at his system of faith (so far as he had a system), built on hope and fear, rewards and punishments, Paradise and hell, both to be man's portion according to his acts in this life, and the incessant exhortations to virtue and denunciations of vice, are sufficient to prove that aboriginal predestination is not in the Koran, where only submission to Allah's will, hope during misfortune, modesty in prosperity, and entire confidence in the divine plans are supported by the argument that everything is in the hands of the highest Being and that there is no appeal against His absolute decrees. This is but one instance of the way in which Mohammed's dicta have been developed and explained—in such a manner that he has often been made to teach doctrines which he really did not teach; and thus many elements now found in the Moslem creed, if carefully traced back to their original source, will be seen to be the growth of later generations.

In a general estimate of Mohammedanism it should not be forgotten what Islam has done for the cause of humanity and more particularly the share it had in the development of science and art in Europe. Broadly speaking, the Mohammedans may be said to have been the teachers of barbarous Europe from the ninth to the thirteenth century. It is from the days of the Abbasid rulers that the real renaissance of the Greek spirit and Greek culture is to be dated. Classical literature would have been irredeemably lost had it not been for the home it found in the schools of the "unbelievers" of the "dark ages." Arabic philosophy, medicine, natural history, geography, history, grammar, rhetoric, schooled by the old Hellenic masters, and the "golden art of poetry," brought forth an abundant harvest of works, many of which will live and teach as long as there will be generations to be taught. See ARABIC LANGUAGE AND LITERATURE.

History. In the first three years of his mission Mohammed won 40 converts, including his wife, Khadija, Abu Bekr, and Othman. Then followed Ali, Omar ibn Khattab, and Hamza. In 615 the persecutions of the Koreish drove 15 of the converts into Abyssinia, and they were later joined by 100 more. After Mohammed's return from Taif to Mecca he won over some of the Bani Khazraj of Yathrib (Medina), who then made converts among the Bani Aus, formerly their enemies. The new faith spread rapidly from tribe to tribe, the Bani

Abd al Ashhal going over in a body. In 622 the number of Mohammedan pilgrims from Yathrib is said to have been 73. After the departure from Mecca Mohammed became the arbiter between the Aus and the Khazraj in Yathrib, and the civil head of the commonwealth. Thus Islam became a political as well as a religious movement.

Mohammed's plans included now nothing less than the conversion of the world to Islam. If he had at first hoped to accomplish this by peaceful measures alone, the aggressiveness of his enemies in advancing against Medina soon forced the preacher to become warrior also, and military success won more and more converts. In 628 Mohammed sent letters to the Byzantine Emperor, Heraclius, to the King of Persia, to the Governor of Yemen, to the Governor of Egypt, and to the King of Abyssinia, inviting them to join the new religion. In the same year he converted part of the Bani Daus of Yemen, and two years later the rest of the tribe followed; in the meanwhile 15 other tribes responded. With the fall of Mecca in 630 A.D., the triumph of Islam in Arabia was assured. Some of the Prophet's bitterest enemies became his most ardent followers; and the next year saw so many embassies suing for alliance that it became known as the "year of the deputations."

After Abu Bekr had brought about the re-subjugation of the northern tribes, who had revolted on Mohammed's death, an army was sent into Syria, as the Prophet himself had planned. A second army was sent into Irak. The latter came into contact with the Persian forces, and in Omar's caliphate, by the victory at Kadisiyah, Chaldaea and Mesopotamia were assured to the Arabs. Christian Bedouins of both sides of the Euphrates became converted at this time, even though tolerance was extended to those who kept their own faith. In Syria almost the only opposition came from Heraclius' armies. The great mass of the people, oppressed by the Byzantines, welcomed the Arabs. By 639 the Greeks had been driven out of the province, most of the large towns having made treaties which guaranteed them toleration of religious belief and protection of life and property on the mere payment of the *jizyah* (poll tax) and *kharaj* (land tax). Friendly relations being thus established, in the following years there was a gradual assimilation of Arabic manners and customs throughout Syria, which made the conversion of the natives easy. Many Christians were converted in the 50 years between Omar and Abd al Malik in Irak, Khorasan, etc. Omar II (717-720) was particularly successful by lightening the burdens of Mohammedan landowners. In addition, the children of women captives were brought up as Moslems; and slaves were allowed to purchase their freedom at the price of conversion. In the tenth century the Nestorian Bishop of Bet Garmal was a noted convert; in 1016 Ignatius, the Jacobite Metropolitan of Takrit (at Bagdad), became Abu Muslim. Converts were won in the following centuries, even from among the Crusaders. Binaud and his followers embraced Mohammedanism in a body; 3000 Crusaders accepted Islam in Phrygia in 1148 as a result of Mohammedan kindness contrasted with ill treatment on the part of Greek Christians. To-day over 50 per cent of the population of Syria and Palestine is Moslem.

The rapidity with which Mohammedanism spread in Syria and Mesopotamia was not duplicated in the country to the north. In Armenia, even after the Christian power had been overthrown by the Seljuks of the eleventh century, the mass of the population continued Christian. Georgia resisted until the invasion of the Mongols. After the fall of Constantinople (1453) the western and central portions of the country became converted, and after the ruling dynasty of Samtskhé in 1625 had become Mohammedan, progress was rapid among the aristocracy. The eastern portion of the country had submitted to Persia, and hence was naturally subject to Mohammedan influence. In the seventeenth century there were two petty kingdoms in the East the rulers of which, though native princes, were Moslems. Since the beginning of the nineteenth century Georgia has belonged to Russia, but certain parts are still Mohammedan.

After the Mohammedans had succeeded in subduing Syria they turned their attention to Egypt. Amr ibn al Asi drove the Byzantines out between 639 and 641 A.D., and the whole of the country as far south as Abyssinia and as far west as Libya came under Moslem influence. The conquerors, who treated the natives, and especially the Copts, with great favor, were welcomed by them. Many Copts accepted Islam even before the fall of Alexandria; while the number of converts, partly forced, partly willing, up to the caliphate of Omar II (717-720) was large. In the twelfth century Islam was carried, principally by Moslem merchants, into Lower Egypt, and in the fourteenth century into Nubia, the King of Dongola becoming a Moslem in 1340. In Abyssinia conversions were first made in the coast towns in the tenth century, and towards the end of the twelfth a Mohammedan dynasty was founded. In the sixteenth century the Mohammedan Kingdom of Adal, between Abyssinia and the southern end of the Red Sea, came into existence; in the seventeenth one-third of its entire population was Moslem, while in the middle of the nineteenth one-half of the central province of Abyssinia had likewise been converted.

Amr ibn al Asi conquered northern Africa as far as Barca (Cyrenaica). Before the end of the century rapid progress had been made among the Berbers, who made their last resistance at the Spring of Kahina in 703. Musa ibn Nusair and Omar II, the Conqueror, made innumerable converts. In 789 western Africa (Mauretania) became separated from Egypt as a kingdom under Idris, founder of the Idrisite dynasty; in addition to converting many Berbers, he is said to have forced Christians and Jews to apostatize. The Berbers, however, under the Idrisites as under the Aghlabites (a dynasty founded in 800 by Ibrahim ibn Aghlab, hereditary Governor of Ifrikiyyah) were in constant revolt. In the beginning of the tenth century Abu Abd Allah appeared among them as the apostle of the Ismailian sect and succeeded in winning over the whole of the powerful Kitamah tribe to the support of the imamate of Ubaid Allah; and the dynasty of the Fatimites was thus successfully established in Kairawan. Early in the eleventh century the faith spread rapidly among the Berbers of the Sahara also, among whom it had been introduced in the ninth century. The revival was due principally to a chieftain of the Lamtuna

tribe, Abd Allah ibn Yasin, who founded a monastery, *ribat*, and won many disciples from various tribes, to which he sent them back as missionaries. In 1042 he led his followers, known as the *Murabituna* (Almoravides), against the neighboring tribes, and by force and persuasion succeeded in establishing a vast empire. Before the end of the century it extended from Senegambia to Algiers; Mohammedan Spain was brought under the sway of the Almoravides. In the beginning of the twelfth century another dynasty was founded among the Berbers, when Abu Abd Allah Muhammad ibn Tumart appeared in the Mauretanian mountains and preached especially against the laxity of morals and the excessive veneration paid to saints. His followers became known as the *Muwahhiduna* (Almohades, or Unitarians). The conquests and conversions of the Almohades were likewise enormous; by 1160 they had an empire extending from Barca to the Atlantic, and embracing Mohammedan Spain. After these events but few of the Berbers remained heathen.

From northern Africa Islam soon penetrated into the interior of the continent. The Almoravides made many converts in the eleventh century among the negroes of the Sudan, who had already become familiar with the new faith through the visits of merchants and missionaries. The negro tribes of the west were first won over; as early as 1010 the King of Surhay (southeast of Timbuktu) became a Moslem; the states on the upper Niger, Timbuktu (founded in 1077) and Melle (west Sudan, founded by the Mandingos), followed and furnished active missionaries as well. The kingdoms of Bornu and Kanem, along Lake Chad, became converted in the eleventh century, the latter kingdom extending as far as Egypt and Nubia. In Darfur a Moslem dynasty was founded in the fourteenth century; at the end of the sixteenth century Wadai and Bagirmi, and in the seventeenth portions of the Hausa country, became Moslem. In the nineteenth century there was a remarkable revival of Mohammedanism due to the influence of the Wababis. The Fulahs were united into one political organization by Sheik Othman Danfodio, and compelled all the remaining tribes to accept Islam. In French West Africa and French Equatorial Africa Mohammedanism has spread far and wide; and active missionary work has been carried on in Kamerun. The nineteenth-century movement was aided by such religious orders as the Amirghaniyyah, the Tijaniyyah, the Kadriyyah, and the Sanusiyyah. The vast theocracy of the Sanusiyyah has settlements and schools extending from Egypt to Morocco, in the Sudan, Senegambia, Somaliland, the Sahara, and the Galla country; they have gained many converts by education and the purchase of slaves.

Along the west coast of Africa Islam has made steady progress; e.g., on the Guinea coast, in Sierra Leone, in the Ashanti country, Dahomey, the Gold Coast, Lagos (where there are 10,000 Moslems), and Liberia (where there are more Moslems than heathen). Often the common people are converts where the chieftains are not. There is hardly a town along the coast for 2000 miles from the Senegal which has not a mosque.

On the east coast the Emozaydij made settlements before the tenth century; they were Shiites, and were followed by Sunnis, who

founded the town of Magadoxo, and other towns on the coast from Aden to the tropic of Capricorn. Arab traders made Zanzibar Mohammedan. Inland, however, only the Galla and Somali tribes are even partly Moslem. In Cape of Good Hope there have been Moslems since the seventeenth and eighteenth centuries, Islam having been carried there by the Malays. Even among the Hottentots there are converts who make the pilgrimage to Mecca, while in the diamond fields the coolies are said to be missionaries.

Islam was introduced into Spain in 711 by Tarik with 12,000 Berbers. The first converts were from among the ill-treated slaves. The remnant of the heathen population followed, then the nobles and the middle and lower classes of the Christians, so that the majority of the population soon consisted of Mohammedans of non-Arab blood. In 1311 there were 200,000 Mohammedans in Granada alone, only 500 of them being of Arab descent. On the whole, conversion was carried on peacefully except when the Almoravides at the close of the eleventh century came to Spain. The Moslem power began to decline as early as the eleventh century. After the fall of the Almohades, in 1257, it continued chiefly in Granada; the last Moriscos were driven out in 1609.

The Aghlabites made themselves masters of Sicily in 827-878, and under this dynasty and their successors, the Fatimites, a flourishing Moslem civilization existed in the island, the effects of which were still felt after the Norman Conquest (1061-1090) and under the Hohenstaufens (1194-1266).

The Turkish Empire made its first conquests in Europe, at the time of the decline of Islam in Spain. The inception of the Ottoman Empire dates from the beginning of the thirteenth century, when 50,000 Turks settled in the north-west of Asia Minor. In 1353 they entered Europe for the first time and in 1361 made Adrianople their capital. Before the end of the century Bulgaria, Macedonia, Thessaly, and most of Thrace had been subdued by Bajazet; Amurath II (1421-51) added to this territory, and Mohammed II (1451-81), after taking Constantinople in 1453, extended his rule over Greece, Serbia, Bosnia, and Albania. A large part of Hungary was added by Suleiman II (1520-66); in the seventeenth century Crete was taken, and Podolia was ceded by the Poles. The most noted example of forced conversion was the enrollment of Christian children in the ranks of the Janizaries (q.v.). Large numbers were converted peaceably from all ranks; in the fifteenth century Adrianople was the home of countless renegades; in the seventeenth converts were made even among the Christian clergy. Progress was very rapid at this time. The power of Serbia was broken by the Turks in 1389, but the country was not reduced to the position of a Turkish province until 1459, when the inhabitants chose Mohammedan rule in preference to the Roman Catholicism of Hungary. However, though the nobles became Moslems, only in Old Serbia (northeast of Albania) since the seventeenth century has the spread of Islam been rapid. The same period was the date of the rapid conversion of Montenegro; in Bosnia the Bogomiles joined Islam in large numbers after Mohammed II had released over 70 cities from Catholic persecution. The other inhabitants followed gradually, and the Chris-

tians left the way clear by emigrating into the neighboring countries. The conversion of the inhabitants of Crete first took place in the ninth and tenth centuries, when the whole population joined Islam; at the beginning of the thirteenth century the Venetians acquired the island, and in 1669, when it was taken from Venice by the Turks, the inhabitants had to be reconverted; within 50 years half of them were again Moslem.

In Persia Islam made progress very early, for under Zoroastrianism the people were oppressed by priest and ruler alike. After the fall of the Sassanid dynasty in the middle of the seventh century converts were easily made, at first mainly from among the despised industrial classes and artisans. Later the Shiites met with great success, for Husain, son of Ali, had married Shahban, daughter of Yezdegerd, the last Sassanid; and in the middle of the eighth century the Ismailians showed a wonderful power of adapting themselves and their teachings to all classes and creeds. At the close of the ninth century Saman, a noble of Balkh, became a Moslem and founded the dynasty of the Samanids (874-999). Conversions were made in the ninth century by Karim ibn Shahriyar, the converted King of the Kabusiyyah dynasty, and by Nasir al Hakk of Dailam; in 912 Hasan ibn Ali, of an Abd dynasty on the Caspian, made many converts in Dailam and Tabaristan.

North of Persia there had been much opposition to Islam, and allegiance to the Caliph was often renounced as soon as the armies were withdrawn. In Samarkand, however, conversions were brought about by Ibn Kutaibah, who burned the heathens' idols. Among the Afghans the King of Kabul was converted about 800; in Transoxiana many converts were made in the eighth century, and by the middle of the ninth Mohammedanism was general. The greatest impetus to the spread of the new faith came about the middle of the tenth century, when some of the Turkish chieftains were converted; in Turkestan the founder of the Ilak Khans converted 2000 families of his tribe, who became known as Turcomans. In 956 the Seljuk Turks had their origin, when Seljuk migrated with his clan to Bokhara from the Kirghiz steppes.

Much of the progress which Islam had made was lost by the Mongol invasion. Bokhara, Samarkand, Balkh, and Bagdad were left in ruins, and almost without inhabitants. Many Mongol rulers, such as Kublai Khan, were energetic in their opposition to Islam. But in the time of Ogdai Khan (1229-41) certain Buddhists were converted; Yisun Timur Khan (1323-28) was an earnest Moslem and made converts of his troops; Baraka Khan (1256-65) turned Moslem with his subjects—the first ruling Mongol prince to take this step in the eastern portion of the Mongol territory. But it was not till 1295 that Islam became the ruling religion of Persia; at that date Ghazan, seventh of the Ilak khans, joined the new faith. In the Middle Kingdom, in the reigns of Tirneashirin Khan (1322-30) and Tughlak Timur Khan (1347-63), Islam became generally adopted, though Burak Khan (1266-70) had also been a Moslem. In the Golden Horde the leaders and aristocracy followed Baraka Khan when he became converted; Uzbek Khan (1313-40) placed Islam on a solid basis. The Mongols were likewise successful, to some extent, in introducing Mohammedanism into Russia;

e.g., in the Crimea and among the Finns, the Tcheremisses, the Tchuvashes (whole villages of which are Moslem), and the northeast Russian tribes, among whom there are many Mohammedans. In Siberia the first conversions were made in the latter half of the sixteenth century. Since 1745 the Baraba Tatars, between the Irtysh and Ob, have been converted. After the proclamation in 1905 of an edict granting religious liberty large numbers of nominal Christians in Asiatic Russia have openly embraced Islam.

In India the first great Mohammedan conqueror was Mohammed Kasim (711), who took Darbul (capital of Sind), Multan, and other cities early in the eighth century. Under Omar II the native princes were called upon to become Mohammedans, and received Arabic names; but many of them later became heathens again. In 1019 Hardat and 10,000 men accepted Islam; but it was some time before the new religion gained a firm footing in India. Down to near the close of the twelfth century Mohammedan India was only a province of Ghazni; at that time Mohammed Ghuri conquered the northern part to the mouth of the Ganges, and his slave Kutb al Din was made Viceroy of Delhi. The latter then proclaimed himself sovereign of Hindustan and founded the dynasty of the "Slave Kings," the first Mohammedan dynasty in India. Mohammed Ghuri likewise converted the Ghakkars, in the mountains north of Punjab. Under the succeeding dynasty, the Khiljis (1295-1320), Mohammedan rule was extended to the Deccan. The Tughlak dynasty which followed was troubled by revolt and desertion, and its power was much reduced; the Sayyids, as well as the Lodis (1451-1526), were rulers over but one province, Bengal, Jaunpur, Malwa, and Gujarat having independent Moslem dynasties. The Mogul Empire was established in 1526 by Baber, and then Islamic influences were more successful. Many rajputs were converted when idolatry was made a bar to advancement at court. In the eastern districts of the Punjab and in Cawnpore many converts were made in the reign of Aurungzebe.

In southern India and in Bengal the spread of Islam was more rapid. The southern coast was subject to the Mohammedan influences of traders; even in the eighth century refugees had come there from Irak, and missionaries in the eleventh. In Malabar the Mappilas, descendants of the early refugees, are estimated at one-fifth of the population. The Laccadive and Maldive islands, as well as Malabar, have an almost exclusively Moslem population. In the Deccan Arabs settled in the tenth century; it had the Mohammedan dynasties of the Bahmanids (1347-1490) and Bijapur (1489-1686). Bengal was the scene of most active propaganda, and Islam was welcomed especially among the lower-caste Brahmins. Lower Bengal has been the scene of a great Mohammedan revival even in the last few years. Kashmir had a Mohammedan king in the fourteenth century; Islam became supreme in the time of Akbar, and to-day claims over 70 per cent of the population. In Baltistan there has been a Mohammedan population for over three centuries, and the faith is being carried by merchants from Kashmir, as well as from Persia, even into Tibet. In the various parts of India there are about 67,000,000 Moslems, the number of annual converts being estimated at about 600,000. It is

worth noticing, however, that in Agra only about one-tenth and in Delhi only about one-fourth of the population is Moslem, and these are prominent centres of Mohammedan power.

Mohammedanism penetrated into China from the south and from the west. Friendly relations were established between the caliphs and the emperors in the time of the Caliph Walid (705-717), when the general Kutaibah ibn Muslim sent ambassadors to the Chinese court. Later Moslem traders entered from Arabia, Bokhara, and Transoxiana. The first mosque was built in 742, in the capital city, Shensi, northern China. In 758, 4000 Arab soldiers were sent by the Caliph Al Mansur to aid the Emperor Sah-Tsung in crushing a rebellion; they remained in China and intermarried with the natives. The annals of the Tang dynasty (618-907) record the arrival of Moslems at Canton; there in the ninth century they lived as a separate community. They were joined later by other arrivals, and intermarried with the natives. Mohammedans entered the Province of Kansu (part of the Empire of Hoey-hu), and the Khan was converted, in the tenth century. The Ugurs, a Turkish tribe transferred to the Great Wall in the Tang dynasty, became Moslems in the ninth century. All of these Moslem communities formed centres for the spread of Islam throughout the Empire. Further accessions of Syrians, Arabs, and Persians followed the great Mongol conquest. Under the Mongol khakans Mohammedans were well treated and rose to positions of trust (in 1244 Abd al Rahman was head of the Imperial finances). At the beginning of the fourteenth century all the inhabitants of Yunnan were Moslems, and in every town throughout the Empire there was a special Moslem quarter. After the expulsion of the Mongols the Mohammedans avoided all external signs of their religion, and assimilated themselves as far as possible to the rest of the population, while keeping the essentials of their religion intact. Missionary efforts were continued quietly and slowly but surely; the only conversion in large numbers took place in 1770, when a revolt was put down in Sungaria and the 10,000 military colonists who were sent there all embraced Islam, and after a famine in 1790 in the Province of Kwangtung, when 10,000 children are said to have been bought and brought up as Moslems. There was a general revival of interest in the eighteenth century, when commercial relations were reestablished with the outside Mohammedan world. To-day there are about 12,000,000 Mohammedans in the Chinese Republic, of which three-fourths are in the provinces of Kansu and Shensi, in the northwest. As an example of the cities in the east, Peking has 20,000 Moslems, with 13 mosques.

The spread of Islam into the Malay Islands dates from the twelfth century, when more or less successful attempts were made to introduce it into Sumatra; in the fourteenth century the Shereef of Mecca sent missionaries to the island and succeeded in making many converts. In the fifteenth century the great Kingdom of Menang-Kaban had many converts, and the larger part of central Sumatra is now Moslem. On the Malay Peninsula the Kingdom of Malacca was converted in the thirteenth or fourteenth century; the Moslems of the peninsula to-day are said to be most strict in their religious practices, though extremely tolerant,

Converts have been made among the Siamese Buddhists of the north and among the wild tribes of the peninsula. In Java the first notable success of Islam took place in the fourteenth century, and in the following century the new faith was firmly established on the east coast. In the fifteenth century Radan Rahmat, nephew of the Hindu King of Majapahit, made many converts in Ampel and in other places on the east coast; at the same time conversions were made in the west. Radan Patah headed a confederacy which, in 1478, defeated the King of Majapahit, replacing the Hindu with a Moslem dynasty. To-day nearly the whole of Java is Mohammedan. In Celebes general conversion along the coast began in the seventeenth century. The Macassars were the first converts; they then, after much resistance, converted the Bugis, who likewise became propagandists. In the north the Kingdom of Balaang-Mongondou, which was Christian for centuries, was finally converted in 1844. The population of this Kingdom is now half heathen and half Moslem. The island of Sumbawa has had a Moslem population since 1540; Lombok was one of the scenes of conversion by the Bugis.

In the Philippine Islands there has been a long struggle between Christianity and Islam. In Mindanao and the Sulu Islands civilized Mohammedan tribes existed as early as 1521, when the Spaniards came to the islands. Owing to their obnoxious and ill-advised methods, the Spaniards could make no progress in the face of Islam. The Mohammedans, as elsewhere, learned the language of the people, adopted their customs and intermarried with them, thereby winning great success. The independent Kingdom of Mindanao had 360,000 Moslem subjects in the nineteenth century. The Sulu Islands have also been a Mohammedan stronghold. Among the lower classes in the northern islands Islam has not made much headway, as indeed has been the case throughout the archipelago. In New Guinea and the islands to the northwest of it progress has been made only on the coasts. In the archipelago as a whole, however, Islam is spreading. The religious orders, especially the Sanusiyyah, are very active.

It is almost impossible to give reliable figures of the total Mohammedan population of the world. According to a recent estimate (1915), the number may be placed approximately at 220,000,000. This is based in part on the latest available census reports, in part on official and private estimates of varying degrees of probability. The unwillingness of Moslem householders to give an account of the members of their harems interferes everywhere with scientific census taking, and in many lands where Mohammedan missions have been particularly active in recent times no census has ever been taken. The following figures can therefore only claim to be approximately correct. In Asia: Turkey, 15,000,000; Persia, 9,200,000; Afghanistan, 5,000,000; India (1911), 66,623,412; Russia (1911), 13,906,972; China, 12,000,000; Indo-China and Siam, 2,000,000; total in Asia, about 124,000,000; in the East Indies and other islands of the Pacific, about 35,000,000; in Africa: Egypt (1907), 10,336,826; Sudan, 3,000,000; Abyssinia, 5,000,000; Barca and Tripoli, 2,000,000; Tunis, 2,000,000; Algiers, 5,000,000; Morocco, 5,000,000; Liberia, 1,000,-

000; French West and Equatorial Africa, about 10,000,000; British West, East, Central, and South Africa, about 10,000,000; West and East German, Belgian, and Italian East Africa, about 3,000,000; total in Africa, about 56,000,000; in Europe: Turkey, Bulgaria, Servia, Albania, Greece, Austria, and Russia, about 5,000,000. It is significant that only about 31,000,000, or less than 15 per cent, of this Mohammedan population are found in politically independent Moslem states, viz.: in Turkey, 16,500,000; Persia, 9,200,000; Afghanistan, 5,000,000; while Great Britain has about 95,000,000, Holland about 30,000,000, France about 22,000,000, Russia about 14,000,000, China about 12,000,000, and Abyssinia about 5,000,000 Mohammedans.

MOHAMMEDAN SECTS. The movement which led to the division of Islam into opposing parties was at first a political one, though religious, theological, and philosophical questions soon arose which added to the complexity of the situation and caused a further subdivision into sects. Mohammed died without naming his successor; and while Abu Bekr was looked upon by many as the natural leader, others felt that Ali, who was not only the cousin and son-in-law but also a decided favorite of the Prophet, should be his successor. Among the Arabs, however, leadership was not a matter of inheritance but of election; and when Abu Bekr was chosen Caliph he received the recognition of all, including Ali. Omar's election likewise resulted in general satisfaction, although the Ommiads, who, even when they had accepted Islam, were still rivals of the Prophet's family, began to show their opposition to those who had been the Prophet's intimate companions. On Omar's death the caliphate was again denied to Ali, Othman being chosen. Othman's misrule, however, caused great dissatisfaction, and when he was assassinated Ali finally came to the caliphate. The hostility of the Ommiads, however, continued, and soon turned into open revolt, with Moawiyah, the Ommiad Governor of Syria, at its head. The question as to the right of succession, which was soon to cause the permanent separation of the whole Mohammedan world into Shiites and Sunnites, had even then presented itself in great seriousness, the followers of Ali claiming that only the Prophet's family had the right to the caliphate, the Ommiads opposing this claim.

There was also a third party, afterward known as the Kharijites (those who go forth), who held the old Arab view on the question of succession and were thus directly opposed, in principle, to the "legitimists." They were, in reality, in favor of a theocracy; and they claimed that any man might be called to the *imamah*, or leadership, even if he did not belong to the Koreish, or was not even a freeman, provided only that he was just and pious and fit in every other respect. As a result of this they also claimed that an unrighteous imam might be deposed, or even put to death; and furthermore, that there was no absolute need for any imam at all. Since Ali, however, united in his person the claims of heredity and of election, they were at first among his partisans. But when, at the battle of Siffin, Ali submitted to arbitration the decision of his right to the caliphate as against Moawiyah, they refused to stand by the decision and swear allegiance to either one or the other. Twelve thousand of them conse-

quently deserted Ali's camp in a body; they proclaimed "no rule but that of Allah alone." The Kharijites, though often defeated in this and succeeding caliphates, appeared again and again as the assailants of the established government.

After Ali's death, when Moawiyah had finally succeeded in establishing himself in control, he induced Hasan (q.v.), the elder son of Ali, to yield up his prerogatives. Ali's followers, however, refused to recognize Moawiyah and espoused the cause of Husain, Ali's second son. A bloody struggle followed, in which Husain lost his life. The division of the Mohammedans into Sunnites and Shiites was now fixed, and the Shiites, consistently developing the theory of legitimism, refused to recognize that there had ever been any legitimate caliph between Mohammed and Ali. See SHIITES; SUNNITES.

Despite the fact that with Ali's death and the Ommiad supremacy the question as to the caliphate was settled, the Shiites still looked to the descendants of Ali as their religious leaders, or imams. But even among the Shiites themselves unanimity in regard to the imamate did not long prevail, and discussions of a theological nature likewise proved a source of trouble. The impulse to such discussion came from Persia, into which Mohammedanism had well penetrated, and which, since the principle of hereditary succession had always obtained there, naturally espoused the cause of Ali.

Down to the sixth imam, Ja'far al Sadik (died 765), there was agreement among the Shiites; Ja'far, however, had two sons, Ismail and Musa al Kasim. The former, as the elder, should have been successor to the imamate. The father, however, is said to have declared in favor of Musa; and on Ja'far's death a division ensued between the adherents of Ismail—the Ismailians (*Ismā'iliyyah*)—and those of Musa, the greater part of the Shiites following the latter.

From this time on the question of the imamate received more and more a theological, mystical treatment. The notion of the imam, in general, was that of an ever-living, though at times hidden, supreme guide of the people, who after a time is restored to humanity, or at least to the believing part of it. (See MAHDL.) The Ismailian doctrine was that the imam had been revealed in Ali, whereas during the preceding ages the imams had been concealed; that Ali himself had reappeared in every imam till the time of Ismail, and had then become invisible again; but that he would descend some day "from the clouds" to unite all believers and to restore the pure faith. The real importance, however, of the Ismailians, who existed unobserved for some time, dates from Abd Allah ibn Maimun, whose father had been executed for professing materialistic doctrines and trying to turn people away from the doctrines of Islam. Abd Allah seems to have practically carried out his father's notions. Aided by favorable circumstances, he matured a plan which, for the boldness and genius of conception and for the energy and vigor with which it was carried out, has not many parallels in history. Nothing less was contemplated than the union of the Arabic conquerors and the many races they had subjected since Mohammed's death, and the enthronement of what afterward was called "Pure Reason" as the sole deity to be worshiped. The advanced should be free of all so-called religious fetters,

which, as symbols and allegorical actions, should be laid all the heavier on the necks of the less advanced strata of society. The "believers" and "conquerors" were to be made missionaries for unbelief and the implements for the destruction of their own empire. With an extraordinary knowledge of the human heart and human weakness, he offered devotion to the believer; liberty, if not license, to the "free in spirit"; philosophy to the "strong-minded"; mystic hopes to the fanatics; miracles to the masses. The Messiah whom Abd Allah preached stood higher than Mohammed himself, and, though he did not reject the Koran, he yet contrived to allegorize and symbolize away nearly all its narratives and precepts. An elaborate secret doctrine was worked out, into which the members of the sect were initiated by degrees. Missionary schools were established, and the instruction given to the young missionaries was artfully designed to win over not merely all the different Mohammedan sects, both Sunnites and Shiites, but also Jews and Christians. By the time the neophyte had completed the ninth and concluding degree of initiation all his earlier religious beliefs had been explained away. He had learned that no miracle had ever been performed; that the prophet is merely a man distinguished by his purity and the perfection of his intelligence; and that this purity of his intelligence is precisely what is called prophecy. God throws into the prophet's mind what pleases Him, and that is what is understood by the Word of God. The prophet clothes this Word afterward with flesh and bones and communicates it to the multitudes. He establishes by this means the systems of religious institutions which appear to him the most advantageous for the ruling of men; but these institutions and behests are but temporary and intended for the preservation of order and worldly interests. No man who has knowledge need practice any single one of them; to him his knowledge suffices.

The creed of the Ismailians was gradually built up and many changes were introduced into it at different times; from it sprang various other sects, notably that of the Karmathians. This sect sprang up in the ninth century, under the caliphate of Al Mutamid, and by a combination of extraordinary circumstances succeeded in establishing itself for a time as a political power which threatened to overturn the caliphate itself. The practical exertions of Abd Allah ibn Maimun and their wonderful results had soon attracted the attention of the authorities. Obligated to flee from place to place, he sought refuge successively in Karaj, in Ispahan, in Ahwaz, in Basra, finally in Salamia, in Syria, where he died, leaving his son Ahmad his successor as chief of the Ismailians. One of Ahmad's missionaries (or, according to other accounts, a convert of a missionary) was Al Karmat. He lived in Irak, and was a fit man to carry out the plans of Abd Allah ibn Maimun. His house in Kufa became the centre whence all the missionaries were sent forth and where all the details of a great conspiracy were directed. One of the most noted of the missionaries, Abu Said, won over a great part of the people of Bahrein, the majority of whom were not Mohammedans and were impatient of Moslem rule. In 900 Abu Said defeated an army of 10,000 men sent against him by the Caliph and captured the latter's general. He then gained undisputed possession of the whole country, de-

stroyed the old capital, Hajar, and made Al Hasa, his own residence, the capital. At the same time two other Karmathian chieftains arose to threaten the court of Bagdad, one near Kufa and the other in Syria. The former was defeated, captured, and tortured to death. The latter at first defeated the Governor of Damascus most ignominiously, but in 907 the Caliph's general, Wasif, won a decisive victory and made an end of this branch of the Karmathians. Meanwhile both Al Karmat and Abu Said disappear from view and the leadership passed to Abu Said's son, Abu Tahir. In 923 he seized Basra. The next year he pillaged the Meccan caravan and plundered Kufa. In 927 he gained a decided victory over the Caliph's troops in Irak. In 929 he appeared at Mecca at the head of his army, when the pilgrimage was at its height. Attempts to buy him off were unavailing, and a fearful massacre, lasting several days, ensued. The holy places were desecrated and the Black Stone was carried off. Abu Tahir may have thought that this act would destroy the sanctity of Mecca and the Kaaba in the eyes of the faithful, but if so he was mistaken; the caravans still went on their usual annual pilgrimage as often as he did not restrain them by force. In 939 the emir of the pilgrimage, Abu Tahir's personal friend, persuaded him to conclude a treaty by which the pilgrimage was again allowed, on payment of five dinars for every camel and seven for every horse. The Black Stone was returned for an enormous ransom in 950, seven years after Abu Tahir's death. At that time the Karmathians were masters of Irak, Syria, and Arabia. Little of importance is heard of them again till 990, when they were defeated before Kufa—an event which seems to have made an end of their dominion in Irak and Syria. About 993 they were again defeated by Asfar, and their chief lost his life. They retreated to Al Hasa, where they fortified themselves, while Asfar marched against Al Katif, captured it, and carried away all the baggage, slaves, and animals of the Karmathians of that town and then retired to Basra. The Karmathians retained Al Hasa for a considerable time, but nothing further is heard of them in history. In 1862-63 Palgrave found remnants of them still living in Najran and in Bahrein and Oman, and their hatred of Islam seemed in no wise abated.

Concerning the special beliefs of the Karmathians, so far as they have been preserved, their system seems in the beginning to have been merely a sort of reformed Islam. The prophet Al Karmat, it was held, had brought a new law into the world, by which many of the tenets of Mohammedanism were altered, many ancient ceremonies abrogated, new forms of prayer introduced, and an entirely new kind of fast inculcated. Wine and a few other things prohibited by the Koran were allowed. Certain of the precepts of the book were turned into mere allegories. Instead of tithes they gave the fifth part of their property to the imam. Prayer was merely the symbol of obedience to the imam. Fasting was the symbol of silence, or rather of concealment of religious doctrine from the stranger.

Another offshoot of the Ismailians is the sect known as Assassins (*hashshishin*, a name derived from *hashish*, a drink drawn from hemp, to which the members of the sect were addicted). The sect owed its origin to Hasan ibn Sabbah,

a Persian fanatic, who at the beginning of the eleventh century formed a secret society, the members of which swore blind obedience to their leader, known to history as the "Old Man of the Mountain." From their mountain fastnesses in Persia (Alamut) they bade defiance for two centuries to the strongest armies sent against them by Moslem rulers, and they were reduced to harmlessness only by the Mongol invasion (1255). They owed their power chiefly to the perfection of their secret organization and to the unscrupulousness with which they carried out their plans. They were perhaps best known for the countless assassinations of which the members of the sect were guilty. From Persia they spread into Syria and Asia Minor. While Hasan ibn Sabbah was still alive the Governor of Aleppo had invited them to settle in his territory, and they had taken possession of various mountain fastnesses from which they were enabled to play an important rôle in the Crusades. There are still a few Assassins in the neighborhood of Homs. See ASSASSINS.

When the Assassins came into Syria they found the mountain regions around Hama in possession of the Nosairians, apparently a remnant of the ancient Syro-Phœnician population of the land, which had preserved its own religion through the centuries despite all the efforts of Christianity. Most of the Nosairians displayed a bitter enmity towards the Ismailians, though some embraced their cause, and at the end of the tenth century there was a strong infiltration of Ismailian doctrines into the general Nosairian religious system. In fact, the Nosairian religion, without being identical with Ismailism, shows many strong points of analogy with it. The Nosairians are divided into four sects—*Haidariyyah*, *Kalaziyyah* (or *Kamariyyah*), *Shamaliyyah* (or *Shamsiyyah*), and *Ghaibiyyah*. The *Shamaliyyah* and *Kalaziyyah* are the most important. They all possess the same religious book (*Kitāb al Majmū'*), and differ from one another only on points of minor importance. The chief variations from the Ismailian doctrines are these: while the Ismailians taught that of the seven cycles corresponding to the various manifestations of the deity, the sixth, that of Mohammed, was closed with the death of Ja'far, and the seventh, which was to be characterized by the coming of the Mahdi, or Messiah, was thereby opened, the Nosairians taught that the seventh was closed by the seventh divine manifestation, that of Ali. Furthermore, the Nosairians recognized Musa instead of Ismail as the successor of Ja'far al Sadik. This was probably due to the fact that they had accepted as their leader Mohammed ibn Nosair, who was a partisan of the eleventh imam, a descendant of Musa; and with Musa (died 799), who was the seventh imam, they considered the number of imams to have been completed. Another striking characteristic of the Nosairian belief was their attitude towards the *natiks*, the various divine incarnations. The Ismailians held that all the *natiks* excepting Mohammed were superior to their *assas* (foundations) or *samets*, while the Nosairians placed all of their *assas* above the *natiks*. But of greatest importance was the degree to which they carried their doctrine of the divinity of Ali. Ali, while he confided the *word* to Mohammed, had reserved the *ma'na* (meaning) for himself. Ali is their god in heaven and their imam on earth; he is concealed from man because of his divine na-

ture; he is not created and has no attributes; his essence is the light. He created Mohammed to be the veil with which he conceals himself, the place in which he resides, the bearer of his name. Mohammed in his turn created Salman al Farisi to be the *bab*, or gate—the one through whom man communicates with the deity, and who is charged by the divinity with the making of his propaganda. Salman created the five "incomparables" (in reality five planets) which created the world. See NOSAIRIANS.

Besides the Assassins and Nosairians, a third sect with Ismailian tendencies found refuge in the Syrian mountain districts—the Druses. When Abd Allah ibn Maimun found himself persecuted by the authorities he fled to Syria and continued to preach there the coming of the Mahdi. His son Mohammed continued the propaganda, and finally the Mahdi himself appeared among the Berbers of north Africa. This Mahdi founded the dynasty of the Fatimites (909), the sixth of which, Hakim, probably under Ismailian influence, declared himself an incarnation of the deity. He disappeared mysteriously, which helped to support his contentions. Hamza and Al Darzi (whence the name Druse) were his propagandists (*dā'i*), and gained many followers in the Lebanon mountains. It is interesting to note that one of Hamza's treatises was intended as a refutation of the Nosairian doctrines, and tried to show that Hakim, not Ali, was God. See DRUSES.

A sectary whose name has become familiar through the use made of his story by Thomas Moore in his *Lalla Rookh* was Hakim ibn Allah, better known as Al Mokanna (the veiled) because he wore a mask to conceal the disfigurement of his face. He lived in the eighth century and headed a revolt against the Mahdi, the third Abbaside Caliph. He claimed to be an incarnation of the deity and won repute as a miracle worker. He made many followers and for a time maintained himself against the Caliph, but was ultimately defeated and committed suicide. He left word that he would reappear as a gray man riding a gray beast, and his followers long expected his coming. They dressed only in white. See HAKIM IBN ALLAH.

All of these Shiite sects were political, or at least politico-religious, sects, whose doctrines turned about the question of the imamah. But there were in Islam also some sects purely theological, differing on such questions as predestination, free will, belief, idea of God, and revelation—points upon which Mohammed had not expressed himself clearly. It was again in Persia that the movement looking towards independent religious views took its rise, under the influence of Greek philosophy.

The most important of these theological or philosophical sects was perhaps the rationalistic sect of the Mutazilites (*Mu'tazilah*, from *'azala*, to separate). They were called also Muattalites—i.e., those who divest God of His attributes (Ar. *Mu'attilun*)—and Kadarites—i.e., "those who hold that man has a free will (Ar. *kadar*) and deny the strict doctrine of predestination." The first beginnings of this sect are traced to Mabad, who already in the time of Mohammed himself began to question predestination by pointing out how kings carry on unjust wars, kill men, and steal their goods, and all the while pretend to be merely executing God's decrees. The real founder of the sect, as such, however, was Wasil ibn Ata (c.745). He denied God's

"qualities," such as knowledge, power, will, life, as leading to, if not directly implying, polytheism. As to predestination, he held that it existed only with regard to the outward good or evil that befalls man, such as illness or recovery, death or life, while man's actions are entirely in his own hands. God, he said, had given commandments to mankind, and it was not to be supposed that He had at the same time preordained that some should disobey these commandments and that, further, they should be punished for it. Man alone is the agent in his good or evil actions, in his belief or unbelief, obedience or disobedience, and he is rewarded according to his deeds. These doctrines were further developed by Wasil's disciple Abu'l Hudhail al Allaf (died c.845), who did not deny so absolutely God's "qualities," but modified their meaning in the manner of the Greek philosophers, holding that every quality was also God's essence. The attributes are thus not without but within Him, and so far from being a multiplicity they merely designate the various ways of the manifestations of the Godhead. God's will he declared to be a peculiar kind of knowledge, through which God did what He foresaw to be salutary in the end. Man's freedom of action is possible only in this world. In the next all will be according to necessary laws immutably preordained. The righteous will enjoy everlasting bliss, and for the wicked everlasting punishment will be decreed. A dangerous doctrine of this system was the assumption that before the Koran had been revealed man had already come to the conclusion of right and wrong. By his inner intellect, Abu'l Hudhail held, everybody must and does know—even without the aid of the divinely given commandments—whether the thing he is doing be right or wrong, just or unjust, true or false. His belief in the traditions was also by no means an absolute one; indeed, it was held by the Mutazilites that even some of the earliest "traditioners" may have told untruths, or have been imposed upon, and every tradition was to be rejected which was opposed to the Koran, to more authentic traditions, or even to mere reason. As to the Koran, although its authority was recognized, it was held to be created and not an object of worship.

Many were the branches of the Mutazilites. There were, apart from the disciples of Abu'l Hudhail, the *Jubbaians*, who adopted Abu Ali ibn Abd al Wahhab's (Al Jubbai, died 914) opinion to the effect that the knowledge ascribed to God was not an "attribute"; nor was his knowledge "necessary"; nor did sin prove anything as to the belief or unbelief of him who committed it, who would anyhow be subjected to eternal punishment if he died in it. Besides these, there were the Hashimites, the disciples of Abu Hashim Abd al Salam, son of Al Jubbai, who held that an infidel was not the creation of God, who could not produce evil. Another branch of the Mutazilites were the disciples of Ahmad ibn Habit (or Hait), who held that Jesus was the eternal word *incarnate*, and that he had assumed a real body; that there were two gods or creators, one eternal—viz., the Most High God—and the other not eternal—viz., Jesus—not unlike the Arian and Socinian theories on this subject; that there is a successive transmigration of the soul from one body into another, and that the last body will enjoy the reward or suffer the punishments due to each

soul, and that God will be seen at the resurrection with the eyes of understanding, not of the body.

Four more divisions of this sect are mentioned—viz., the *Jāhiziyyah*, whose master's (Amr ibn Bahr al Jahiz) notion about the Koran was that it was "a body that might grow into a man, and sometimes into a beast, or to have, as others put it, two faces, one human, the other that of an animal, according to the different interpretations." He further taught that the damned would become fire and thus be attracted by hell; also that the mere belief in God and the Prophet constituted a "faithful one." Of rather different tendencies was Isa al Muzdar, the founder of the branch of the *Muzdariyyah*. He not only held the Koran to be uncreated and eternal, but so far from denying God the power of doing evil, he declared it to be possible for God to be a liar and unjust. Another branch was formed by the *Bishriyyah* (from Bishr ibn al Mutamir), who, while they carried man's free agency rather to excess, yet held that God might doom even an infant to eternal punishment—all the while granting that He would be unjust in so doing. The last of these Mutazilite sectarians to be mentioned are the *Thumamiyyah*, who held, after their master, Thumamah ibn Ashras, that sinners will undergo eternal damnation and punishment; that free actions have no producing author; and that, at the resurrection, all infidels, atheists, Jews, Christians, Magians, and heretics will be returned to dust and will not enter either Paradise or hell. For the scientific development which the doctrines of the Mutazilites begot, and which resulted in the encyclopædic labors called "The Treatises of the Sincere Brethren and True Friends," see SINCERE BRETHREN.

Allied to the Mutazilites in their view of the divine attributes, but diametrically opposed to them in their view of predestination, were the Jabarites (Necessarians). They held that man's every act is the result of the will of God and that there is no human responsibility. There are pure Jabarites and middle Jabarites.

Opposed to both the Mutazilites and the Jabarites were the Sifatites ("Attributists"). With them God's attributes, whether essential or operative, or declarative or historical—i.e., used in historical narration (eyes, face, hand); anthropomorphisms, in fact—were considered eternal. But here again lay the germs for more dissensions and more sects. Some, taking this doctrine of God's attributes in a strictly literal sense, assumed a likeness between God and created things, while others gave it a more allegorical interpretation, without, however, entering into any particulars beyond the reiterated doctrine that God had no companion or similitude. The different sects into which the Sifatites split were, first, the *Asharians*, so called from Abu'l Hasan al Ashari (883-951), who, at first a Mutazilite, disagreed with his masters on the point of God's being bound to do always that which is best. He became the founder of a new school, which held (1) that God's attributes are distinct from His essence, and that any literal understanding of the words that stand for God's members in the Koran is reprehensible; (2) that predestination must be taken in its most literal meaning—i.e., that God preordains everything. The opinions on this point of man's free will are, however, much divided, as, indeed, to combine a predestination which ordains every act

with man's free choice is not easy. The middle path, adopted by the greater number of the doctors, is expressed in this formula: there is neither compulsion nor free liberty, but the way lies between the two, the power and will being both created by God, while the merit or guilt is imputed to man. Regarding mortal sin, it was held by this sect that if a believer die guilty of it without repentance, he will not, for all that, always remain a denizen of hell. God will either pardon him or the Prophet will intercede in his behalf. Further, he in whose heart there is faith of but the weight of an ant shall be delivered from hell fire. From this more philosophical opinion, however, departed a number of other Sifatian sects, who, taking the Koranic words more literally, transformed God's attributes into grossly corporeal things; the *Mushabbihites*, or Assimilators, conceived God to be a figure having limbs like those of created beings, either of a bodily or a spiritual nature, capable of locomotion, ascent, or descent, etc.

The *Murjites*, likewise regarded as a sect of the Sifatites, are sometimes regarded as the representatives of the whole sect, for their doctrines were very widespread, and they counted among them such men as Said ibn Jubair. The sect arose in Syria or north Arabia. It is worthy of note that some of the Murjites hold views approaching closely not only to those of the Mutazilites and Jabarians, but even, with reference to the imam, to those of the Kharijites.

Aside from the sects which owed their rise to political or theological differences, there were others in Islam which sprang from mysticism and asceticism. It is true that the secluded life of the monastery or hermitage was forbidden to Mohammedans by the Koran; nevertheless as early as the first and second centuries of the Hejira a sect of mystics had come into existence the distinguishing external mark of whom was a garment of coarse wool (*suf*), such as had been worn by the founder of the sect, Abu Said ibn Abul Khair (815); they came therefore to be known as Sufis. Their main idea was that to attain to a nearer friendship with God there was necessary a certain course of life which, without demanding entire withdrawal from the world, insisted that religious laws be scrupulously observed and that, God being loved above all else, everything worldly be despised. Merx has shown that this Oriental mysticism goes back finally to Palestine and Neoplatonic philosophy, having come to the Mohammedans through the writings of Syrian philosophers. The main stronghold of the sect, however, was, like that of so many others, in Persia, where Sufism made many converts from among the heterodox and also gradually altered its original character. At first the Sufi had aimed by ascetic practices and religious contemplation to enter into a state of ecstasy in which he might attain to a real knowledge of the deity; but later Sufism became in certain regards a real pantheism, and its adherents in the ecstatic state felt themselves united with, and a part of, the Godhead. Sufism had its organization like other religious orders; the religious meetings were called *dhikrs*; novices (*murid*) were held to regular and exacting duties, as well as to strict compliance with the commands of the sheikh.

A later development (twelfth and thirteenth centuries) of mysticism is represented by the various orders of Dervishes—*Kadiriyyah*, *Ri-*

faiyyah, *Maulawiyyah*, etc.—each with its own garb and symbols, rules of faith and practice as determined by its founder. Their *dhikrs* take place once or oftener every week in their religious houses (*takkiyyah*). There are howling, whirling, and dancing dervishes, and in some orders the members become so insensible to physical sensation while in the state of ecstasy that they swallow glass or glowing coals, and often wound themselves severely in other ways. Most dervishes follow a trade and do not withdraw from the affairs of life. There are also some begging dervishes, who have no dwelling places and live entirely from alms. See DERVISH.

Babism (q.v.) and *Bahaism* may be regarded as the last of the Shiite religious movements in Islam, though the former only outwardly conforms to the religion of Mohammed and the latter has practically developed into a distinct religion rather than a Moslem sect. Mirza Ali Mohammed ibn Radhik was the founder of Babism. He was born at Shiraz, March 26, 1821, proclaimed himself as the *bab al din* (door to the religion), June 11, 1844, and was shot to death at Tabriz, July 8, 1850. Ali Mohammed at first appeared only as a reformer of Islam; but as he declared himself to be the mirror in which God is reflected so that every one can see Him, it became evident that he regarded Mohammed not less than Moses and Jesus as superseded. Both in its theology and its social ethics Babism differs from the orthodox schools in Islam. Its pantheism is of such a nature that it clearly connects itself with Sufism, but many of its practical precepts are at least less obviously related to Moslem mysticism. Ali Mohammed wrote several works, extant in manuscripts, but not yet published in the original Arabic and Persian. Only the Arabic *Bayan* has been translated into French by Nicolas. At Teheran the two half brothers Mirza Yahya Nuri, called *Subh i Azal* (the dawn of eternity), and Mirza Husain Ali Nuri, later known as Baha Allah (the glory of Allah), became converts to Babism. Husain Allah Nuri was born in Mazenderan, Nov. 12, 1817, and was 30 years of age when he became a follower of Bab, whom he never saw. Mirza Yahya had been designated by the Bab as his successor and was recognized as such by the Babis, but in 1867 Husain Ali Nuri claimed to be "he whom Allah shall manifest," and that Bab was only his herald and forerunner. This led to a schism, and since that time there are two sects, the Bahais and the Azalis. The strife between the two parties, in which many were killed, forced the Turkish government to intervene. Subh i Azal was sent to Famagusta, Baha Allah to Akka. The former looked upon the revelation in Bab as final, at least for a millennium, and kept in touch with Islam. The latter appealed to all men, not only the Moslems, sought a common ground on which all religions could meet, and emphasized the distinction of his "manifestation" and teaching from Babism. Among his writings are *Ikan*, translated into French by Dreyfus and Habib Allah in 1904; *Kitab i Akdas*, translated into Russian by Tumanski in 1899; and some epistles, translated into English by Browne in 1889. Baha Allah died in 1892, and differences as to the succession immediately arose between his two sons, Abbas Effendi, also called Abdu'l Baha (the servant of the glory), or Ghuzn i A'zam (the most mighty branch), and Mirza Mohammed Ali,

called Ghuzn i Akbar (the most great branch). Abbas Effendi seems to have claimed that the revelation was not ended, while Mohammed Ali and his followers abided by the manifestation in Baha Allah. Thus Bahaism in its turn split up into two rival sects. In recent years that of Mohammed Ali has on the whole decreased, though there have been some notable accessions from the other camp. Abbas Effendi has had a larger following. During the years when he was kept under surveillance in Akka many men and women made pilgrimages to this "holy city" to see "the Master," among them not a few from England and America. The first missionaries of the faith in America were Khairallah, who afterward espoused the cause of Mohammed Ali, and Abu'l Fazl, who was sent over to prevent the schism from spreading. In 1913 Abbas Effendi visited the United States. His *Mufawazat* (outpourings) were translated by Dreyfus into French and by Laura Barney into English in 1908. He also seems to be the author of *The Traveler's Narrative*, translated by Browne. Numerous messages, designated as "tablets," sent to believers, also set forth his ideas on a variety of subjects. Although his works contain no new development of thought, and he has made no further claim for himself than to be "the servant of the glory," the fact that through him Bahaism has become known and has won a number of disciples in England, America, Germany, and France, to whom he is the last of the prophets, the organ of revelation, the final "manifestation," has enhanced his prestige, and probably also affected to some extent the emphasis of his teaching. Religious toleration, search for the essence of truth in different religions, opposition to the *jihād* and war in general, demand for certain social reforms, a more or less pronounced mysticism, and self-effacing devotion to a leader characterize Bahaism and Babism alike. In politics the Persian Bahais seem to have supported the court and favored the interests of Russian and English diplomacy, while the Azalis have espoused the popular cause of the Nationalists.

Such are the numerous sects against which orthodox Mohammedanism has been forced to contend; but, although Shiite doctrines more than once threatened to gain the ascendancy, Sunnism has always remained the victor in the end. The four sects into which the Sunnites are divided—the *Hanbalites*, *Malikites*, *Hanifites*, and *Shafi'ites*—differ only in regard to a few points of minor importance connected with religious observances and civil and religious jurisprudence. These sects have remained almost without change since their foundation under the Abbaside dynasty. Nevertheless, certain innovations had crept into the life of orthodox Mohammedans, principally an exaggeration of the reverence paid to the numerous saints, which amounted often to actual worship. It was against such abuses, as well as against all forms of luxury in everyday life, tobacco smoking, etc., that Abd al Wahhab and his followers, the Wahabis, arose in the middle of the eighteenth century. From Nejd they carried on an iconoclastic warfare throughout the country; they conquered Mecca and Medina, and in destroying the many sanctuaries there did not even spare the grave of Mohammed. Previous to this they had taken Kerbela, a holy city of the Shiites in Mesopotamia. They were defeated finally by Egyptian troops, and driven back into the in-

terior of the peninsula. But the Wahabite state, with Riyad for its capital, is still independent and, according to recent accounts of travelers (1915), more powerful than it has been for a long time, while as a sect the Wahabis have spread their influence into Africa and India. See WAHABIS.

MOHAMMED BEN MOHAMMED BEN YAHAYA, yā'hā-yā, ABUL WEFĀ, or WAFĀ (940-998). An Arabic mathematician and astronomer, born at Buzjan and generally known as Abul Wefā. He translated and commented upon works of several Greek mathematicians and calculated a table of sines at intervals of half a degree and also a table of tangents, which, however, was used only for determining

the altitude of the sun. The ratio $\sin a / \cos a$ was called by him the shadow. He is, however, most famous for having made the oldest known attempt to solve geometric problems with only one opening of the compasses. He wrote a book containing 12 chapters on geometrical constructions. Our knowledge of this work is due to a Persian translation of an Arabic manuscript, written by a pupil of Abul Wefa. The problems may be divided into three groups: (1) those dealing with the solution of geometrical problems by one opening of the compasses; (2) to divide a given square into a given number of squares and to construct a square equal to a number of given squares; this is done by juxtaposition and not by the Pythagorean method; (3) problems having for aim the construction of regular polyhedra. In the problem duel between Tartaglia (q.v.), on one hand, and Cardan (q.v.) and Ferrari, on the other, problems of the first group were given for solution and appear in the works of Leonardo da Vinci and Cardan. They also occur in several other works of the sixteenth century, but first found accurate scientific expression in Steiner's *Geometrische Constructionen*, etc. (1883). Consult Volpeke, *Journal Asiatique*, vol. v (5th series, Paris, 1855), and Cantor, *Geschichte der Mathematik*, vol. i (Leipzig, 1900).

MOHAMMED KUDAH BUNDAH KHAN, *kou'da būn'dā kân*. See MONGOL DYNASTIES.

MOHAMMED'S COFFIN. See MAHOMET'S COFFIN.

MOHAMMED, SIDI. See SIDI MOHAMMED.

MOHAMMERAH, *mô-hâm'mâ-râ*. A town in southwest Persia, Province of Khuzistan, situated on a canal leading from the Karun River to the Shat el Arab, 35 miles from the Persian Gulf (Map: Asia, Central, C 7). The harbor is good, and the town has had an active trade since the opening of the Karun to international navigation in 1889. Pop., 15,000.

MOHAUNT. See HIBISCUS.

MOHAVE, *mô-hâ'vâ*. An interesting tribe of Yuman stock (q.v.), residing along both banks of the lower Colorado River, in Arizona and California. Their popular name, corrupted from *hamok-habi*, signifies "three mountains," in allusion to the three buttes known as the Needles, which they regard as the central point of their ancient territory. They are agricultural, although somewhat nomadic in habit, and in physical type they rank among the finest specimens of the American aborigine. They live in low wickiups of brushwood covered with sand, make pottery and baskets, and cultivate corn, pumpkins, melons, and beans, which, with fish and mesquite beans, give them an abundant subsistence. They practice tattooing and cremate their dead. They have certain hereditary family names and a chiefship hereditary in the male line, but do not seem to have the true clan system. Consult A. L. Kroeber, "Preliminary Sketch of the Mohave Indians," in *American Anthropologist*, vol. iv (N. S., New York, 1902), and P. E. Goddard, "Indians of the Southwest," in *American Museum of Natural History, Handbook Series No. 2* (ib., 1912).

MOHAVE DESERT. A desert region in

south California, lying principally in San Bernardino County (Map: California, J 7). It is a part of the Colorado Desert (q.v.), although the two names are often used synonymously.

MO'HAWK (New England Algonquin name, *Maqua, Mahaqua*, Bear; they call themselves *Ganiega-rono*, Bear People, or Flint People). The leading tribe of the Iroquois (q.v.) Confederacy and formerly occupying the lower Mohawk River valley in New York. They were considered the keepers of the eastern door or frontier of the long house of the Confederacy, the Seneca being assigned the duty of guarding the western door. The Mohawk territory was supposed to extend northward to the St. Lawrence, eastward to the country of the Mahican and Wappinger along the Hudson, and southward to the watershed of the Delaware River and the Catskill Mountains, where they bordered upon the Delaware and Munsee. Their geographic position thus brought them into early and intimate contact with the Dutch and English settlers, from whom they procured the firearms which soon made their very name a terror to the remoter tribes. This exposed situation, however, caused them to suffer much more than their confederates in the Colonial wars, so that their seven villages of 1644 were reduced to five in 1677, some whole clans seeming to have been wiped out. See IROQUOIS.

MOHAWK RIVER. The largest affluent of the Hudson. It rises in the sandy hills south of Boonville, Oneida County, and about 40 miles from the east end of Lake Ontario, flows southward until it reaches the city of Rome, then turns eastward, and continues in nearly that direction until it enters the Hudson at Cohoes (Map: New York, F 5). Its total length is about 140 miles, and its drainage area embraces 3470 square miles. Its course lies chiefly in the celebrated Mohawk valley, one of the most beautiful and fertile agricultural regions in the United States. In Colonial times the valley was the main highway to the Great Lakes, and during the Revolution a bitter contest was waged between the American and British forces for its control. There are many thriving manufacturing cities along the Mohawk, which is paralleled by the Erie Canal and by the New York Central and the West Shore railroads, forming a great trade route between the Atlantic seaboard and the West. See NEW YORK.

MOHE'GAN (dialectic form of *Mahican*, from which tribe the Mohegan were originally an offshoot). An Algonquin tribe formerly residing chiefly upon the Thames River in eastern Connecticut and claiming dominion by conquest over several smaller adjoining tribes, not all of which, however, admitted the claim. They seem to have been an eastern extension from the Mahican (q.v.) of the Hudson, while the warlike Pequot (q.v.) were in turn a branch of the Mohegan. At the period of the first settlement of Connecticut the two last-named tribes formed one body under the rule of Sassacus. Uncas, a subordinate chieftain, rebelled against him and assumed a distinct authority as the leader of a small band on the Thames, near the present Norwich. This band became known in history as the Mohegan, while those remaining with Sassacus were distinguished as Pequot. In the struggle between the Pequot and the colonists Uncas aided the English, and in consequence, on the destruction of the Pequot tribe in 1637, the greater part of the survivors were placed

under the dominion of the Mohegan chief, who thus obtained control of the territory of both tribes. He took such care to strengthen his power with the English that after the death of King Philip in 1676 the Mohegan were the only important tribe remaining in southern New England. As the settlements extended they sold most of their lands, retaining only a small reservation on the Thames River in New London Co., Conn., centring about their village, Mohegan. The villages of Groton and Stonington, occupied chiefly by the remnants of the conquered Pequot, were considered also as under Mohegan jurisdiction. They rapidly dwindled when surrounded by the whites, many joining the kindred mission bands at Scaticook and Brotherton in New York. The rest continued to reside at Mohegan, until now they are so mixed with negro and white blood that they have practically lost their identity, although they still retain official State recognition. In 1705 they numbered 750 at Mohegan, reduced to 206 in 1774, 69 in 1809, and 22 in 1910. Consult F. G. Speck, *Notes on the Mohegan and Niantic Indians* (New York, 1909).

MOHILEV, mô-hè-lyěf'. A government of European Russia consisting of 11 districts and bounded by the Government of Vitebsk on the north, Smolensk on the east, Tchernigov on the southeast and south, and Minsk on the west (Map: Russia, D 4). Area, 13,551 square miles. The northern part of the government is slightly elevated, forming the watershed between the Dnieper and the Dîna. The southern and larger part belongs to the region of Polissie (q.v.) and is low and partly marshy. The government is well watered; the Dnieper and its tributary the Sozh are the chief rivers. Mohilev has a moderate but rather damp climate, and in the low and marshy parts fever is prevalent. Agriculture, which is the principal industry, is carried on by the most primitive methods and famines are not infrequent. The live stock is of a very inferior breed. Gardening is carried on extensively in the vicinity of the towns. The forests, covering more than one-third of the total area, yield turpentine and charcoal and supply the material for the production of wood implements, wagons, etc., which are manufactured on a small scale. In addition there are produced paper, oil, wire nails, flour, glass, matches, etc. The trade is largely in the hands of the Jews. Pop., 1909, 2,164,800; 1913, 2,333,300. Capital, Mohilev (q.v.). In early times the present Province of Mohilev belonged to the Principality of Smolensk. Annexed in the fourteenth century to Lithuania, it afterward became part of the Polish monarchy and was annexed to Russia at the first partition of Poland in 1772.

MOHILEV. The capital of the Government of Mohilev in west Russia, situated on both banks of the Dnieper, 483 miles south of St. Petersburg and 375 miles southwest of Moscow (Map: Russia, D 4). It lies in a picturesque region and has a number of interesting buildings. The Public Park, the Roman Catholic cathedral, in Greek style, whose corner stone was laid in 1780 by Catharine II and the German Emperor Joseph II, the town hall (1679) with an octagonal tower, and the new theatre are among the centres of interest at Mohilev. There are also some interesting monasteries, numerous churches of different denominations, and a museum with noteworthy collections. The

educational institutions include two Gymnasias, two theological seminaries, several special schools, a manual-training school, and a public library. Mohilev produces largely leather, linseed oil, flour, and tobacco. A considerable part of its inhabitants are engaged in gardening and fishing. Pop., 1911, 54,058, of whom more than half were Jews.

MOHILEV. The capital of a district of the same name in the Russian Government of Podolia, situated on the Dniester, 89 miles east-southeast of Kamenetz-Podolsk (Map: Russia, C 5). The inhabitants are chiefly engaged in gardening and the transit trade in agricultural products and lumber with Galicia and Odessa. The town has several educational institutions. Pop., 1897, 22,100; 1910, 32,604, over one-half Jewish.

MOHL, môl, HUGO VON (1805-72). A German botanist. He was born in Stuttgart, a brother of Julius and Robert von Mohl, was educated in the classics at the Gymnasium at Stuttgart, and studied medicine at the University of Tübingen (1823-28). After making investigations at Munich (1828-32), he served as professor of physiology in the Academy (1832-34) and University (1834-35) of Bern, and finally was professor of botany at Tübingen (1835-72). There were two distinct periods in his career. During 1827-45 he was mainly concerned with the anatomy of plants, in which he was the leading investigator. During 1845-72 he was concerned chiefly with the development of organs and tissues, and was specially interested in cell formation. His contributions to botanical knowledge fall into three categories. In phytotomy he demonstrated that the cell, as distinguished from fibres, tubes, and intercellular substances, is the sole and fundamental element in plant structure; advanced the theory that secondary thickening of cell walls comes from within; developed with great clearness the idea of the chemical nature of the cell wall; showed the nature of intercellular substances; and classified tissues for comparison in different groups of plants. In cytology he showed that chloroplasts consist of protoplasm, and gave the name "protoplasm" to the "primordial utricle," explaining its rôle in cell division. In physiology he discovered the influence of contact on the movements of tendrils. He published 90 monographs, each of which represented a distinct contribution to botany, mostly in the fields of anatomy and histology. Perhaps his three most notable publications were *Vermischte Schriften botanischen Inhalts* (1845), a collection on various subjects, containing also a considerable number of his most important monographs; *Mikrographie* (1846); *Grundzüge der Anatomie und Physiologie der vegetabilischen Zelle* (1851). Von Mohl also established, in 1843, the *Botanische Zeitung*, which has continued to be one of the most influential of botanical journals. He remained its editor until his death in 1872.

MOHL, JULIUS VON (1800-76). A German Orientalist, brother of Hugo and Robert von Mohl. He was born at Stuttgart, Oct. 28, 1800; studied Persian and Chinese at Tübingen, Paris, London, and Oxford; was professor of Oriental literature in Tübingen (1826-32); went to Paris and became professor of Persian at the Collège de France in 1847 and in 1852 inspector of the Oriental department of the national printing office. He died at Paris, Jan. 3, 1876. His

principal work is his edition of Firdausi's *Shāh Nāmāh* (6 vols., 1838-66), of which he also made a complete French translation, published after his death, *Le livre des rois traduit et commenté* (1876-78). His reports to the Société Asiatique were collected after his death and published under the title *Vingt-sept ans d'histoire des études orientales* (2 vols., 1879-80). His *Lettres de M. Botta sur les découvertes à Khorsabad* (1845) relate to the excavations at Nineveh. His wife, who was Miss Mary Clarke (1793-1883), maintained for many years a salon frequented by the wits and scholars of her time. She was the author of a work on *Madame Récamier* (London, 1862). Consult Simpson, *Letters and Recollections of Julius and Mary Mohl* (London, 1887).

MOHL, ROBERT VON (1799-1875). A German jurist and statesman, brother of Hugo and Julius von Mohl. He was born in Stuttgart, studied law at Heidelberg, Göttingen, and Tübingen, and in 1824, after publishing *Das Bundesstaatsrecht der Vereinigten Staaten von Nord-Amerika*, was made a professor of public law at Tübingen. In 1836 he was made head librarian of the university. But his attack on the political régime in 1845 forced him from his chair and from the government employ. Almost immediately afterward he was elected to the Lower Chamber of Württemberg, became professor at Heidelberg (1847), and was a member of the Vorparlament and of the National Assembly at Frankfurt. After acting for seven months as Minister of Justice in the Imperial ministry set up by the Frankfort Parliament he returned to his professorial duties in Heidelberg (1849), and from 1857 represented the university in the First Chamber of Baden. From 1861 to 1866 he was representative of Baden at the German Bund at Frankfort, and during 1867-71 he was Envoy at Munich. In 1871 he was appointed president of the financial chamber of Baden. A year before Mohl's death he was elected to the German Reichstag from Baden. Among his writings are: *Staatsrecht des Königreichs Württemberg* (2d ed., 1840); *Die deutsche Polizeiwissenschaft nach den Grundsätzen des Rechtsstaats* (1832-34; 3d ed., 1866); *Encyklopädie der Staatswissenschaften* (1859; 3d ed., 1887); *Das deutsche Reichsstaatsrecht* (1873).

MÖHLER, mē'lēr, JOHANN ADAM (1796-1838). One of the most distinguished modern polemical divines of the Roman Catholic church. He was born at Igersheim in Württemberg, May 6, 1796. He received his education at the Gymnasium of Mergentheim, the lyceum of Ellwangen, and the University of Tübingen. He received priest's orders in 1819 and for a short time was employed in missionary duty. In 1823 he began to lecture on canon law and Church history at Tübingen and in 1826 became professor extraordinary, in 1828 professor ordinary, of theology. His earliest publication was *Die Einheit in der Kirche oder das Prinzip des Katholizismus* (1825), which was followed in 1827 by a historico-theological essay *Athanasius und die Kirche seiner Zeit*. His reputation rests mainly on his *Symbolik* (1832; Eng. trans., London, 1843, reprinted, 1894). This work led to a controversy with his Protestant colleague in the university, F. C. Baur (q.v.), and Möhler's two replies were important for Catholic theology (late editions, Ratisbon, 1900, Mainz, 1906). In 1835 Möhler removed to the Univer-

sity of Munich. His first appointment was nominally the chair of biblical exegesis, but he really devoted himself to the department of Church history, in which his opening course was eminently successful. He died in Würzburg, April 12, 1838. His miscellaneous works were collected and published posthumously in two volumes (Regensburg, 1839-40) by his friend Dr. Döllinger; his lectures on Church history by Gams (ib., 1867-70). Consult his biography by Wörner (Regensburg, 1866) and by Friedrich (Munich, 1894).

MOHLER, mō'lēr, JOHN FREDERICK (1864-). An American physicist, born at Boiling Springs, Pa. He graduated at Dickinson College in 1887 and at Johns Hopkins University (Ph.D.) in 1897. After teaching mathematics in academies at Dover, Del., and at Wilbraham, Mass., from 1887 to 1894, he became (1896) professor of physics at Dickinson. His researches include investigations on the surface tension of water below 0° C. He assisted in the discovery that the pressure surrounding the electric arc changes the wave length of the light emitted, and discovered the relation of the shift of spectral lines to the atomic volume, as well as a peculiarity in the light spectrum of magnesium. He also measured the pressure in the electric-light spark. His publications include *A Manual of Practical Physics* (1897-1903) and numerous articles in scientific journals.

MOHN, mōn, HENRIK (1835-). A Norwegian meteorologist, born at Bergen and educated at Christiania. In 1860 he won the King's gold medal and obtained a government scholarship in astronomy, in 1861 became connected with the astronomical observatory, and in 1866 director of and professor in the meteorological institute of Christiania University. Mohn represented Norway in many international congresses of meteorology and was a member of the Polar Commission which organized magnetic and meteorological stations (1882 et seq.). His writings include: *Les orages dans la péninsule scandinave* (1888), with Hildebrandson; a very valuable *Grundzüge der Meteorologie* (1875; 5th ed., 1898; trans. into Italian, Spanish, French, Russian, Polish, and Flemish); *The North Ocean, its Depths, Temperature, and Circulation* (1887); two large works: *The Norwegian North Polar Expedition, 1893-96*, vol. vi, *Meteorology* (1905); *Meteorology: Report of the Second Norwegian Arctic Expedition in the "Fram," 1898-1902* (1907).

MO'HO. A tropical tree. See HIBISCUS.

MOHO. A honey sucker of the Sandwich Islands whose native name has become the designation of a local genus of the family Meliphagidæ, which contains two species, the yellow-tufted moho or o-o or uho (*Moho nobilis*) and another (*Moho apicalis*). They are handsome, long-tailed, blackish birds with bright yellow tufts of feathers on each side of the wings and some white tail feathers. After the disappearance of the mamo (q.v.) the feathers of the moho were used for making the ceremonial robes and ornaments of Hawaiian chiefs, until they were superseded by European clothes and insignia of rank. Early accounts of the islands record that this bird, which frequented the mountains and forests and had much the appearance and habits of a North American oriole, was captured by means of birdlime. Its yellow feathers having been plucked out, it was then freed, in hope that it would furnish an-

other supply the next year. These feathers, from which also a beautiful head-dress (for women) called leis was made, were received by the King as a poll tax; yet it took many years to collect enough for a mantle, the price of which, estimating the time and labor at modern standards, would probably exceed a million dollars. A few examples of these feather cloaks are preserved in European museums. See Plate of CREEPERS.

MO'HOOKS. The name by which the members of the Mohock or Mohawk Club of London in 1711-12 were known. The object of the club was mischief. With the Restoration it had become a favorite amusement of dissolute young gentlemen to swagger at night about the town, breaking windows, upsetting sedans, beating quiet men, and offering rude caresses to pretty women. The Mohocks, who formed one of the ruffian clubs of the time, made a specialty of slitting men's noses, beating people, and rolling women in hogsheads down Snow Hill. Prince Eugene of Savoy was charged by a Jesuit spy with having suggested that they should assassinate the Earl of Oxford. A royal proclamation dissolved the club after about a year's existence. Consult Jonathan Swift, *Journal to Stella* (new ed., New York, 1904).

MOHONK' LAKE. A summer settlement in Ulster Co., New York, 14 miles northwest of Poughkeepsie and 5½ miles from New Paltz, from which it is reached by stage. In the Shawangunk Mountains, it is situated on the north end of Lake Mohonk, which is fed by underground springs, at an elevation of about 1200 feet near the summit of "Sky Top," and is surrounded by mountain scenery of distinctive beauty. The settlement is the work of Albert Keith Smiley (q.v.), who purchased a large tract of land here in 1860 and in 1870 built a large hotel. The estate is beautifully laid out and consists of a tract of land of about 5500 acres. It is chiefly noted as the home of the Lake Mohonk Conference (q.v.).

MOHOS. See MOXOS.

MOHR (Ar. *muhr*, colt, from *mahara*, to be adroit). A West African gazelle (*Gazella mohr*), called the swift, and among the largest of its group, which is much hunted by the Arabs of Senegal because its stomach often contains the bezoars called mohr's eggs, so highly valued in Morocco and the western Sahara for their supposed medicinal properties. See BEZOAR.

MOHR, CHARLES THEODOR (1824-1901). An American botanist and forester. He was born at Esslingen in Württemberg, studied at the Stuttgart Polytechnic, and with Kappler explored Dutch Guiana in 1845. He went to California on the discovery of gold in 1849 and, after four years as a druggist in Louisville, Ky., removed to Mobile, Ala., in 1857. He was a member of the committee on revision of the United States Pharmacopœia in 1890, and in 1892 gave himself up to forestry and botany. He had been appointed botanist of the Alabama Geological Survey in 1884 and agent of the Forestry Division of the United States Department of Agriculture in 1889. He contributed to Berney's *Handbook of Alabama* and wrote *The Timber Pines of the Southern United States* (1896-97) and *Plant Life of Alabama* (1901).

MOHR, KARL FRIEDRICH (1806-79). A German chemist, born at Coblenz. He was educated at Heidelberg, Berlin, and Bonn, and then entered his father's apothecary business, to

which he succeeded in 1840. He retired from business in 1857, and after financial losses became a lecturer in 1864 and professor of pharmacy in 1867 at Bonn. Before his death Mohr had become the best-known pharmaceutical chemist in Germany. His publications include: *Pharmacopœia Universalis* (2 vols., 1845); *Lehrbuch der pharmaceutischen Technik* (1847; 3d ed., 1866); a famous *Lehrbuch der chemisch-analytischen Titrimethode* (2 vols., 1855-59; 7th ed., 1896); *Geschichte der Erde* (1866; 2d ed., 1875).

MOHSITE. See ILMENITE.

MO'HUN, MICHAEL (1625-84). A noted English actor of the period following the Restoration. He had been a soldier both in the Civil War and afterward in Flanders, where he got the title of major, by which he was known. He was a member of the company in the early days at Drury Lane, then the Theatre Royal, and created rôles in several of the plays of Dryden and of Lee. King Charles II, for whose father he had fought, regarded him highly. He died in London in October, 1684. Consult: Geneste, *History of the English Stage* (Bath, 1832); Doran, *Annals of the Stage* (ed. Lowe, London, 1888); Downes, *Roscius Anglicanus* (reprinted, ib., 1886).

MOIDORE, moi'dôr (Portug. *moeda d'our*, money of gold). A former gold coin of Portugal, of the value of 4800 reis, equivalent to 2ls. 2d. or nearly \$5.18. It was also called lisbonine.

MOIGNO, mwä'nyô', FRANÇOIS NAPOLÉON MARIE (1804-84). A French mathematician, born at Guéméné in Morbihan. He entered the Society of Jesus in 1822 and devoted himself to the study of mathematics and physics. During the revolution of 1830 he sought refuge with others of his order in Switzerland. In 1836 he became professor of mathematics at the preparatory school of Sainte-Geneviève in Paris. He resigned from his order in 1843 and became connected with various journals, of which he founded *Cosmos* (1852) and *Les Mondes* (1862). In 1873 he was appointed one of the canons of the chapter of Saint-Denis. Among his works are: *Lçons de calcul différentiel et de calcul intégral* (1840-61); *Répertoire d'optique moderne* (1847-50); *Saccharimétrie* (1869); *Les splendeurs de la foi* (1879-83); *Les livres saints et la science* (1884).

MOIR, DAVID MACBETH (1798-1851). A Scottish physician and author, born at Musselburgh, a small seaport near Edinburgh. He studied medicine and practiced in his native town. Moir became widely known by his essays and poems contributed to *Blackwood's Magazine* under the signature Δ (delta). He died July 6, 1851. Moir's most interesting production is a Scottish novel entitled *The Autobiography of Mansie Wauch* (1828; new ed., 1895). Consult also *Poetical Works*, edited with memoir by Aird (Edinburgh, 1852).

MOI'RA, second EARL OF. An English general and administrator in India. See HASTINGS, FRANCIS RAWDON-HASTINGS, MARQUIS OF.

MOIRE, mwär (Fr., mohair). A silk figured by the peculiar process called watering. The silks for this purpose are moistened and then folded from one end to the other in triangular folds. After being thus reduced to a comparatively small length they are submitted to heavy pressure, generally in a hydraulic press. After being removed from the press the fabric is

found to be covered with wavy lines. As only one side is to be waved, the fabric is made up for the press with a pasteboard above each second fold. The silk is next hot-pressed, and the side next to the pasteboard comes out glazed, while the other remains watered. The finest kinds of watered silks are known as moires antiques. The same process has been applied to woolen fabrics called moreen.

MOIS, mō'ez (an Annamese term corresponding to the Cambodian *Peunong*, Loatian *Kha*, Tonkinese *Myong*, *Muong*, etc.). An extensive group of so-called savage tribes dispersed over the table-lands and mountains between the Mekong and the Annamese coast, from the frontiers of Yunnan to Cochinchina. They have been regarded as one of the older groups of Farther Indian aborigines. In spite of the multitude of tribes into which the Moïs are divided they exhibit a remarkable uniformity in physical type and manners. In physical type they are rather short, dolichocephalic, straight-eyed, somewhat wavy-haired, with reddish dirty-white skin. The Moïs are as a rule of peaceful disposition, being hunters and husbandmen of a primitive sort. In the Moïs a sub-Caucasic (white) physical trait has been detected, and others ally them, by reason of their manners and customs and implements, with the Malayan peoples. Consult Dourisboue, *Les sauvages Ba-Hnars* (Paris, 1873), and Billet, *Deux ans dans le Haut-Tonkin*, etc. (ib., 1896). See INDO-CHINESE.

MOISSAC, mwā'sāk'. A town in the Department of Tarn-et-Garonne, France, on the river Tarn, 17 miles west-northwest of Montauban (Map: France, S., F 4). The church of St. Pierre, dating from the year 1100, has a portal with very unusual carving. There are also an abbot's palace, a communal college, a library, and a museum. Moissac has a good trade in flour, grain, oil, wine, poultry, and fruit. Pop., 1901, 8407; 1911, 8137.

MOISSAN, mwā'sān', HENRI (1852-1907). A French chemist, born in Paris. He studied at the Museum of Natural History; became connected with the School of Pharmacy (1879), its professor of toxicology (1886) and of mineral chemistry (1889). In 1900 he was appointed professor at the Sorbonne. He won the Lacaze prize in 1887 for his valuable experiments with fluorine, which he was the first to isolate and to liquefy. Considerable notoriety attended his announcement, in 1893, that he had succeeded in producing artificial diamonds by suddenly chilling a molten mass of iron containing dissolved carbon. More practical was his simplification of the production of acetylene gas and his inorganic syntheses by the use of the electric furnace. In 1906 he was awarded the Nobel prize for chemistry. Moissan contributed articles on chromium, manganese, and iron to Frémy's *Encyclopédie chimique*; wrote: *L'isolement du fluor* (1886); *Reproduction du diamant* (1893); *Carbure de calcium* (1894); *Etude complète des carbonés amorphes et des graphites* (1898); *Classification des éléments* (1904); and edited an excellent *Traité de chimie minérale* (1905).

MOISTURE. See HUMIDITY.

MOIVRE, mwā'vr', ABRAHAM DE. A French-English mathematician. See DE MOIVRE.

MOJARRA, mō-hār'rā (Portug. name). Any of many carnivorous sea fishes of moderate or small size, allied to the porgies (Sparidae),

and constituting the tropical family Gerridae. Some of them are well known and of some importance as market fishes. The small silvery Pacific coast species of the genus *Eucinostomus* are called mojarritas. The mojarra blanca, or broad shad (*Xystema cinereum*), is a favorite food fish on both coasts of Central America and in Cuba. Another species of that region (*Gerres olisthostomus*) is called Irish pompano and mutton fish by fishermen. The term is applied, by the aid of a discriminative adjective, to various outside fishes, e.g., the cow-pilot.

MOJI, mō'jē. A town of Japan situated at the north extremity of the island of Kiushiu, on the Strait of Shimonoseki and opposite the city of that name (Map: Japan, B 7). It has grown rapidly to an important place since 1891, when it became the terminus of the Kiushiu Railroad. The extensive coal deposits in the neighborhood also add to its importance. The Moji side of the channel, which is here 1 mile wide, is more convenient as a landing place for steamers than the port of Shimonoseki. The imports and exports at Moji in 1913 were valued at \$19,687,969 and \$10,406,112, respectively. Pop., 1903, 38,065; 1908, 55,682.

MOJOS. See MOXOS.

MOJSISOVICS, moi'sē-sō'vich, EDMUND VON (1839-1907). An Austrian geologist and student of the Alps. He was born and educated at Vienna; founded the Austrian Alpine Society—the first of the kind in Europe—in 1862, and in 1869 a like association in Germany, which joined the Austrian society in 1873. In the Imperial Geological Institute he became chief geologist in 1870 and assistant director in 1892. He retired in 1901. His more important works include: *Das Gebirge um Hallstatt* (1873-76); *Die Dolomitriffe von Südtirol und Venetien* (1878-80); *Die Cephalopoden der mediterranen Triasprovinz* (1882); *Arktische Triasfaunen* (1886); *Die Cephalopoden der Hallstätter Kalke* (1873-1903); *Die Cephalopoden der oberen Trias des Himalaya* (1896).

MOKANNA, mō-kān'nā, AL. See HAKIM IBN ALLAH; MOHAMMEDAN SECTS.

MOKI, mō'kē. A Pueblo tribe of Arizona. See HOPÍ.

MOLA DI BARI, mō'lā dē bār'rē. A city in the Province of Bari delle Puglie, Italy, on the Adriatic Sea, 12 miles southeast of Bari (Map: Italy, F 4). The exports consist of oil, live stock, leather, and wine. Pop. (commune), 1901, 13,962; 1911, 14,911.

MOLA DI GAETA, dē gā-ā'tā. The old name of Formia (q.v.), a seaport in south Italy.

MOLALA, mō-lā'lā. See WAILATPUAN.

MOLA'RIA. A genus of arthropods, found fossil in the Stephen formation, of Middle Cambrian age, in British Columbia. It consists of a semicircular cephalic shield without any trace of eyes, a trilobed dorsal test, and a long slender telson. It is supposed to belong to the Arachnida and is placed in the family Aglaspidæ. Other similar forms are Habelia and Emeraldella. See MEROSTOMATA; STEPHEN FORMATION.

MOLAR WEIGHT. See MOLECULES.

MOLASSE, mō-lās' (Fr. fem. of *mol*, from Lat. *mollis*, soft). An extensive middle Tertiary deposit occupying the central lake region of Switzerland between the Alps and the Jura. It consists chiefly of sandstone, marls, and lime-stones, but at the foot of the Alps it usually

takes the form of a conglomerate called Nagel flue, which is said to attain the astonishing thickness of from 6000 to 8000 feet in some localities. The molasse includes the Oeningen group of strata, which is remarkable for its fossil insects and plants.

MOLASSES. See SUGAR.

MOLAY, mō'lā', JACQUES DE (c.1243-1314). The last Grand Master of the Templars. He was a native of Burgundy, and entered the Order of Templars in 1265, and was elected Grand Master in 1297. About this time Philip IV of France (1285-1314) undertook to carry out the project which he had formed to destroy the order, chiefly because the French monarchy was in sore financial straits and the Templars were wealthy. There was at this time constant talk of a new crusade, and Clement V called the Grand Master of the Templars to Europe. The call was answered by Molay, who appeared in France in the fall of 1306, accompanied by a chosen band of distinguished knights of the order. He repaired to Poitiers in 1307 to render his allegiance to the Pope, and was there informed of serious charges against the order. He went away believing that he had cleared the order and remained in high honor with the King. But the latter was working secretly through the officers of the Inquisition in France and procured the arrest of every Templar in France on Oct. 13, 1307; Jacques de Molay was seized in the house of the Temple and taken before special commissioners of the Inquisition. Although the Pope was indignant at this action on the part of Philip, and suspended the powers of the Inquisition in France, the King finally induced him to take part in the action. Molay was examined repeatedly by papal commissions, confessed the truth of some of the charges, and finally on March 18, 1314, he was condemned to perpetual imprisonment. He, however, immediately retracted all he had said, and thereupon was burnt the same evening, protesting the innocence of the order. Consult: F. Gmelin, *Schuld oder Unschuld des Tempelordens* (Stuttgart, 1893); Ernest Lavisse, *Histoire de France*, vol. iv, part ii (Paris, 1901); H. C. Lea, *History of the Inquisition of the Middle Ages*, vol. iii (new ed., New York, 1906). See **TEMPLARS, KNIGHTS**.

MOLBECH, mōl'bék, CHRISTIAN (1783-1857). A Danish philologist and historian, born at Sorø. He had a position in the Royal Library at Copenhagen and was professor of literature in the university of that city from 1829 to 1843, being simultaneously codirector of the Royal Theatre. He wrote several works, critical, poetical, historical, and philological, the most important of which is a Danish dictionary (2 vols., 1828-33; 2d ed., 1854-59), the first of real value ever compiled. He also wrote a Danish dialect lexicon (1833-41) and a Danish glossary (1853-66). His other works include: *Dansk Haand-Ordbog til Retskrivnings og Sprogriktigheds Fremme* (1813) and editions of *Den danske Rimekrønike* (1825); *Henrik Harpestrengs Lægebog* (1826); *Den ældste danske Bibel-Oversettelse . . .* (1828).

MOLBECH, CHRISTIAN KNUD FREDERIK (1821-88). A Danish poet and critic, born at Copenhagen, the son of Christian Molbech. He was professor of Scandinavian literature at the University of Kiel for 11 years (1853-64) and wrote several romantic dramas, such as *Klin-tekongens Brud* (1845), *Dante* (1842), *Venus-*

bjerget (1845), and *Ambrosius* (1878; 15th ed., 1909; Eng., Fr., Ger. trans.), and published collections of poems, such as *Billeder fra Jesu Liv* (1840), *Lyriske Digte og Romancer* (1863), *Dæmring* (1851; 3d ed., 1856), and *Efterladte Digte* (1888). As critic and theatrical censor Molbech was in touch with stage matters, and much of his work in this line is of interest. The most valuable contribution he made to the literature of his country was an excellent translation of Dante, *Den guddommelige Komedie* (4 vols., 1851-63; 4th ed., 1909).

MOLD (AS. *molde*, Goth. *mulda*, OHG. *molta*, dialectic Ger. *Molt*, dust, connected with Goth., OHG. *malan*, Ger. *mahlen*, Ir. *melim*, Lith. *malti*, Lat. *molere*, to grind). A term applied to various saprophytic fungi, but chiefly used in connection with the black molds (Mucorales). These molds are common on organic material, such as stale bread (kept moist and warm), fruits, fruit juices, etc., and possess a characteristic cobwebby, fleecy, white mycelium (q.v.), composed of large, often glistening and profusely branching hyphae (see **HYPHA**). The common bread mold is *Rhizopus nigricans*, so named because the spores and sporangium stalk are dark, or often black, a fact which also suggests the common name, black mold. The ordinary mold on manure is *Mucor mucedo*. Recent investigations of the black molds have shown that the mycelia are sexually differentiated, so that two different strains must be brought together before the sex act occurs or even before the sex organs are formed. The term "mold" is also applied frequently to the so-called herbarium mold (*Aspergillus*), which occurs also on bread, preserves, etc., and to the blue mold (*Penicillium*) on bread, etc. These forms are usually differentiated from the black molds by being called blue and green molds. For black molds, see **PHYCOMYCETES**; and for blue and green molds, see **ASCOMYCETES**.

MOLDAU, mōl'dou (Bohem. *Vitava*). The chief river of Bohemia and an important tributary of the Elbe (Map: Austria, D 2). It rises in the Böhmerwald, on the southwest frontier, at an elevation of 3800 feet above the sea, and flows first southeast, then northward past the city of Prague, and enters the Elbe opposite Melnik, after a course of 265 miles. It becomes navigable at Budweis, and by means of canalization vessels of 700 to 800 tons can reach Prague at any season.

MOLDAVIA. A former principality in southeastern Europe, now forming, together with Wallachia (q.v.) and the Dobrudja (q.v.), the Kingdom of Rumania (Map: Balkan Peninsula, F 1). It is bounded on the north and east by the Pruth, which separates it from Russia, on the south by Wallachia, and on the west by Transylvania. Area, 14,759 square miles. Pop., 1899, 1,832,106; 1912, 2,145,464. The chief town is Jassy, the capital of the principality. For further description, see **RUMANIA**.

History. The Principality of Moldavia was founded about the middle of the fourteenth century by the Wallach Voivode Bogdan. Its cradle appears to have been in the northeastern Carpathians, near the sources of the Theiss. It soon grew to be a large state, embracing, in addition to the present Moldavia, Bukovina and Bessarabia. The dominion over this region was coveted by the kings of Poland and Hungary, and the Moldavian princes leaned now on the one power and now on the other, neither being able

permanently to assert its overlordship. Prince Stephen the Great was a powerful ruler (1457-1504). He defeated the armies of the great Sultan Mohammed II, winning a signal victory over the Turks at Rakova in 1475. His successors, however, were unable to withstand the growing power of the Moslems, and early in the sixteenth century Moldavia became tributary to the Porte. The Turks proceeded to build fortresses in the Moldavian territory, and their hold on the country was gradually tightened, although Moldavia remained without the sphere of Turkish settlement. From the early part of the eighteenth century down to the outbreak of the Greek revolution in 1821, which began with Ypsilanti's brave deed at Jassi, Moldavia, as well as Wallachia, was governed by hospodars appointed by the Sultan from the aristocratic Greek families, known as Fanariots. The designs of Russia in the direction of dominion in the regions held in subjection by the Turks—designs which she sought to advance by claiming a protectorate over the Greek Christians in the Turkish dominions—violently affected the fortunes of Moldavia, which lay in the path of the Russian armies and was repeatedly subjected to Russian occupation. In 1812 Bessarabia was ceded by Turkey to Russia, Bukovina having been annexed to Austria in 1777. After 1821 native princes were once more at the head of the government. The protectorate accorded to Russia by Turkey in the Treaty of Adrianople (1829), which threatened to make Moldavia and Wallachia mere dependencies of Russia, was terminated by the Crimean War and the Treaty of Paris (1856). In 1859-61 Moldavia and Wallachia were united into the Principality of Rumania. In March, 1907, there was a peasant uprising, resulting in many deaths and great loss of property. See RUMANIA.

MOLDING. See **FOUNDING**.

MOLDING (from mold, OF. *moller*, *moler*, Fr. *mouler*, Sp., Portug. *moldar*, to measure, from Lat. *modulare*, to measure, from *modulus*, dim. of *modus*, measure, melody, manner, mode). A decorative strip or edging projecting or receding from the general surface adjoining it and having the same section or profile from end to end, the profile being usually composed chiefly or wholly of curves. Moldings are employed to frame pictures and panels, to decorate the edges of arches and openings, to form belts, bands, and cornices, and to emphasize all manner of architectural features, by the narrow lines or strips of modulated light and shade which they produce. Classic moldings generally project, Romanesque and Gothic moldings generally recede, from the general surface. Moldings may be plain or they may be carved with repeated ornament motives. In the classic styles there are eight typical moldings: the *fillet* and *bead* or *astragal*, very narrow projecting moldings, square and half-round respectively; the *cavetto* and *ovolo*, quarter-round moldings, respectively concave and convex; the *scotia*, half-elliptical concave, and *torus*, half-round convex; the *cyma recta* and *cyma reversa*, each composed of a quarter-round convex and quarter-round concave profile. The *cyma* or *ovolo* or group of moldings at the bottom of a cornice is called the *bed mold*; the *cyma* above the corona is the *cymatium*; the fillet at the top of the architrave is the *tania*. In Romanesque and Gothic architecture the variety of moldings is greater, the hollows are deeper, the convex moldings bolder,

and it is by the multiplying of rolls or *boutels*, hollows, oblique fillets and other profiles that much of the splendid decorative effect of Gothic interiors is produced, especially in English architecture. *Enriched* moldings are those which are carved with repeated ornaments—the bead-and-reel, egg-and-dart, water-leaf, acanthus, and anthemion in classic art; the zigzag, billet, dog-tooth, and beakhead in Romanesque art; the ball-flower, crocket, and leaves and vines of all sorts in Gothic art. While in the classic styles the convex moldings are the ones most generally carved, in Gothic art the chief adornments are in the hollows, in which the flowers or vines produce spots of light against the shadow. The Oriental styles make little account of moldings. Egyptian architecture knew only the bundle torus; in Assyrian and in Moslem design moldings hardly appear.

In carpentry and cabinetwork moldings are of the first importance and of great variety, with

FORMS OF MOLDING IN CARPENTRY.

special names for each—ogee, cove, thumb mold, plowed bead, bolection, etc. A picture molding is a horizontal strip of molding on a wall, from which pictures may be hung. The treatment of moldings constitutes one of the distinguishing marks of styles in architecture and decoration. See special articles on the different forms of molding above enumerated; also **ORDERS OF ARCHITECTURE**.

MOLDING SAND. Under this term are included siliceous sandy materials employed for making either molds or cores for use in casting iron, steel, bronze, brass, etc. The materials used vary in character from a loamy clay to a sand or even a gravel, often but not always of highly siliceous character, the grade of the material employed depending on the size or character of the casting, the kind of metal, or the portion of the mold in which the sand is to be used. Smaller castings and those with a smooth surface call for a fine sand, while large castings and cores used to fill the hollow spaces of the castings call for coarser material. One or more grades of sand may be mixed together, and the blending of molding sands is now quite extensively practiced both at the pit and foundry. But even so, certain foreign substances, as flour, oil, molasses, etc., may sometimes have to be added to increase the sand's bonding power. A molding sand should be strong enough to hold its shape in use, resistant to heat, and porous enough to permit the escape of gases but not admit the molten metal. Its value, then, depends on its physical properties, which are not indi-

cated by a chemical analysis but have to be determined by laboratory and foundry tests. Molding sands for ordinary work are obtainable at many places, but the better grades for finer work are less common and are obtained chiefly from the upper Hudson valley in New York and from the localities of Conneaut, Ohio, Newport, Ky., and Valparaiso, Ind. Consult: Kummel and Parmelee, in New Jersey Geological Survey, *Annual Report* (Trenton, 1904); Ries and Rosen, in Michigan Geological Survey, *Annual Report* (Lansing, 1907); Heinrich Ries, *Economic Geology* (3d ed., New York, 1910); also *Proceedings of the Foundrymen's Association* (Cleveland).

MOLE (abbreviation of *molewarp*, *moldwarp*, *mouldwarp*, OHG. *moltwerf*, *multwerf*, Ger. *Maulwurf*, from AS. *molde*, dust + *weorpan*, Goth. *wairpan*, OHG. *werfan*, Ger. *werfen*, to throw). A small mammal belonging to the order Insectivora and to the family Talpidae, although the name is often applied to other nearly related forms. It is a small animal, generally less than 8 inches in length, thickset, with short stout limbs, the anterior pair powerful and especially adapted for digging. The fur is dense and soft, lying backward or forward with equal ease; the tail is short; and the eyes are very small. In many species the eyes are covered over by a membrane, and recent investigations on the common American mole show that the eye itself is much degenerated and probably is of practically no use as an organ of sight. Moles are subterranean in their habits and more or less nocturnal. They are very voracious and eat animal food exclusively. The earthworm is the principal article in their diet, but all other worms, grubs, caterpillars, and insects are readily eaten, and in captivity raw meat, small birds and mammals, and even other moles, will be seized and eaten greedily. Although the limbs are short, moles are capable of very rapid movements. When in pursuit of earthworms moles often travel long distances underground, and frequently so near the surface that the earth becomes raised up above the tunnel which they make. Moles are therefore constantly hunted and trapped by gardeners. The favorite method of capture is by means of a trap set in one of these underground galleries. The simplest form of trap is a wire noose so arranged on a spring that when the mole enters it the spring is released and the wire is drawn taut.

Moies build very remarkable nests, or homes, consisting of two circular galleries, the smaller above the larger, and connected with it by five straight passages; at the centre is a chamber connecting with the upper gallery, while from the lower gallery horizontal passages run out in all directions. From these horizontal passages are given off the various subsurface tunnels made when the mole is in search of food. The central chamber and circular galleries are built in a mound of earth, more or less elevated above the surface, and larger than the ordinary heaps of earth, or molehills, thrown up by these animals. From the central chamber there is also a vertical tunnel leading downward and then bending upward again to join one of the horizontal galleries. The young are brought forth not in the central chamber, but in a special chamber formed where two or three horizontal galleries meet, which is lined with leaves and other warm materials. Four or five young ones are usually produced at a birth, and some writers state that a second brood is produced late in the summer.

Moies take to water readily and swim well, so that they are able to cross considerable lakes and streams.

The anatomy of moies is interesting because it is so modified as to adapt the animal admirably to its manner of life. The fore limbs are attached to the skeleton so far forward that they lie beside the neck and thus add but little to the general width, yet remain sufficiently long to reach earth ahead of the nose. The hind limbs are also so arranged as not to occupy unnecessary space, the hip joints being closely approximated to the axis of the body. The humerus is very short and of a peculiar shape, and the carpals are very wide. On the inner (radial) side of the hand is a large sickle-shaped bone, regarded by some as a prepollex. The teeth vary in number from 36 to 44, in different genera. The Old World moies have 42 or 44 teeth, and the first and second upper incisors are of about the same size, while the moies of America have 36 or 44 teeth, and the first upper incisor is much larger than the second.

The common mole of Europe (*Talpa europaea*) is very widely distributed, ranging from England to Japan and from the Altai to the Himalaya mountains. The eyes in this species are not covered by a membrane, as they are in the rest of the genus. The habits of the European mole have been carefully studied, and the remarks made above in regard to the burrows and nests of moies refer especially to that species. Seven other species of *Talpa* are known, chiefly Asiatic, but only two occur south of the Himalayas. Moies are absent from Africa and Australasia. Two peculiar moies occur in Tibet, one of which is placed in a distinct genus, as it has a somewhat narrower hand and only 42 teeth.

DENTITION OF THE MOLE.

The American moies belong to the genera *Scalops*, or *Scalopus*, having 36 teeth, webbed hind feet, and a narrow, slender muzzle; *Scapanus*, with 44 teeth and a narrow, tapering muzzle; *Parascalops* and *Condylura*, with 44 teeth and a remarkable snoutlike muzzle, fringed with a circle of about 20 slender, soft, cartilaginous processes. This last genus contains only a single species, the well-known star-nosed mole (*Condylura cristata*), which is not uncommon throughout the northern United States. Its very curious snout is somewhat piglike, but the fringing processes give it a unique appearance. In habits this species closely resembles the more ordinary moies. The common mole of the eastern United States (*Scalopus aquaticus*) is a rather shrewlike animal, partial to the banks of streams. No moies occur south of the United States.

The name mole is often given to other insectivorous burrowing mammals, as the mole shrew of northwestern America (*Neurotrichus gibbsii*), which in structure approaches the desman (q.v.) but in habits is somewhat like a mole. The golden moies (see GOLDEN MOLE) of South Africa belong to a different family, the Chrysochloridae, and are not closely related to the Talpidae, although in external appearance they are strikingly like them. There are seven or eight species in the single genus *Chrysochloris*. The

strange marsupial mole (q.v.) of southern Australia and the duck mole (i.e., the duckbill) are marsupials with more or less molelike appearance and habits.

Moles are found fossil throughout the Tertiary strata of Europe, a fact of great significance as showing how ancient must be the insectivorous type of mammals. The genus *Talpa* may be traced back even as far as the Lower Miocene, with its peculiarities of structure already well developed, while true members of the family Talpidae appeared at least as early as the Lutetian in the Middle Eocene.

MOLE, GOLDEN. See GOLDEN MOLE.

MOLÉ, mō'lā', LOUIS MATTHIEU, COUNT (1781-1855). A French statesman, born in Paris. He was a descendant of the famous French magistrate Matthieu Molé (1584-1656), prominent at the time of the Fronde (q.v.). His father, president of the Parliament of Paris, died by the guillotine in 1794. After spending his early life in exile he returned to France, and first attracted notice by his *Essais de morale et de politique* (1805), in which he vindicated the government of Napoleon on the ground of necessity. The attention of the Emperor was then drawn to him; he was appointed to various offices in succession, was raised to the dignity of a count, and became Minister of Justice (1813). After Napoleon's return from Elba he refused to subscribe to the declaration of the Council of State banishing the Bourbons forever from France, and declined a seat in the Chamber of Peers. In 1815 Louis XVIII made him a peer of France. In 1817 he was for a short time Minister of Marine, but afterward acted independently of party, and was one of the principal orators in the Chamber of Peers. In 1830 he became Minister of Foreign Affairs in Louis Philippe's first cabinet, but remained in office only a short time. From 1836 to 1839 he was Prime Minister as successor to Thiers. He also held the portfolio of Foreign Affairs. In 1840 he was chosen a member of the French Academy. From that time he took little part in political affairs, but after the revolution of 1848 exerted himself to rally and unite the party of order in the National Assembly, to which he had been elected. After the coup d'état he retired to private life.

MOLECH, mō'lek. The name or designation of a deity referred to in the Old Testament. It is generally recognized that the form Molech is an intentional distortion of *melek* by the substitution of the vowels of *bosheth* (shame). Most of the passages in which it occurs have reference to human sacrifice as forming a part of the cult of this deity, and particularly to child sacrifice or the sacrifice of the firstborn, referred to as "passing through the fire." (Lev. xviii. 21; 2 Kings xxiii. 10.) This phrase only implies that the victims were "given over" to the deity as a sacrifice, first slain and then burnt, as is evident from Ezek. xvi. 20 f., xxiii. 39; Jer. vii. 31, xix. 4 ff.; Deut. xii. 31; and other passages. At a later time, when all memory of the rite had passed away, the expression was explained by imaginary tales of children walking or leaping alive through the flames as an ordeal or of their being burned to death in the arms of an idol. There is no foundation for these stories. As to the god to whom these sacrifices were offered, scholars generally hold that Yahwe is meant. He is often designated as *ha-melek* (the king). (Isa. vi. 5; Jer. lxvi. 18, xlviii.

15; and elsewhere.) The testimony of Jeremiah (vii. 31) and of Ezekiel (xvi. 20 f., xxiii. 37 ff.) is sufficient to prove that the rite survived among the Jews to a comparatively late period, though very possibly it was only a last resort, in time of great distress, to avert disaster or placate an angry deity, as was the case among the Moabites (see MESHACH), and also that such offerings were made to Yahwe, since Jeremiah takes pains to deny that Yahwe had commanded them, and Ezekiel explains that Yahwe had indeed given them statutes that were not good, and defiled them by their sacrificial gifts in offering every firstborn, but only to fill them with horror. The law to which Ezekiel refers is clearly that of Ex. xiii. 12: "Thou shalt offer every firstborn to Yahwe." The anxious question of Mic. vi. 7: "Will Yahwe accept thousands of rams, ten thousand streams of oil? shall I give my firstborn for my transgression, the fruit of my body for the sin of my soul?" also shows how earnestly this sacrifice was contemplated as the supreme test of devotion to Yahwe. But the historian censures Ahaz for following the manner of the nations in performing the rite (2 Kings xvi. 4); it is forbidden in Deut. xviii. 10 and Lev. xviii. 21, xx. 2-6, and provision is made for the redemption of the firstborn. (See FIRSTBORN.) It has been supposed that the custom came into vogue in the days of Manasseh through Assyrian influence; but there is as yet no trace of it in Assyrian literature. Since it existed to a late time among the Carthaginians, it has been conjectured that it came into Judah from Phœnicia in the seventh century. It is probable, however, that it had existed sporadically from the earliest times among the Hebrews. While it manifestly was connected with the Yahwe cult, there is room for a question whether the Melek to whom the offering was made was always thought of as identical with Yahwe, or was not sometimes considered as a separate deity. As the Canaanites (including the Phœnicians) had their Milk and Melkart (cf. Abu Milki in the Tel el Amarna tablets and Milk Natan in later inscriptions), the Ammonites their Milcom (q.v.), and the Edomites their Malik (cf. Malik Ramu in an Assyrian text), so Israel and Judah may also have recognized a distinct Melek, of whose worship the child sacrifice was a prominent feature. The tone of some of the denunciations and legal prohibitions strongly suggests this. It is even possible that the commandment to offer the firstborn to Yahwe (Ex. xiii. 12, xxii. 29) was at first a protest against offering them to Melek or any other Baal, and the arrangement for redeeming them a later method of combating both the child sacrifice to Melek and its use in the worship of Yahwe in his capacity of melek, or king.

MOLE CRICKET. Any one of the crickets of the genus *Gryllotalpa* and its close allies, forming a tribe Gryllotalpides, remarkable for the dilated front legs, which superficially resemble those of the mole, and which are admirably adapted to an underground life. The en-

tire existence of the insect is subterranean. It travels in burrows of its own digging, and lays its eggs and rears its young in the same excavation. The adaptation of the front legs to the economy of the insect is very striking, as the tibiae and tarsi are so arranged as to act as shears with which rootlets are severed. Mole crickets are furnished with a curious auditory apparatus on the front leg below the knee, concealed in a deep fold of the surface. The male makes a sound which has been reduced to a scale by Scudder, and which differs from the songs of the other crickets. Sharp calls it a "dull, jarring note somewhat like that of the goatsucker." The mole cricket is principally carnivorous in its diet, although it feeds also to some extent upon vegetation, and the principal damage it does is in cutting roots which come in the way of its burrows. It is considered the most destructive insect to agriculture in Porto Rico, where it is called changa. The female lays from 200 to 400 eggs, and the young are at first gregarious, the mother watching over them and supplying them with food until their first molt; after this they disperse and begin to make burrows for themselves. These young are often devoured by the adult males. Consult David Sharp, "Insects," in *Cambridge Natural History*, vol. v (London, 1895), and O. W. Barrett, *The Changa, or the Mole Cricket* (Washington, 1903). See illustration under CRICKET.

MOLECULES—MOLECULAR WEIGHTS (Fr. *molécule*, from Neo-Lat. *molēcula*, dim. of Lat. *moles*, mass). It is now universally assumed by chemists and physicists that all bodies are made up of very small but finite material particles, the weight and composition of which determine the various properties of substances. These particles are called molecules. Each of these molecules is conceived to be formed by a group of elementary atoms, the sum of whose weights equals the weight of the molecule. When a substance is divided and subdivided by physical or mechanical means (e.g., by dissolving a small amount in a very large volume of some liquid and dividing the latter into small portions), its molecules become separated from one another without undergoing any change. When the substance is decomposed chemically, each molecule breaks up and its unity is destroyed. Atoms cannot be subdivided even by chemical changes of the substance containing them; and as up to the beginning of this century physical and chemical changes were the only types of change known and the only ones considered at all possible, atoms were assumed to be "incapable of subdivision by any means whatever." At present it may be considered as a definitely established fact that atoms undergo decomposition—true subdivision—during all radioactive processes. See ELECTRON; HELIUM; RADIUM.

The relative weights of molecules, termed molecular weights, are among the most important constants of nature, and their experimental determination presents no difficulty whatever. But it has been shown that even the absolute dimensions of molecules, their absolute weight, their actual number in a given volume of substance, their specific gravity, etc., can be ascertained with a high degree of probability. Brief mention may be made here of some of the simpler methods employed in searching for those absolute dimensions in the unseen world of molecules. Such theoretical researches are carried out mainly on the principle that when a hypothe-

sis is admitted within the scope of an exact science we must have exhaustive knowledge of the deductions that can possibly be made from it. Only by correlating the deductions with facts can we judge whether the hypothesis is reliable or not, and experience teaches that deductions seemingly incapable of experimental verification may ultimately not be so at all. Of course, the calculation of the absolute dimensions of molecules is also fascinating in itself. Like certain speculations in astronomy, it shows that there is no limit in the depth of the invisible and inaccessible beyond which scientific thought may not be expected to penetrate.

ABSOLUTE DIMENSIONS OF MOLECULES

The fundamental hypotheses of the kinetic theory of gases lead to the proposition that at any given temperature the volume of a gas is inversely proportional to its pressure. This relation, which had been known as a matter of fact long before it was established deductively, may also be expressed by saying that at any given temperature the product of the pressure and volume of a gas is constant:

$$pv = c.$$

From the point of view of the kinetic theory, v represents in this formula the empty space within which the molecules of the gas are free to move—i.e., the total volume filled by the gas minus the volume actually occupied by its molecules and minus a certain further fraction of the volume rendered unavailable by the disorderly motions of the molecules. As long as the gas is not too highly compressed, the total volume may be used in the above formula instead of the unknown intermolecular space. For, under low pressures, the difference between the volume of a gas and the volume of its empty intermolecular space is very slight, and hence the error committed amounts practically to nothing. But as the pressure exerted on the gas increases its volume becomes small, and the fraction of that volume rendered unavailable by the bulk of the molecules and by the irregularity of their motion becomes considerable. In other words, the difference between the volume filled by the gas and the available intermolecular space becomes too great to be neglected. At the same time, as the distance between the molecules becomes smaller they begin to exercise a certain amount of attraction upon one another; the result is that the tendency of the gas to expand and the pressure exerted by it upon the containing vessel are appreciably diminished. Under such circumstances the simple formula mentioned above ceases to express the relation between the observed pressure and volume of gases, and the following formula, first constructed by Van der Waals, has to be employed instead:

$$\left(p + \frac{a}{v^2}\right)(v - b) = c.$$

In this formula p denotes the pressure actually observed. To conform to the theoretical law, we add to p the quantity $\frac{a}{v^2}$ depending on the specific mutual attraction of the molecules and therefore also upon the volume occupied by the gas. The factor $(v - b)$ in the formula represents the total volume filled by the gas, diminished by four times the volume actually occupied by its molecules, which are assumed to be

MOLECULAR WEIGHTS

spherical. We thus obtain theoretically a set of ideal conditions, such as are in reality approached only when the volume occupied by the gas is very great. We have, namely, the ideal pressure—i.e., the pressure determined by the motion of the molecules and undiminished by their mutual attraction—and we have the actual volume within which the molecules are free to move; the product is evidently the same as in the case of the simpler law, $p v = c$, under low pressures.

The attraction of the molecules and their volume depend, of course, upon the nature of the gas. By actually determining the pressures and volumes of various gases, numbers may be substituted for c , p , and v in Van der Waals's formula, and thus equations may be obtained containing only two unknown quantities, a and b , the numerical values of which can then be easily computed. The following table shows the values of $\frac{1}{4} b$ (i.e., the fraction of the volume of a gas actually occupied by its molecules) for a few gases and vapors. These values are calculated for the temperature of freezing water (0° C.) and for normal atmospheric pressure:

SUBSTANCE	$\frac{1}{4} b$
Carbonic-acid gas.....	0.00050
Nitrous-oxide gas.....	0.00048
Sulphur-dioxide gas.....	0.00062
Ethylene gas.....	0.00056
Ethyl-chloride vapor.....	0.00097
Alcohol vapor.....	0.00093
Ether vapor.....	0.00144
Benzene vapor.....	0.00128
Carbon-disulphide vapor.....	0.00082

With the aid of these figures the specific gravity of the molecules, say of carbonic acid, may be readily calculated as follows: at 0° C. and under normal atmospheric pressure, 22,405 cubic centimeters of carbonic-acid gas weigh about 44 grams. The volume actually occupied by the molecules being $22,350 \times 0.00050$ cubic centimeters, one cubic centimeter entirely filled by carbonic-acid molecules, with no space between them, would evidently weigh

$$\frac{44}{22,350 \times 0.00050}$$

or about 4 grams; i.e., the specific gravity of a molecule of carbonic acid is about 4. Similarly, the specific gravities of the molecules of other substances are found to be as follows:

SUBSTANCE	Sp. gr. of molecules
Nitrous oxide.....	3.7
Sulphur dioxide.....	4.6
Ethylene.....	2.4
Ethyl chloride.....	2.9
Alcohol.....	2.2
Ether.....	2.3
Benzene.....	2.7
Carbon disulphide.....	4.3

Considerations of a somewhat more complicated nature lead to the conclusion that at 0° C., and under a pressure of 1 atmosphere, 1 cubic millimeter of any gas or vapor contains approximately 54,000,000,000,000,000 molecules. Since 1 cubic millimeter of hydrogen weighs 0.00009 milligram, the absolute weight of a single molecule of that gas is therefore

$$\frac{0.00009}{54,000,000,000,000,000}, \text{ which equals}$$

$$0.000,000,000,000,000,000,000,0166 \text{ milligram.}$$

In a similar manner the absolute weight of a molecule of any other gas or vapor may be readily calculated, by dividing the weight of one cubic millimeter by 54,000,000,000,000,000.

The practical value of the above results is, at least for the present, not nearly so great as that of the purely relative molecular weights constantly used in scientific work. For it is on our knowledge of these relative molecular weights that the modern theories concerning the structure and the mutual relations of chemical compounds, especially the numerous compounds of carbon, are based.

The principle underlying the determination of the relative molecular weights of gaseous or vaporized substances is Avogadro's rule (q.v.), according to which equal volumes of gases (under the same pressure and at the same temperature) contain equal numbers of molecules. Let a given volume of some gas weigh g_1 grams and let, under the same conditions, an equal volume of some second gas weigh g_2 grams. If the weight of a single molecule of the first gas is m_1 and the number of molecules in one volume is n_1 , then the total weight g_1 is obviously the product of m_1 and n_1 : $g_1 = m_1 n_1$. Similarly, if m_2 and n_2 are, respectively, the weight of a single molecule and the number of molecules of the second gas, then $g_2 = m_2 n_2$. But, the two volumes being equal, Avogadro's rule tells us that $n_1 = n_2$. Consequently we have

$$\frac{g_1}{g_2} = \frac{m_1 n_1}{m_2 n_2} = \frac{m_1}{m_2}.$$

In words: the ratio of the weights of two single molecules of different gases is the same as the ratio of the weights of equal volumes of the gases under the same conditions of pressure and temperature. And of course the weights of equal volumes of gases can be readily determined.

Chemists have agreed to call "molecular weight" or "molar weight" the weight of 22.407 liters of any gas or vapor at 0° C. and under a pressure of 1 atmosphere (i.e., 760 millimeters of mercury or, what is the same, a pressure of 1033.3 grams per square centimeter). The volume just mentioned is that occupied by exactly 32 grams of oxygen gas, and so 32 is given as the molecular weight, or molar weight, of oxygen.

In most cases it would be inconvenient, or even impossible, to put vapors at 0° C. under a pressure of 1 atmosphere; most vapors would be liquefied before this pressure is reached. In practice, therefore, the chemist determines the weight of some convenient volume (say 250 or 300 cubic centimeters at most) and under convenient conditions of pressure and temperature. Then, using the gas laws, he calculates what would be the weight of 22.407 liters under the normal conditions. The gas laws are mathematically expressed by the equation

$$PV = RT,$$

where V denotes the volume occupied by the molar weight of the gas under the pressure P and at the temperature T ; the symbol R denotes the so-called gas constant, and its numerical value (when volumes are measured in liters, pressures in atmospheres, and temperatures on the absolute scale) is 0.0820. If we denote by M the molar weight of a gas and by v its specific volume (i.e., the volume occupied by 1 gram), then obviously $V = Mv$. The equation of the gas laws may, therefore, be written:

$$PMv = RT, \text{ or } 0.0820T,$$

and therefore

$$M = \frac{0.0820T}{Pv}.$$

Thus in any given case the molar weight M becomes known if T , P , and v have been determined. This last equation may be referred to as the molar-weight formula.

Turning to the practical methods of carrying out such determinations, we find a method described by Menzies in 1910, which consists in fixing beforehand the temperature T and the specific volume v and determining what the pressure P will be when at the temperature T the gas has been forced to occupy, per gram, the volume v . In 1912 Porter described a practical procedure which consists in fixing beforehand the pressure and the specific volume and determining at what temperature the given vapor will under the pressure P occupy, per gram, the fixed volume v . Both these methods may be found explained in detail in the *Journal of the American Chemical Society*. The purposes of the present sketch will be served best by a description of the older, classic methods, which are still most commonly used in chemical laboratories. In these methods it is T and P that are fixed beforehand, and what is sought is the specific volume v of the gas under those fixed conditions of temperature and pressure. Following are the apparatus used:

A. *Dumas's Apparatus* consists of a light glass flask (of about 250 cubic centimeters' capacity), whose neck is bent and drawn out into a long and narrow point. After carefully weighing the flask, 15 or 20 grams of the substance to be examined are introduced into it; it is then immersed in a bath whose temperature is constant and from 30 to 50 degrees higher than the boiling temperature of the substance in the flask.

DUMAS'S APPARATUS.

The substance soon begins to boil, and its vapors drive all the air out of the flask. When the substance has completely evaporated and the flask contains nothing but its vapor, the open end is carefully sealed off with the aid of a blowpipe. On cooling, the flask is cleaned and again weighed. Finally, its end is broken off under water, which rushes into the flask owing to the low pressure within; and when the latter is completely filled it is weighed a third and last time, together with the end that has been broken off. From the three weighings the weight and the volume of the vaporized substance in the apparatus become known. Dividing the volume (expressed in liters) by the weight, we get the specific volume v required by the molar-weight formula given above. The temperature T is that of the bath; the pressure P is that of the air as shown by the barometer, but expressed in atmospheres. Dumas's apparatus can be employed only when a considerable amount of substance is available.

B. *Victor Meyer's Apparatus* consists of a wide glass tube a , the lower end of which is closed and the upper joined on to a long glass tube b of smaller diameter. The narrow tube is provided, near its upper end, with a side tube c . During a determination this apparatus is placed in a long test-tube-like vessel d containing some liquid boiling at a higher temperature

than the substance to be experimented upon. A little of the substance is carefully weighed in a small glass capsule; the rubber stopper closing the top end of the apparatus is for an instant removed, and the weighed capsule is dropped in. The substance quickly evaporates, driving out through the side tube c a volume of air equal to the volume of its own vapor. The air is collected in a graduated tube, and thus the volume of the vaporized substance becomes known. Di-

VICTOR MEYER'S APPARATUS.

viding the volume by the weight employed gives the required specific volume. The temperature T is that of the graduated tube at the time of observing the volume; the pressure P is that prevailing within the graduated tube at the same time—usually the same as the barometric pressure outside. Victor Meyer's apparatus requires but a very small quantity of the substance that is to be experimented upon, which is an important advantage; for the preparation of large quantities of a substance may often involve great loss of time and also be very difficult.

Effusion Method. An entirely different method of determining the relative molar weights of gaseous substances is based on a law discovered by Graham. When different gases are, under similar conditions, allowed to escape through a small opening, the lengths of time taken by equal volumes of the different gases to escape are proportional to the square root of the weights of those equal volumes. In other words, the weights of equal volumes of different gases are proportional to the square of the times of effusion. But as, according to Avogadro's Rule, the weights of equal volumes are proportional to the molecular weights, we may say: *the molecular weights of gases or vapors are proportional to the square of the times of effusion*, a proposition which may be called the Graham-Avogadro law. Denoting the times of effusion of two given

gases by t_1 and t_2 , and their molecular weights by M_1 and M_2 , we have

$$\frac{M_1}{M_2} = \left(\frac{t_1}{t_2}\right)^2$$

In practice one chooses as a reference substance some gas of known molecular weight, say oxygen, with the molecular weight 32 (M_2 in our formula), and determines the time of effusion of a suitable volume of it under practically convenient conditions of temperature and pressure (the time t_2 in our formula). Then one determines the time of effusion (t_1) of the gas whose molecular weight (M_1) is required. The latter is then given by the expression:

$$M_1 = M_2 \left(\frac{t_1}{t_2}\right)^2$$

A valuable advantage of the method consists in the fact that it requires but very small amounts of substance, so that Debiere was able to use it in the case of so scarce a substance as the emanation of radium. The method is much used as a test in the illuminating-gas industry. The gases are allowed to effuse out of a glass tube the open lower end of which is immersed in a cylinder of mercury, the upper end being sealed with a disk of platinum having an effusion hole whose diameter should be at most one four-hundredth of the thickness of the disk.

Determination of Molecular Weights by Direct or Indirect Measurement of the Osmotic Pressure of Solutions. As Van't Hoff has shown, substances in solution exert an "osmotic pressure" which is in a sense analogous to the pressure of gases or vapors and in very dilute solutions obeys the same law as the pressure of gases. If we denote by π the osmotic pressure, by V the volume (in liters) of solution containing the molar weight of the dissolved substance, and by T the absolute temperature, we thus have

$$\pi V = RT,$$

where R is again the "gas constant" and has the value 0.0820. If, further, we denote by v the volume of solution containing *one* gram of the dissolved substance, and by M the molar weight of the latter, our equation may be written:

$$\pi v M = RT,$$

from which we obtain a molar-weight formula analogous to the one given above for gases and vapors: viz.,

$$M = \frac{0.0820T}{\pi v}.$$

Thus, by measuring the osmotic pressure π of a solution of a given dilution at a given temperature, we can ascertain the molar weight M of the dissolved substance. But as the direct measurement of osmotic pressure is exceedingly difficult, indirect methods are usually employed by the investigator. When a substance enters some solvent, say water, it changes the characteristic freezing and boiling temperatures of the solvent; the freezing point is lowered, the boiling point is raised. Now, the depression of the freezing point and the elevation of the boiling point have been shown to be proportional to the osmotic pressure of the solution. Therefore, instead of directly carrying out a determination of osmotic pressure, the chemist measures the change of freezing or boiling temperature caused by dissolving a given weight of substance. The laboratory methods commonly employed in de-

termining the depression of freezing point and the rise of boiling point are described in the articles FREEZING POINT and BOILING POINT. See also SOLUTION; AVOGADRO'S RULE.

The osmotic-pressure methods just referred to are of the greatest practical importance to the chemist, for, while the number of substances that can be vaporized (and hence whose molecular weights can be determined by the vapor-density method) is limited, practically all substances can be obtained in solution.

Chemical Methods. It is often possible to determine the molecular weight of a substance by purely chemical methods, i.e., by studying its formation and chemical transformations. Consider, e.g., acetic acid. Analysis leads us to assign to it one of the following formulas: CH_2O , $\text{C}_2\text{H}_2\text{O}_2$, $\text{C}_3\text{H}_4\text{O}_3$, $\text{C}_4\text{H}_6\text{O}_4$, etc., corresponding to the molecular weights, 30, 60, 90, 120, etc. (See CHEMISTRY.) The fact that acetic acid is readily formed from ordinary alcohol, whose molecule ($\text{C}_2\text{H}_5\text{O}$) cannot possibly contain less than two carbon atoms (because for every two carbon atoms it contains a single atom of oxygen)—this fact renders it probable that the molecule of acetic acid, too, contains two carbon atoms. In other words, it becomes probable that $\text{C}_2\text{H}_4\text{O}_2$ is the formula, and hence 60 the molecular weight, of acetic acid. That CH_2O cannot be the formula of acetic acid is shown by the fact that the molecule ($\text{C}_2\text{H}_3\text{O}_2\text{Ag}$) of silver acetate, a compound made from acetic acid, cannot possibly contain less than two carbon atoms (because for every two carbon atoms it contains a single atom of silver). To sum up, the molecular weight of acetic acid is shown by purely chemical methods to be *probably* and *at least* 60. More exact information chemical methods cannot furnish. The *physicochemical* methods described above lead usually to much more definite conclusions. And because the molecular weights found by physical methods (i.e., on the basis of Avogadro's rule) are invariably found to be in perfect agreement with chemical facts, the molecular theory of the physicist can be, and is, inseparable from the atomic theory of the chemist, the two theories widening each other's scope of usefulness and together forming a powerful instrument for the study of nature.

See CHEMISTRY, and consult the literature of theoretical and physical chemistry recommended in that article. See also ATOMIC WEIGHTS; AVOGADRO'S RULE; BOILING POINT; FREEZING POINT; GASES, GENERAL PROPERTIES OF; SOLUTION.

MOLENAER, mō'le-när, JAN MIENSZE (?c.1605-68). A Dutch genre painter, born at Haarlem. He is thought to have been a pupil of Frans Hals, whom he imitated in his early works. Later he was influenced by Rembrandt. His pictures are usually scenes of peasant life, painted with much brilliancy and variety of characterization, combined, in his later works, with compactness of composition and subordination of local color to a warm brown tone. Good examples of his early manner are a "Scene in a Painter's Studio" (Berlin Gallery) and "A Family Party" (Van Loon collection, Amsterdam). In his later manner are "Grace before Meat" (Rijks-Museum, Amsterdam) and "A Flemish Wedding" (Haarlem). In 1636 he married Judith Leyster, one of the few distinguished women painters of that day.

MOLE RAT. One of the rodents of the family Spalacidae, which spend their lives moving

about through the soil like moles and have assumed many molelike features and traits. The countries about the Mediterranean contain the typical mole rat (*Spalax typhlus*), a queer, yellowish-brown creature about the size of a rat, with the minute eyes completely covered by the skin and the ears and tail rudimentary. Its fur lies either way, and the animal seems able to dig backward as well as forward. It constructs tunnels like those of moles, throwing out heaps of earth at intervals. It is common in Egypt, where it burrows in sandy soil full of asphodels and hyacinths, whose bulbs it eats or stores in large quantities in deep chambers underground. South Africa contains several closely related animals of the subfamily Bathyerginae, one of which, the coastwise strand mole (*Bathyergus maritimus*), is a foot long and numerous. Its eyes are still open, but are mere beads, of little use. Still stranger relatives of these are the sand rats (*Heterocephalus*) of Somaliland, which are about the size of mice, almost naked and blind. They remain always underground, tossing the sand out of the crater-like openings from their tunnels, but never themselves coming to the surface.

MOLESCHOTT, mō'le-shōt, JACOB (1822-93). A physiologist and writer on dietetics, born at Herzogenbusch, Holland. He studied at Heidelberg and began the practice of medicine (1845) at Utrecht. Thence he removed, in 1847, to Heidelberg, where for seven years he lectured on physiology at the university. A real or supposed tendency towards materialism in his lectures alarmed the authorities, and in consequence he resigned. In 1856 he was appointed professor of physiology at the polytechnic at Zurich and in 1861 at Turin. He was called upon to fill the same chair in Rome in 1879; three years earlier he had been appointed a Senator of the Kingdom. He was a popular lecturer; and his physiological researches, particularly in regard to diet, muscular formation, the blood, and bile, are of value. Without asserting the impossibility of a spiritual life, he explained the origin and condition of animals by the working of physical causes. His characteristic formula was "No thought without phosphorus." His most important works are: *Physiologie der Nahrungsmittel* (1850; 2d ed., 1859); *Physiologie des Stoffwechsels in Pflanzen und Thieren* (1851); *Der Kreislauf des Lebens* (1852; 5th ed., 1887); *Untersuchungen zur Naturlehre des Menschen und der Tiere* (1856-93; continued after his death by Colasanti and Fubini); *Lehre der Nahrungsmittel* (1858); *Sulla vita umana* (1861-67), a collection of essays; *Physiologisches Skizzenbuch* (1861); *Consigli e conferti nei tempi di colera* (1864; 3d ed., 1884); *Sull' influenza della luce mista e cromatica nell' esalazione di acido carbonico per l' organismo animale* (1879), with Fubini. *Kleine Schriften* (1880-87) contains his collected essays and addresses. After his death appeared his autobiography *Für meine Freunde* (1894).

MOLE SHREW. A book name for the common North American short-tailed shrew (*Blarina brevicauda*). See **SHREW**.

MOLE'SKIN (so called from its soft, thick shag, like the fur on a mole). An extra-strong double-twilled fustian, dyed after the pile is cut. See **FUSTIAN**.

MOLESWORTH, mōlz'wërth, SIR GUILFORD LINDSEY (1828-). An English civil engineer. He was educated at the college of civil

engineers at Putney. In 1852 he became chief assistant engineer of the London, Brighton, and South Coast Railroad, but soon resigned to conduct the constructions at Woolwich Arsenal during the Crimean War. After practicing his profession in London for a number of years he went to Ceylon in 1859 and in 1862 became chief engineer of the government railroad in that island. In 1867 he was appointed Director of Public Works and Director General of Railways to the Ceylon government and from 1871 to 1889 was consulting engineer to the Indian government with regard to State railways. He received medals from the British government for his services during the Afghan War and the Burma War. In 1904 he was president of the Institution of Civil Engineers. He published a *Pocket-book of Engineering Formulae* (27th ed., 1914), which is regarded as authoritative. Among his other publications are: *State Railways in India* (1872); *Metrical Tables* (1880; 4th ed., 1909); *Imperialism in India* (1885); *Silver and Gold* (1891); *Our Empire under Protection and Free Trade* (1902); *Economic and Fiscal Facts and Fallacies* (1909).

MOLESWORTH, MARY LOUISA, née STEWART (1839-1921). An English writer of books for young people, born in Holland and educated in Switzerland. She spent some time in France and Germany. She wrote several novels while young, and in 1875 published her first book for children. As a writer of juveniles her success was immediate. Through a delightful verisimilitude and an easy grace of style she found wide audience for many volumes, among which are: *Carrots* (1876); *Tapestry Poems* (1879); *The Green Casket* (1890); *The Laurel Walk* (1898); *The Grim House* (1899); *Jasper* (1906); *The Story of a Year* (1910); *Fairies Afield* (1911). Of *The Cuckoo Clock*, a classic of its kind, a new and handsome edition was published in 1914.

MOLESWORTH, SIR WILLIAM (1810-55). An English statesman, known as the originator of colonial self-government. He was born in London, May 23, 1810, and was descended from an old Cornish family of large possessions. He early showed promise of distinction, although his university career at Cambridge was cut short by his sending a challenge to his tutor to fight a duel. He continued his education at the University of Edinburgh and subsequently at Munich. He succeeded to the family baronetcy in 1823. After making the usual tour of Europe he returned home and threw himself in 1831 into the movement for parliamentary reform. Next year, although only just of age, he was elected member of Parliament for East Cornwall. He sat for Leeds from 1837 to 1841. He was the friend of Bentham, James Mill, and George Grote and was regarded as the parliamentary representative of the philosophical radicals. In 1839 he commenced and carried to completion, at a cost of £6000, a reprint of the entire miscellaneous and voluminous writings of Hobbes, which were placed in most of the English university and provincial libraries. The publication did him great disservice in public life, his opponents endeavoring to identify him with the freethinking opinions of Thomas Hobbes in religion as well as with the philosopher's conclusions in favor of despotic government. In 1845 he was elected to Parliament for Southwark, which he continued to represent until his death. He was the first to call attention to the abuses connected with the transportation of criminals

and as chairman of a parliamentary committee brought to light the horrors of the convict system. He pointed out the maladministration of the Colonial Office, explained the true principles of colonial self-government, prepared drafts of constitutions for remote dependencies, and made investigations as to the true and natural relations between the Imperial government and its colonial empire. Molesworth's views, although at first unwelcome to the legislature, were adopted by successive administrations and became part of the colonial policy of Great Britain. In January, 1853, he accepted the office of First Commissioner of Public Works in the administration of the Earl of Aberdeen and in 1855 the post of Secretary of State for the Colonies in that of Viscount Palmerston. Before he could give proof of his administrative capacity he died, Oct. 22, 1855. He established the *London Review*, a new quarterly, in 1835 and afterward purchased the *Westminster Review*, the organ of the philosophical radicals. The two quarterlies being then merged into one, under the title of the *London and Westminster*, Molesworth contributed to it many articles on politics and political economy. The enduring influence of his views was attested by the fact that his speech on the abandonment of the Orange River Territory in 1854 was advanced by the Boer government in 1878 as the chief argument for the British withdrawal from the Transvaal. Consult M. G. Fawcett, *Life of Sir William Molesworth* (London, 1901).

MOLESWORTH, WILLIAM NASSAU (1816-90). An English clergyman and historian. He was born at Millbrook, near Southampton, graduated M.A. at Cambridge in 1842, and entered the English church. He was presented to St. Andrews, Manchester, in 1841 and to St. Clement Spotland, Rochdale, in 1844. He was a strong advocate of coöperation and had an interest in the well-known experiment of coöperation in the industries at Rochdale. Molesworth's most important writings are: *Essay on the French Alliance* (1860); *A History of the Reform Bill of 1832* (1864); *History of England from the Year 1830 to 1874* (3 vols., 1874); *History of the Church of England from 1660* (1882).

MOLFETTA. An episcopal city in the Province of Bari delle Puglie, Italy, 16 miles northwest of Bari on the Adriatic Sea (Map: Italy, F 4). The city is pleasantly situated, and the old section, surrounded by walls studded with towers, presents a very striking aspect when approached from the sea. It has a twelfth-century Byzantine cathedral, a new cathedral, a lyceum, a Gymnasium, a seminary, a library with 22,000 volumes, a museum, and a theatre. A spacious harbor adds to the attractiveness of the new town and serves to render it an important commercial centre. There are extensive manufactures of flour, vermicelli, soap, bricks, and wine, and a large export trade in oil, almonds, carobs, nitre, and fish. Pop. (commune), 1901, 40,135; 1911, 43,263.

MOLIÈRE, mō'lyâr'. The name assumed by JEAN BAPTISTE POQUELIN (1622-73). The greatest dramatist and perhaps the greatest writer of France. Molière was born Jan. 15, 1622, in Paris. His father was a well-to-do tradesman and titular tapissier valet de chambre of the King, an office held later by Molière. Molière's mother died in 1632. He was educated by the Jesuits at the Collège de Clermont (1636-41) and came into touch with some literary men

(Luillier, Chapelle, Gassendi). Some say he went to Orléans to study law; others that he studied theology at the Sorbonne; and others still that he went with the court as a minor officer to Narbonne and formed Bohemian associations, among them being the Bégarts, whose daughter, Armande, he afterward (1662) married. In 1643 Molière abandoned his office and family prospects for the stage. After two unsuccessful theatrical ventures he was imprisoned for debt (1645), and in the winter of 1646-47 he became chief of a troupe of players which for 12 years (1647-58) acted in the provinces. In October, 1658, Molière played for the first time before the King, acting in *Nicomède* and *Le docteur amoureux*. In these years of wandering Molière learned the practical side of his profession; as dramatic adapter and composer he learned its literary side. More than all, he learned human nature by observing the provinces in the excited period of the Fronde from the vantage ground of an actor who could view objectively the panorama of high and low life; and at the same time as manager he gained seriousness from responsibility—a seriousness that gives his satire sometimes a tinge of bitterness and always the seal of superiority.

On Molière's return to Paris (1658) he had the prestige of provincial success, and he had written two plays which he thought worthy of preservation, *L'Etourdi* and *Le dépit amoureux*. These were sufficiently superior in their easy, natural dialogue and the alert brilliancy of their style to win for him a court patronage which he never lost and a popularity which assured his troupe a permanent support in Paris. This work was, however, Italian in spirit; but in 1659 Molière discarded, with *Les précieuses ridicules*, the stereotyped pattern, with its stock characters, and inaugurated a new era in comedy with the first dramatic satire on cultured society in France. Not the affected language and manners of the Hôtel de Rambouillet, but those, rather, of its bourgeois imitators, who abounded in Paris, were ridiculed with such infinite good humor that the play has not yet lost its comic force.

As typical of Molière's genius, though of a quite other phase of it, is *Sganarelle* (1660), the first of those gay yet profound farces that still hold the stage because they evoke first a laugh and then a thoughtful smile. He was still feeling his way, and *Don Garcie de Navarre* (1661), a five-act tragi-comedy in verse, marks a relapse to the traditions of the Spanish stage. *L'Ecole des maris* (1661) shows, however, a decided advance. The plot is from Terence, but the aged lover is treated with a pathos and a fidelity to nature that bear the print of genius. From this point onward it becomes necessary to distinguish the work of Molière the born dramatist from that of Molière the theatrical manager and purveyor of court entertainments. He wrote very much in the latter capacity that he would not have written in the former. The financial success and prosperity of his company were also an obligation not to be neglected. To satisfy this he wrote conventional comedies and extravagant farces, and to please the royal taste he composed for festivals at Versailles some 13 semioperatic comedies, in which the text was only a pretext for dancing and singing, wherein high dignitaries of the court sometimes took part. He was distracted, too, by bitter attacks which he condescended occasionally to answer in his farces, though such controversy seems to

have spurred him to his greatest efforts and lent a keener edge to his attacks on hypocrisy and pharisaism.

Les fâcheux (The Bores), a comedy ballet in three acts, acted at Vaux (August, 1661) for Fouquet on the eve of his downfall, illustrates this diversion of genius and is interesting because Louis XIV suggested one of its scenes; *L'Ecole des femmes*, which follows (December, 1662), is an exhibition of Molière's mature art as a satirist aiming at social and moral reformation, and *La critique de l'école des femmes* with *L'Impromptu de Versailles*, which immediately follow this in 1663, are answers to the criticism that it evoked—criticism embittered by Molière's success and given a handle by his marriage (February, 1662) to Armande Béjart. She was probably the sister of an old member of his company, herself an actress, and her indiscretions were a source of constant vexation and jealousy to Molière.

L'Ecole des femmes is the first of Molière's great comedies, the first great serious comedy of French literature. It deals with the part of woman in society and her proper preparation for it and treats both in a spirit more liberal than the France of to-day wholly approves. This alone would have insured violent criticism, but to it was added a bold and contemptuous satire on the prevalent materialistic views of future punishment. The play was denounced, not merely as vulgar and obscene, but as impious, e.g., by Boursault in his *Portrait du peintre*. Boursault was answered by name in the merciless *Impromptu de Versailles*, where, too, the rival company of the Hôtel de Bourgogne were parodied and ridiculed.

This controversy had by no means subsided when Molière, after the trivial *Mariage forcé* (1664) and *La princesse d'Élide* (1664), two comedy ballets, provoked redoubled fury by two attacks on hypocrisy, *Tartufe* and *Don Juan*, or *Le festin de Pierre*. Of the former, only three acts were presented in 1664. Jesuits and Jansenists alike winced at it, and five years of persistent effort barely extorted permission to present the masterpiece as a whole. *Don Juan* appeared in February, 1665, and in August the King significantly adopted Molière's troupe as his own. But even his sympathy had its limits, and this appointment was perhaps in the nature of a consolation for the suppression of *Don Juan* in the midst of a prosperous run. The full text of this play is preserved to us only in a copy kept by the chief of police.

While awaiting permission to act *Tartufe* in its entirety, with *Don Juan* forbidden, Molière wrote *L'Amour médecin* (1665), a clever attack on the medical practitioners of his day, and *Le misanthrope* (July, 1666), in which his rivals and critics rightly discerned "a new style of comedy," wherein the constant motive forces of universal human nature are shown modified by the highest refinement to which civilization had yet attained. The easy optimist is set off against the noble pessimist, and a social school for scandal supplies the lighter comedy and offers a pillory for fops and poetasters.

About this time Molière's health seems to have begun to fail. Cold and fatigue brought on a disease of the lungs, and what he says of the distracted and pedantic doctors of his day, when superstition and tradition were struggling with one another and with half-understood fragments of science, lent sad point to the *Médecin malgré*

lui, the second of his noteworthy attacks on the quackery of that time. Then follows a period of relaxed activity with only three comedy ballets, *Mélicerte* (1666), *Le pastoral comique* (1667), and *Le Sicilien* (1667), followed by the comparatively insignificant *Amphitryon* (1668), a coarse yet witty adaptation from Plautus. In July of 1668 Molière shows his old self again in *George Dandin*, an immortal type of the man who marries above his social station and suffers the consequences with rueful self-accusation. The story is at least as old as Boccaccio, but Molière's squirarchy Sotenvilles are his creation and an abiding delight.

This little master stroke was followed in September, 1668, by a masterpiece, *L'Avare*, whose central figure, the caricatural Harpagon, is one of Molière's greatest studies of vitiated character. Several lighter pieces followed, first *M. de Pourceaugnac*, a comedy ballet with much railery at the physicians; then *Les amants magnifiques* (1670), a persiflage of astrological extravagances; then that excellently comic farce, *Le bourgeois gentilhomme* (1670); then *Psyché* (1671), a tragedy ballet, written in collaboration with Corneille and Quinault. The music was by Lulli. Then followed the lively *Fourberies de Scapin* (1671) and finally the *Comtesse d'Escarbagnas*, a study of provincial manners and an attack on financiers, heralding thus Lesage's *Turcaret*. Much greater than any of these are the last legacies to French comedy of the dying Molière, *Les femmes savantes* (1672) and *Le malade imaginaire* (1673). The former recurs to the subject of the *Précieuses ridicules* and with ripest power attacks the admirers of pedantry and the affectations of learning. The latter, primarily a last gibe at physicians, is important for its widening of satiric comedy to include the perversion of childhood.

Le malade imaginaire was first acted Feb. 10, 1673. On the seventeenth Molière undertook the part of the hypochondriac invalid, though suffering from what he called a fluxion. In a fit of coughing he burst a blood vessel on the stage and died at his house a half hour later. His enemies pursued him in death. He was buried half clandestinely. The Archbishop of Paris, thinking Molière's ethics irreconcilable with Christianity, forbade public ceremony, but the command was evaded. The body was laid in St. Joseph's churchyard, but the site of the grave is uncertain.

No dramatist, save perhaps Shakespeare and Aristophanes, ever joined so much wit to so much seriousness as did Molière. There is often a pathetic, even a sad background to his scenes, but this never gets the better of his healthy humor. This humor depends for its effects not so much on plot as on revelation of character, and the satire is directed not so much against the excesses of nature as against those social faults or conventions which disguise or suppress nature. He is more apt to typify phases of character than to present complex natures, and in doing this he gave direction to the development of French comedy for several generations. There is no question that in the analysis of character Shakespeare, even Corneille, is more profound, and they tell a story with more dramatic force, but neither Corneille nor Racine gives so accurately picturesque, so fascinatingly truthful a portrait of French society as we find in the naturalistic, observant humorist, Molière.

Of Molière's *Works* the first edition was by his

friends and fellow actors, La Grange and Vinot (1682); by far the best is Despois and Mesnard's (11 vols., 1873-96). Excellent also are the editions of A. France (7 vols., 1876-91) and Monval (10 vols., 1879-89). One of the first English translations of Molière's Works appeared in London in 1748 in 10 volumes. There is a good cheap edition in two volumes with a study by Sainte-Beuve and English translations by Van Laun (6 vols., London, 1875-77), Wall (3 vols., 1876-77, 1891-1901), and K. P. Wormeley (Boston, 1894-97). Waller published an English and French edition (8 vols., Edinburgh, 1907). *Plays from Molière* translated by English dramatists, edited by Henry Morley, appeared in London in 1883. Consult for Molière's style, vocabulary, and usage, C. L. Livet, *Lexique de la langue de Molière* (Paris, 1895-97). Of the *Lives* of Molière that of Mahrenholtz, in German (Heilbronn, 1881), is most comprehensive. Consult also the periodical *Le Moliériste* and the biographies by F. Lotheissen (Frankfort, 1880), Moland (Paris, 1886), Gustave Larroumet (ib., 1886), Paul Mesnard (ib., 1889), Desfeuilles (ib., 1900), and Heinrich Schneegans (Berlin, 1901); the full *Bibliographie molièresque*, by Paul Lacroix (Paris, 1875); L. H. Vincent, *Molière* (Boston, 1902); H. M. Trollope, *Life of Molière* (New York, 1905); H. C. Chatfield-Taylor, *Molière* (ib., 1906); Martineche, *Molière et la théâtre espagnol* (Paris, 1906); E. Rigal, *Molière* (1910); Brander Matthews, *Molière, his Life and his Works* (New York, 1910); M. I. Wolff, *Molière, der Dichter und sein Werk* (Munich, 1910); D. H. Miles, *Influence of Molière on Restoration Comedy* (New York, 1910); Emile Faguet, *Rousseau contre Molière* (Paris, 1912); also Currier and Gay (comps.), *Catalogue of the Molière Collection in Harvard College Library* (Cambridge, Mass., 1906).

MOLIÈRE, HOUSE OF. See COMÉDIE FRANÇAISE.

MOLINA, mò-lé'ná, ALONSO DE (c.1510-c.85). A Spanish missionary in Mexico. He was born at Escalona, Spain, early went to Mexico, learned the Aztec language, and was interpreter to the Franciscan friars. He subsequently joined the Franciscan Order and rose to be the superior of Santo Evangelio Province. His publications include translations into Aztec of the catechism and of a confessional manual, and a grammar of that language. His greatest work is his *Vocabulario en lengua castellana y mexicana* (1555; rev. ed., 1571), containing both Spanish-Mexican and Mexican-Spanish parts.

MOLINA, COUNT OF. See CARLOS, DON.

MOLINA, JUAN IGNAZIO (1740-1829). An historian of Chile. He was born at Talca, Chile, studied in a Jesuit college at Santiago, taught there and at Bocalmo, and at the age of 20 became librarian at Santiago. He joined the Jesuits and on their expulsion from the country went to Italy in 1767. For several years he was a priest at Imola and in 1774 went to Bologna, where he taught in a private school. His views of the vitality of matter and of the sensibility of metals brought him into disfavor with the Church and he was removed from his professorate for a time. A legacy which Molina received in 1815 was devoted entire to the foundation of a library in Talca. Works: *Compendio di storia del Chile* (1776); *Saggio sulla storia naturale del Chile* (1782); *Saggio della storia civile del Chile* (1787).

MOLINA, LUIS (1535-1600). A celebrated Spanish theologian, specially famous in the history of the controversy about divine grace. He was born at Cuenca in New Castile, entered the Jesuit Order at the age of 18, studied and then taught theology and philosophy at the College of Coimbra in Portugal, and was later appointed professor of theology at Evora, where he taught for 20 years. He then returned to Spain to devote himself to literary work and six months before his death was appointed professor of moral theology in a Jesuit school in Madrid. His fame rests mainly upon his celebrated work, *Concordia Liberi Arbitrii cum Grantiæ Donis*, first printed in Lisbon in 1588, but not published until the following year. It was the first work of formal scholastic theology produced by the Jesuit Order, as it was the first written by any of them in the nature of a commentary on St. Thomas Aquinas, and scarcely any theological work has ever excited so widespread and lasting a controversy. The latest edition of it is by Lethilleux (Paris, 1876). (For further details of this controversy, see MOLINISM.) Among his other works are his commentaries on the first part of the *Summa* of Aquinas (1592) and *De Justitia et Jure* (1592). His complete works were published in seven volumes (Venice, 1614) and with biography and bibliography in five volumes (Cologne, 1733).

MOLINA, TIRSO DE. A pseudonym of the Spanish dramatist Gabriel Téllez (q.v.).

MOLINARI, mô-lé'ná-ré', GUSTAVE DE (1819-1911). A Belgian political economist, born at Liège. He became a physician at Brussels, wrote works on homœopathic medicine, removed to Paris (1843), where he gained some distinction as a radical journalist, but was obliged by the coup d'état (1851) to return to Belgium, and there was appointed professor of political economy in the Musée Royal de l'Industrie Belge (Brussels) and later at Antwerp. In 1857 he went back to Paris, and in 1874 he was elected corresponding member of the Academy of Moral and Political Sciences of the Institute of France. He became editor of the *Journal des Débats* (1867) and of the *Journal des Economistes* (1881). From 1873 to 1875 he traveled and published his observations on the United States in *Lettres sur les Etats-Unis et le Canada* in 1875. He assisted in establishing the journals *L'Economiste Belge* and *La Bourse du Travail* and published numerous works, including *Etudes économiques* (1846); *Questions d'économie politique et de droit public* (2 vols., 1861); *L'Evolution économique du XIXème siècle* (1880); *Le droit de la paix et de la guerre* (1887); *Comment se resoudra la question sociale* (1896); *Questions économiques à l'ordre du jour* (1906); *Théorie de l'évolution* (1908).

MOLINE, mò-lên'. A city in Rock Island Co., Ill., on the Mississippi and Rock rivers and on the Hennepin Canal, 3 miles east of the county seat, Rock Island, which is opposite Davenport, Iowa, the three cities being closely connected by steam and electric railroads, ferries, and bridges (Map: Illinois, D 2). The railroads entering the city are the Chicago, Milwaukee, and St. Paul, the Chicago, Rock Island, and Pacific, and the Chicago, Burlington, and Quincy. Moline derives excellent water power from the Mississippi, which is here dammed from the shore to the mid-river island,

an advantage which has contributed materially to the city's importance as an industrial centre. Coal is mined in the vicinity, and besides extensive automobile and plow works, there are manufactories of steel, elevator and milling machinery, scales, pianos, organs, furniture, carriages and wagons, steam engines, saw and planing mill products, foundry and machine-shop products, and pumps. A large trade is carried on in machinery, farming implements, grain, lumber, etc. Moline has a high-school library and a large public library, a park system comprising 150 acres, a fine city hall, and a well-equipped city hospital. Of interest in the vicinity are Black Hawk Watch Tower, Campbell's Island, and the Rock Island Arsenal. Moline has adopted the commission form of government. The water works are owned and operated by the municipality. Pop., 1900, 17,248; 1910, 24,199; 1914 (U. S. est.), 26,403; 1920, 30,709.

MOLINET, mô'lě'nâ', JEAN (?-1507). A French poet and troubadour. He was a canon of the college church of Valenciennes, chronicler of the house of Burgundy, and librarian to Margaret of Austria, then Regent of the Low Countries. Molinet was one of the "grands rhétoriqueurs"; his poetry is pedantic, heavy, and complicated in rhythm, and his prose full of Latinisms, while both are replete with astonishing puerilities. A volume of his poems was printed in 1531, and his chronicles were published by Buchon in 1828. He also made a prose translation of the *Roman de la rose* (1503).

MO'LINISM. The name commonly applied to the doctrine of Luis Molina on the relation between divine grace and the will of man. The problem which it is meant to solve is as old as the fourth century, when it led to the well-known Pelagian controversy. (See PELAGIANISM.) In reconciling with the freedom of man's will the predestination of the elect to happiness and of the reprobate to punishment, Molina asserts that this predestination is consequent on God's foreknowledge of how man's will would act under any conceivable combination of circumstances, and that therefore it in no way affects the freedom of the particular actions. Accordingly, God gives to all men sufficient grace to enable them to live virtuously and merit happiness; certain individuals freely respond to this grace, while others resist it; God foresees both courses and founds His decrees upon this knowledge. This exposition was assailed in the schools first as a revival of the Pelagian heresy, inasmuch as it appears to place the efficacy of grace in the consent of man's will, and thus to recognize a natural power in man to perform supernatural acts; secondly, as setting aside altogether what the Scriptures represent as the special election of the predestined, by making each individual the arbiter of his own predestination or reprobation. The Dominicans, who were never very friendly to the Jesuits and who felt that this teaching misrepresented that of their great authority, St. Thomas, entered fiercely into controversy; the name of Thomists is generally applied to them and to the other antagonists of Molina. The dispute was brought under the cognizance of the Inquisitor General of Spain, who referred it to Pope Clement VIII. In 1597 he appointed the celebrated Congregatio de Auxiliis Divinæ Gratiæ to consider the entire question; the commission consisted of 11

members, representing different orders and schools. Before the death of Clement VIII in 1605 it had already held 68 sessions, and 17 more were held under Paul V, still without leading to any very definite result. Paul V finally dissolved it after nine years of anxious consultation and in 1611 forbade anything to be printed on either side without license from the Inquisition. The decree was confirmed by Urban VIII in 1625 and again in 1641, with special reference to a new outbreak of controversy occasioned by the publication of the *Augustinus* of Jansenius. The Jesuits had never committed themselves to Molina's doctrine as a whole, and they came gradually to a general support of a modified form of it known as congruism, taught especially by Suarez (q.v.) and Bellarmine (q.v.). While, according to the supporters of this teaching, Molina had placed the effective power of grace altogether in the assent of the free will, Suarez found it rather in the perfect harmony (*congruentia*) of grace with the character, temperament, tendencies, and habits of the individual. The real congruism of Suarez is, however, not so much a departure from the teaching of Molina as a clearer and more precise definition of it. Consult: Gerhard Schneemann, *Die Entstehung und Entwicklung der thomistisch-molinistischen Kontroverse* (Freiburg, 1880); De Régnon, *Baños et Molina: histoire, doctrines, critique métaphysique* (Paris, 1883); Gayraud, *Thomisme et Molinisme* (ib., 1890).

MOLINO DEL REY, mô-lě'nô del rá'è (Sp., King's Mill). A series of massive stone buildings about 3000 feet west of Chapultepec (q.v.) and about 3 miles southwest of the city of Mexico; the scene, Sept. 8, 1847, of the most hotly contested battle of the war between the United States and Mexico. At the close of the armistice which followed the battle of Churubusco (see MEXICAN WAR) General Scott determined to destroy a cannon foundry and some military supplies supposed to be located here and on September 7 ordered an attack. Early on the following day General Worth, at the head of about 3100 men, assaulted the buildings, which had been strongly fortified and were then garrisoned by a force of 4000. After suffering severely from the artillery fire the Americans finally drove the Mexicans from their position and held the fortifications for the rest of the day, in spite of a large Mexican reinforcement sent forward by Santa Anna. Of the Mexicans 690 were made prisoners and probably as many as 3000 were killed or wounded. The American loss was heavier, in proportion to the force engaged, than in any other battle during the war, 116 being killed and 671 wounded. The Mexicans, supposing the attack to be part of a movement against Chapultepec (q.v.), regarded the engagement as a victory for their side and still commemorate it as such. Consult: H. H. Bancroft, *History of Mexico*, vol. v (San Francisco, 1885); Wilcox, *History of the Mexican War* (Washington, 1892); R. M. McElroy, *The Winning of the Far West* (New York, 1914).

MOLINOS, mô-lě'nôs, MIGUEL DE (1640-96). A Spanish mystic and leading representative of the doctrines of Quietism. He was born at Patacina in Aragon of noble parents and pursued a course of theological studies at Pamplona and Coimbra, from which university he received the degree of doctor of divinity. Hav-

ing been ordained priest, he acquired a high reputation as a director of conscience and a master of the spiritual life. He went in 1669 to Rome, where he made the same impression and won the friendship of many distinguished people. He declined all preferment and devoted himself entirely to the direction of souls. In 1675 he published an ascetical treatise in Spanish, under the name of *The Spiritual Guide*, which had a wide popularity and was translated into many languages (into English 10 years later; reprinted at Glasgow, 1885). His leading principle was that of habitual abstraction of the mind from sensible objects, with a view to gain, by passive contemplation, not only a profound realization of God's presence, but so perfect a communion with Him as to end in absorption into His essence. The dangers of his doctrine (for an examination of which and its subsequent history, see QUIETISM) were pointed out by not a few, among them the distinguished Jesuit Segneri; but so great was the popularity of Molinos that no decisive steps were taken until, in 1685, he was cited before the Holy Office and submitted to close imprisonment and examination. The Inquisition finally condemned 86 propositions extracted from his writings and in a decree, which was confirmed a few months later by a bull of Pope Innocent XI, required him publicly to abjure them and sentenced him to imprisonment for life. He underwent public penance and was admitted to absolution, but was detained until his death in 1696. Consult John Bigelow, *Molinos the Quietist* (New York, 1882), and J. S. Short-house, *Golden Thoughts from the Spiritual Guide of Molinos* (London, 1883).

MOLIQUE, mō'lēk', WILHELM BERNHARD (1802-69). A German violinist and composer, born at Nuremberg. His father was a musician, and the boy studied various instruments, but finally devoted himself to the violin. In 1815 he received some lessons from Spohr and then studied for two years under Rovelli in Munich. In 1820 he succeeded Rovelli as court violinist and after several successful tours became leader of the Royal Band at Stuttgart in 1826. In 1849 he resigned to go to England, in which country he remained till 1866, when he returned to Cannstadt, near Stuttgart, where he died. His compositions, especially his six violin concertos, are still in use.

MOLISE. See ABRUZZI E MOLISE.

MOLITOR, mō'lē'tōr', GABRIEL JEAN JOSEPH, COUNT (1770-1849). A French soldier, born at Hayange (Lorraine). He became a captain of volunteers in 1791, by 1799 had risen to the rank of general of brigade, having fought under Hoche, Massena, and Moreau. Subsequently he was commissioned a general of division and in 1805 fought in the Army of Italy and took part in the battle of Austerlitz. In 1806 he was appointed Governor of Dalmatia and in 1807 Governor of Pomerania, in 1809 contributed to the victory of Wagram, and in 1811-13 was in Holland. He was appointed inspector general of infantry at the Restoration, but received a command in Alsace from Napoleon during the Hundred Days. After the Second Restoration he did not again obtain his offices until 1818. In 1823 he commanded the Second Army Corps in the Spanish expedition and defeated Ballesteros, for which he was commissioned marshal. In 1847 he became commandant of the Invalides and was made

Grand Chancellor of the Legion of Honor in 1848.

MOLKO, SOLOMON. See MESSIAH.

MOLLAH (more properly Ar. *maulā*, Turk. pron. *mevla* or *mullā*). Among the Turks, the title of a superior judge. The mollahs are divided into two classes. Those in the first class exercise jurisdiction over the more important pashaliks. The mollahs of the second class hold office for a lunar month at a time, and their lowest rank is composed of the naibs over the inferior provinces, towns, and villages. The mollah is an expounder of civil, criminal, and canon law; he must, therefore, be a lawyer as well as an ecclesiastic. Under him is the qadi (or kadi), the judge who administers the law, and superior to him are the kadilesker and the mufti (q.v.). They are all, however, subject to the Sheikh ul Islam, who is the supreme mufti. In Persia the office of mollah, who is generally called akhun, is similar to what it is in Turkey. This superior there is the sadr, or chief of the mollahs. In the Mohammedan church the mollahs are beneficed clergy in receipt of some small salary attached to mosques and other pious foundations.

MOLLENDÓ, mōl-yén'dō. A coast town in the Department of Arequipa, Peru (Map: Peru, C 7). It is the principal port of south Peru and one of the chief points through which Bolivian trade is carried on. It is connected by railway with the mining districts of the interior of Peru and with Bolivia (La Paz). It exports alpaca wool, quinine, tin, gold, antimony, silver, and copper ores and imports chiefly merchandise for Bolivia. In 1913 its imports amounted to £580,802 and its exports to £1,104,580, giving it second rank in the former and third rank in the latter among the ports of Peru. It is the seat of a United States consular agent. Pop. (est.), 4000.

MÖLLENDORF, mē'l-en-dōrf, RICHARD JOACHIM HEINRICH VON (1724-1816). A Prussian general, born at Lindenbergh in Brandenburg. He was in the first and second Silesian wars and was made a captain for bravery at Soor (1746). In the Seven Years' War he rose to the rank of major and received the Order for Merit. At Torgau (1760), where he showed great bravery, he was captured by the Austrians, but he was released in 1761 and was made general a year after. Möllendorf was division commander in the War of the Bavarian Succession (1779), during which he received the Order of the Black Eagle; Governor of Berlin (1783); and commander in 1793 of the troops which put into effect the second partition of Poland, having been made field marshal. He was appointed commander in chief of the Army of the Rhine in 1794. In 1806 he again took the field, was wounded at Auerstädt and captured at Erfurt, but was released by Napoleon, who gave him the cross of the Legion of Honor.

MÖLLENDORF, ULRICH VON WILAMOWITZ-. See WILAMOWITZ-MÖLLENDORF, ULRICH VON.

MOLLENHAUER, mōl'en-hou'ēr, EMIL (1855-). An American orchestra and choral conductor. He was born in Brooklyn and was educated at Russell's Academy, New York. He became a member of Booth's Theatre Orchestra in 1869, first violin of the Theodore Thomas Orchestra in 1871, and a member of the New York and Brooklyn Philharmonic societies. Moving to Boston in 1884, he was a member of

the Boston Symphony Orchestra for four years, and served as conductor of the Germania Orchestra and the Municipal Concerts until 1903. He afterward served as conductor of the Handel and Haydn Society and of the Boston, Lynn, Brockton, Newburyport, and Salem oratorio societies.

MOLLER, GEORG (1784-1852). A German architect. He was born in Hanover and studied architecture in Karlsruhe and Italy. After his return from Italy he was appointed court architect to the Grand Duke of Hesse. He designed the ducal palace at Wiesbaden, a number of public buildings and private residences at Darmstadt, and the theatre at Mainz. He discovered the original design of the Cologne Cathedral, the two towers of which have been finished in accordance with his published facsimile. His most important publications include *Denkmäler deutscher Baukunst* (1815-31) and *Beiträge zu der Lehre von den Konstruktionen* (1833-44).

MÖLLHAUSEN, mēl'hau-zen, BALDUIN (1825-1905). A German traveler and novelist, born at Bonn. He studied agriculture in Pomerania and spent several years in North America, traveling with Duke Paul of Württemberg (1851) and, at the instance of Humboldt, acting as draftsman to a scientific expedition to the Far West. After a second trip through the western part of the United States, especially Colorado, he wrote *Tagebuch einer Reise vom Mississippi nach den Küsten der Südsee* (1858) and *Reisen in die Felsengebirge Nordamerikas* (1861). His many novels, mostly on American topics, include: *Die Halbindianer* (1861); *Das Mormonenmädchen* (1864; 3d ed., 1871); *Das Monogramm* (1874); *Die beiden Yachten* (1891); *Fegefeuer in Frappes Wigwam* (1901). His *Illustrierte Romane, Reisen, und Abenteuer* were published in three series and 30 volumes (1906-13).

MOLLIER, mōl'yān', NICOLAS FRANÇOIS, COUNT (1758-1850). A French statesman, born in Paris. Early connected with the financial department of the French government, by 1784 he had charge of raising the taxes through the farmers-general. He narrowly escaped with his life during the Revolution, and in 1794 he retired to England for a time. He reentered the ministry of finance under Gaudin in 1799, and when Napoleon became Emperor in 1804 Mollier was made a member of his Privy Council. Napoleon, who consulted him frequently on financial matters, made him Minister of the Treasury in 1806 and created him Count in 1808. He retired upon the first abdication of Napoleon in 1814, but again took up his ministerial duties during the Hundred Days in 1815. He lived in retirement under the Restoration and in 1819 was made a peer of France. He wrote *Mémoire d'un ministre du trésor publique 1780-1815* (Paris, 4 vols., 1845; new ed., 3 vols., 1898).

MOLLITIES (mōl-lish'ēz) OS'SIUM. See OSTEOMALACIA.

MOLLUS/CA (Lat. nom. pl. neut. of molluscus, from mollis, soft). One of the chief divisions, or phyla, of the animal kingdom, the study of which is conchology or malacology. The body is bilaterally symmetrical except in snails (Gastropoda), not segmented as in worms and arthropods, but soft, fleshy, and usually protected by a bivalve or univalve shell; moving by a "foot" or muscular creeping disk in gastropods, or, in bivalves, by a tongue-like process;

breathing by external gills which are either lamellate or plumelike. A shell is secreted by the fleshy mantle, and in nearly all except the Pelecypoda (q.v.), which are headless, the mouth is armed with an odontophore, an apparatus of muscles and tendons bearing a rasp-like lingual ribbon (radula) for sawing or cutting the food or for drilling holes through shells. Many mollusca in their young or larval swimming stages begin as a trochosphere (q.v.), pass through a veliger stage, living at the surface of the sea and gradually sinking to the bottom by gravity as the shell grows larger and heavier. The Mollusca form a highly specialized group, the number of species amounting to upward of 40,000, about one-half of which are living, the other extinct; the earliest known species occur in Cambrian rocks. The group has a wide geographical and bathymetrical range, occurring in all seas from the shore to the abysses of the ocean and also on land and in fresh waters.

A SEGMENTED LARVA.
Trochosphere of Chiton.

The affinities of this phylum are not yet settled. Mollusks have evidently descended from some wormlike form, as their larvae are in some cases segmented and like the trochosphere or trochophore stage of seaworms (Annelida). In the adult segmental organs like those of worms are often present. On the whole they are a grade inferior to the spiders and insects. Mollusks are divided into five classes, i.e., (1) Amphineura (q.v.); (2) Pelecypoda (q.v.) or Lamellibranchiata; (3) Scaphopoda (q.v.); (4) Gastropoda (q.v.); and (5) Cephalopoda (q.v.). The Amphineura comprise a few forms formerly supposed to be worms (Chaetoderma and Neomenia). These are primitive types from which, as some authors think, the other mollusks may have descended; all have a ladder-like nervous system, as in Chiton, and are either shell-less or somewhat like that of some Turbellaria (q.v.) and Peripatus (q.v.).

Bibliography. A. H. Cooke, "Molluscs," in *Cambridge Natural History*, vol. iii (New York, 1895); A. F. Arnold, *Sea-Beach at Ebb-Tide* (ib., 1901); A. G. Mayer, *Sea-Shore Life* (ib., 1905); J. E. Rogers, *Shell Book* (ib., 1908); S. P. Woodward, *Manual of the Mollusca* (4th ed., London, 1890); W. H. Dall, *Land and Fresh Water Mollusks* (Washington, 1910). See MOLLUSK.

MOLLUS/CUM CONTA/GIO/SUM. A comparatively rare skin disease occurring chiefly in children of the poorer class and believed to be contagious. Upon the skin are observed waxy-white, semiglobular, smooth elevations varying in size from a pinhead to a pea. The tumors consist of degenerated epithelial cells contained in the globules of hair follicles. The lesions are distributed chiefly upon the face, increase slowly in size and eventually suppurate; or they may be destroyed by incision, after which the contents are squeezed out or curetted away. Ointments containing mercury are sometimes efficacious.

MOLLUSK. An animal of the phylum Mollusca (q.v.). Mollusks are usually easy to distinguish from other animals on account of their shell, whence they are commonly called shellfish; but the more we study their development

and morphology the more difficult is it to draw a definite line between them and certain worm-like forms. In their early development they travel along apparently the same developmental path as the worms (planarians as well as annelids) and then diverge into a separate path. That the type is a very successful one is proved

TRANSVERSE SECTIONS OF BIVALVE MOLLUSKS.

A clam (*Mya*) and a fresh-water mussel (*Unio*), showing the ligament (*L*) and adductor muscle (*M*).

by the enormous number of species both living and extinct—a success evidently due to the protection afforded them by their shell. In bivalves as well as univalves (Gastropoda) the shell is more or less solid, is composed mainly of carbonate of lime and secreted by the mantle.

A bivalve mollusk like the clam is completely protected by a pair of solid calcareous shells connected by a hinge consisting of a large tooth (in most bivalves there are three teeth) and ligament. The shells are equivalent or with both valves alike, but unlike at each end, the head end being more rounded. On the interior are two muscular impressions, or scars, made by the two adductor muscles. The shell of gastropods is spiral, and that part of the animal contained in the skin is asymmetrical, the twist or torsion being due to gravity or lopping over of the young shell in the larva stage.

As to the most primitive forms we are in the dark. The most characteristic mollusks are the cephalopods. They are bilateral and very highly modified, with a well-marked head containing two highly specialized eyes and two ears. The concentrated ganglia form a brain with cartilaginous protections, while the parts around the mouth are modified to form the tentacles and funnel. The heart and blood vessels are highly specialized.

The "foot" is a modification of the part of the mantle below and behind the mouth; it varies

A BIVALVE MOVING.

A fresh-water mussel (*Unio*) moving through the sand towards the left by means of its extended "foot."

greatly in shape, and is by disuse wanting in oysters and other fixed forms; in the pelecypods or bivalves it is tongue-shaped, and by being filled with water is thrust out between the valves of the shell, so that by means of it the clam can dig deep into the mud, or the fresh-water mussel can plow its way through the

sand. In the snails (q.v.) the foot forms a flattened creeping disk extending along the whole length of the body. See illustrations under CONE SHELL; CONCH; ETC.

In the clam (q.v.) and most bivalves the hinder end of the body is prolonged into a double siphon, popularly called the head, through the lower division of which enters the water laden with microscopic animals and larvæ, which pass through the mantle cavity into the mouth, which is situated at the opposite end from the siphons. The upper division of the siphon opens out opposite the end of the intestine, which makes two and a half turns in the central or visceral mass, which is composed mostly of the ovaries. The bivalves breathe by a pair of leaflike gills, on each side of the visceral mass between it and the mantle; in the gastropods and cephalopods the gills are plume-like processes, called ctenidia. There is in mollusks a definite heart, which in the primitive forms is three-chambered, i.e., a ventricle and two auricles. The ventricle in the clam and most other bivalves surrounds the intestine; the arteries and veins are well developed; the blood is colorless. Mollusks as a rule differ from other animals in the nervous system, the ganglia, connected by threads (commissures), being grouped around the œsophagus, one pair (the brain) situated above; another, the pedal ganglia, in the foot, and the pair of visceral ganglia, nearer the middle of the body, and innervating the siphon, gills, digestive canal, and heart. See GASTROPODA; CLAM; OYSTER; DECAPODA; and the accompanying illustrations and plates.

Sense organs vary much in situation, number, and size. The eyes of the scallop, which leads an active life, leaping out of the sand and skipping over the surface, are large, highly developed, and numerous, being situated around the edges of the mantle; in those mollusks which burrow (clam) or are fixed (oyster), or live in holes in limestone or coral, etc., the eyes are atrophied. In the squid and other cephalopods they are large and as complicated as those of a fish. The eyes of the land snails are borne at the ends of the tentacles, but in burrowing marine gastropods they may be wanting through disuse, though present in the larvæ.

Our knowledge of the nature of vision in gastropod mollusks has hitherto been very scanty, no observations having been made since those of Lespès in 1851, until experiments by Willem brought out the following results: (1) Snails possess a well-developed power of touch, permitting them to perceive feeble jars of the soil beneath and slight movements of the surrounding media. (2) They see very badly and direct their movements principally by means of the senses of smell and touch. They form a confused image of large objects at an estimated distance of about a centimeter (.40 inch). They clearly distinguish the form of objects only at a distance of one or two millimeters. (3) The fresh-water snails do not have distinct vision at any distance. (4) There does not exist in mollusks a special vision of movements, such as insects possess. In general pulmonate mollusks respond to the action of light, in a degree differing in different species. They have dermatoptic perceptions, which vary much in intensity in different species. Organs of orientation, equilibrium, or hearing are the otocysts. In bivalves a single one is situated in the centre of the foot; in cephalopods they are large and placed one

behind each eye. The otocyst is a primitive form of ear, being a sac containing a minute particle of lime, the otolith. The sense of smell resides in the tentacles of the snail, the olfactory nerve branching out at the end. Also near the visceral ganglia is a group of sense cells (osphradia) supposed to be either olfactory or for testing the purity of the water entering by the respiratory current or, in snails, passing directly into the mantle cavity. Thus the organs of smell appear to be in all the forms represented by groups of specialized cells, which are persistent in nerve supply and position in all mollusks, showing that the sense of smell is all-important. Special organs of taste are as yet unknown in mollusks. Excretory organs are a single pair of highly modified tubes (nephridia) situated one on each side of the body just below the heart. See NERVOUS SYSTEM, EVOLUTION OF THE; EXCRETORY SYSTEM, COMPARATIVE ANATOMY OF THE; and similar titles.

The female ovaries and male reproductive glands are unpaired. The eggs are small and exceedingly numerous, and pass out in bivalves among the folds of the gills, where the young develop. The animal after hatching passes through a gastrula, trochosphere, and veliger stage, the last so called from the two ciliated flaps on each side of the head. Towards the end

LARVAL STAGES OF MOLLUSKS.

A, a trochosphere of the cockle (*Cardium*); v, ciliated crown; fl, flagellum. B, veliger stage, with the shell developing; v, velum; m, mouth; li, liver lobes; t, stomach; i, intestine; mt, mantle; f, foot; ml, muscle; n, nervous ganglion.

of the veliger stage the shell appears, arising from the incipient mantle as a cup-shaped body in both bivalves and univalves, but the hinge and separate valves are indicated very early in the Pelecypoda. In the young *Unio*, or freshwater mussel, the development history is more condensed. The velum is wanting or vestigial, and the young live between the gills of the parent fastened to each other by their threads (byssus). The shells (glochidium) are triangular, broader than long, with the apex hooked.

Fossil Mollusks. Remains of representatives of all the classes of mollusks occur in the lowest Paleozoic strata, having existed from the Cambrian period down to the present time. As they are so abundant, owing to their preservation as fossils (the shells in the absence of the animal being as a rule useful in classification), the mollusks are of great value as time marks and serve to distinguish the different formations.

The class which occurs fossil in the earliest (Cambrian) strata and concerning which there is no doubt is the Gastropoda. At the base of

the Cambrian (Olenellus zone) have been found the shells of such primitive gastropod genera as *Scenella*, *Stenotheca*, *Platyceras*, *Rhaphistoma*, and *Pleurotomaria*. The last-named genus is remarkable for having persisted to the present time, as it is still found at great depths in the Atlantic Ocean. More doubtful are the pteropods of the Cambrian, of the genera *Hyolithes*, *Forellella*, etc., though their shells are much more abundantly found than those of the Gastropoda proper. Of pelecypods the Cambrian forms are obscure and doubtful, the only ones yet found being a tiny little shell (*Modioloides*), and *Fordilla*, which may turn out to be the shell of a crustacean; and this group is comparatively rare even in the Ordovician strata. Of cephalopods the earliest known genus is *Volborthella*, a minute orthoceratite detected in the Lower Cambrian rocks of Finland and Esthonia and in the St. John group, Nova Scotia.

The Cambrian, Ordovician, and Silurian mollusks present (except in generic and specific characters) comparatively unimportant differences from living forms. The earliest known pelecypods were the forerunners of the Nuculidae; the earliest gastropods were *Pleurotomaria* and allied genera, some still living at great depths; the pteropods were in the main similar to existing forms, while the earliest cephalopods were the Orthoceratites, which are straight, uncoiled nautiloids. In tens of millions of years, therefore, the shelled mollusks have been one of the most numerous and characteristic groups of invertebrates, and became more and more differentiated and abundant in species, genera, and families as time went on; moreover, they are extremely abundant in the Mesozoic and Cenozoic eras, hence they afford unusually favorable data for the study of the phylogeny of both the chief and subordinate groups. This state of things was taken advantage of by Alpheus Hyatt in studies carried on for nearly 40 years, during which he applied the biogenetic law of Fritz Müller and Haeckel to the cephalopods, showing that the life of the individual during its rise and decline displays phenomena correlative with the collective life of the order to which it belongs. In these and similar studies he was followed by Wurtemberger and Neumayr. Their works on fossil cephalopods bear directly on such subjects as quick evolution, the effects of changes of environment, the action of use and disuse, acting throughout numberless generations. The facts gleaned from these mollusks also bear directly on the causes and mode of origin of the different classes, not only of mollusks, but of all other animal groups. The famous researches on the transmutations of the Tertiary shells of Steinheim by Hilgendorf and by Hyatt, those of Neumayr on the successive forms of *Paludina*, and the studies in the variations and evolution of other types by later authors, prove how valuable the shells of mollusks are in such studies.

For the uses by man of mollusks as food or ornament or money, see under CLAM; GASTROPODA; GILL; OYSTER; PEARL; PELECYPODA; SHELL MONEY.

Tryon, *Manual of Conchology, Structural and Systematic* (17 vols., Philadelphia, 1879-98); Fischer, *Manuel de conchyliologie* (Paris, 1883-88); A. H. Cooke, "The Mollusca," in the *Cambridge Natural History*, vol. iii (New York, 1895); Pelseener, *Introduction à l'étude des mollusques* (Paris, 1900); Josiah Keep, *West Coast Shells* (San Francisco, 1911). Morphological works of Owen, Gegenbaur, Huxley, Lamarck, Spengel, Lacaze-Duthiers, Bouvier, Bourne, Peck, Ihering, Brooks, Ryder, Hyatt, with monographs by Dall on deep-sea forms and numerous recent and fossil groups, by Binney, Verrill, Bush, Conrad, Kobelt, Pfeiffer, Martens, Reeves, Stearns, Chemnitz, Bourguignant, Pilsbury, and others.

MOLLWITZ, mōl'vits. A village of Prussian Silesia, in the Government of Breslau, 7 miles west of Brieg. To the east of it lies the battlefield where Frederick II of Prussia gained his first victory over the Austrians under Marshal Neipperg, April 10, 1741. The Prussian cavalry was thrown into confusion by the Austrian and put to flight. Frederick left the field at the earnest solicitation of Marshal Schwerin, who saved the day with the infantry after a five hours' battle. The Austrians suffered heavily in killed, wounded, and prisoners.

MOLLY MAGUIRES, mā-gwīrz'. A secret criminal order which existed in 1854-77, and possibly afterward, in the anthracite coal mining region of northeastern Pennsylvania. Here 400 collieries employed 60,000 men; Americans, Germans, Welshmen, Englishmen, and Swedes comprised in one-half the number, the remainder being Irish. Among the latter appeared the Molly Maguires, a branch of the Physical Force party of Ireland. The order is alleged to have been affiliated with the Ancient Order of Hibernians. About 1865 the Molly Maguires first became generally known as a dangerous organization. In 1875, having been instrumental in forcing a general strike in the coal regions, it succeeded in obtaining an ascendancy in the councils of the miners, and from that period was prominent in assassinations and other outrages, committed usually on the persons and against the property of justices of the peace, police officers, and mining bosses. Only Irishmen, or the sons of Irishmen, who professed the Catholic faith, were admitted to membership; but by the laws of the Church they could not remain Catholics in good standing. The order was organized in divisions, each having a chief official known as a body master; and there were signs and passwords to enable members to distinguish each other. These signs and passwords were given to the members by the body masters, who received them from the county delegate, who got them from the State delegate, to whom they were furnished by the national delegate or national board in New York City; to the latter they came quarterly from Ireland by the hands of the steward of one of the transatlantic steamships. A central and governing organization known as the Board of Erin held quarterly meetings in England, Scotland, or Ireland. The final exposure, capture, and punishment of the Molly Maguires were largely due to the energy and determination of Franklin B. Gowan, president of the Philadelphia and Reading Coal and

Iron Company, through the immediate instrumentality of James McParlan, a Pinkerton detective, who joined the Molly Maguires and became acquainted with their members and the secrets of their organization. Many members of the organization were apprehended, tried, and condemned, and their execution—that of a number of them occurring on the same day—so alarmed the members of the order that it ceased to have any extended influence. Consult: F. P. Dewees, *The Molly Maguires: The Origin, Growth, and Character of the Organization* (Philadelphia, 1877); Allan Pinkerton, *The Molly Maguires and the Detectives* (New York, 1878); J. F. Rhodes, "The Molly Maguires in the Anthracite Coal Region of Pennsylvania," in *American Historical Review*, vol. xv (ib., 1910).

MOLLYMOKE. One of the many variants of malleumuck. See FULMAR.

MOLMENTI, mōl-mān'tè, POMPEO GHERARDO (1852-). An Italian scholar, born in Venice. He studied law at Pisa and Padua and subsequently became professor of Italian literature at the Liceo Marco Foscarini. Almost numberless monographs on various aspects of Venetian history led up to his monumental *Storia di Venezia nella vita privata* (Bergamo, 1908-09; Eng. trans. by Brown, Bergamo-New York, 1908). For this work he was made Senator of the Kingdom.

MOLOCH, mō'lōk. See MOLECH.

MOLOCH, mō'lōk. An extremely spinose lizard (*Moloch horridus*) of Western and also South Australia, belonging to the family Agamidae (see AGAMA), and locally known as York devil or mountain devil. It is 5 to 7 inches long, broad and flat, and its thick skin is covered with spines and tubercles much like those of the American horned toad. This skin, which is yellowish, with reddish-brown blotches, is highly hygroscopic, absorbing water like blotting paper. It inhabits sandy districts, is quite harmless, and apparently lives entirely upon ants, which it catches in enormous quantities upon its long, glutinous tongue. Consult Saville Kent, *The Naturalist in Australia*. See Plate with article LIZARD.

MOLOCH, DER. An opera by Schillings (q.v.), first produced in Dresden, Dec. 8, 1906.

MOLOCHATES. See GEMS.

MOLO DI GIRGENTI, mō'lō dē jēr-jān'tè. The former name of Porto Empedocle (q.v.), a seaport in Sicily.

MOLOKAI, mō'lō-kī. One of the Hawaiian Islands (q.v.).

MOLOKANI, mō'lō-kā'nē (Russ. pl. of *molo-kanū*, from *moloko*, milk). A Russian sect. It is said the name was given them in derision by the orthodox because, unlike the latter, they do not observe fasts. They call themselves Spiritual Christians. They are rationalists, basing doctrine and practice on the Scriptures interpreted by the individual judgment. As a consequence much diversity of opinion prevails among them, a condition which they do not consider reprehensible. They take the early Apostolic Church as depicted in the New Testament for the model of their ecclesiastical organization and have no hierarchy or paid clergy. A presbyter and assistants are chosen from their own number to care for the spiritual and moral interests of the community. At their religious services, held on Sunday in private houses, as they are not allowed to build churches, they
